*Et même si ce n'est pas vrai,
Il faut croire à l'histoire ancienne.*

[And even if it is not true,
you need to believe in ancient history.]

LÉO FERRÉ

*Il est difficile de savoir si une interprétation
donnée est vraie, il est en revanche plus facile de
reconnaître les mauvaises.*

[It is difficult to know whether any particular
interpretation is correct—the bad ones are so
much easier to identify.]

Preface to the English Translation	xv
Translator's Preface	xix
Introduction: On the Trail of an Empire	1
1. Was There an Achaemenid Empire? 1; 2. From Alexander to Cyrus and Back Again: Fragments of <i>ego-histoire</i> 1; 3. The Historian and His Evidence 5; 4. Space and Time 9; To the Reader 11; Acknowledgments 12	
Prologue: The Persians before the Empire	13
1. Why Cyrus? 13; 2. The Founder Legends 14; 3. The Kings of Anšan 16; 4. Anšan and Susa 17; 5. Persian Society before the Conquests: Herodotus and Archaeology 18; 6. Anšan, Ecbatana, Babylon, and Susa 21; 7. From the Medes to the Persians 24; 8. Conclusion 27	
PART I	
THE EMPIRE-BUILDERS: FROM CYRUS TO DARIUS	
Chapter 1. The Land-Collectors: Cyrus the Great and Cambyses (559–522)	31
1. Medo-Persian Hostilities, the Defeat of Astyages, and the Fall of Ecbatana (553–550) 31; 2. The New International Situation and Cyrus's Projects 33; 3. The Defeat of Croesus and the Establishment of a Mediterranean Front 35; 4. Cyrus in Central Asia 38; 5. The Capture of Babylon (539) 40; 6. Cyrus, Trans-Euphrates, and Egypt 44; 7. From Cyrus to Cambyses 49; 8. The Egyptian Campaign (525–522) 50; 9. Cambyses and the Egyptian Traditions 55	
Chapter 2. The Conquest and After: An Interim Summary	62
1. From Cyrus to Darius: Sources and Problems 62; 2. Satraps and Satrapies 63; 3. Tributes and Gifts 67; 4. Continuities and Adaptations: The Case of Babylonia 70; 5. From Bactra to Sardis 76; 6. Persians and Conquered Populations 79; 7. The Seats of Power 84; 8. Royalty and Authority 89; 9. The King and the Gods 93; 10. Bardiya's Usurpation (522) 97	
Chapter 3. Trouble, Secession, and Rebuilding (522–518)	107
1. Darius Comes to Power (522) 107; 2. Revolts and Reconquests (522–518) 114; 3. The Aftermath of Victory: The Official Story 122; 4. Darius and the Six 128; 5. Summary and Perspectives 137	

Chapter 4. Darius the Conqueror (520–486)	139
1. The Pursuit of Territorial Expansion (520–513)	139;
2. The Persians in Europe	141;
3. The Ionian Revolt (500–493)	146;
4. From Thrace to Memphis (492–486)	156

PART 2

THE GREAT KING

Chapter 5. Images of the World	165
1. The Builder-King	165;
2. The King and His Peoples: Inscriptions and Iconography	172;
3. An Idealized Image of Space and Imperial Power	175;
4. Images and Realities: The King among His Peoples	183;
5. Images and Realities: The Imperial Festivals	195;
6. Royal Table and Royal Paradise: Exaltation of the Center and Appropriation of Space	200
Chapter 6. Representations of Royalty and Monarchic Ideology	204
1. Sources and Problems	204;
2. The Prince in His Own Mirror	210;
3. The King in Majesty	216;
4. The Good Warrior	225;
5. The King, the Earth, and the Water	232;
6. Between Men and Gods	240
Chapter 7. People and Life at Court	255
1. Sources and Problems	255;
2. Household Staff	258;
3. The Eunuchs	268;
4. The Women's Side	277;
5. At the Great King's Table	286;
6. The Royal Hunts	297;
7. Royal Pomp	299
Chapter 8. The King's Men	302
1. The Giving King	302;
2. Unequal Exchange	316;
3. The King and His Faithful: The Rationale of the System	324;
4. The King and His Faithful: The Dynamic of the Contradictions	331;
5. King and Satraps	338;
6. The King and His Faithful: The Persians, the Greeks, and the Others	347;
7. Achaemenid Royalty and Persian Aristocracy	352

PART 3

TERRITORIES, POPULATIONS, AND THE DEPENDENT ECONOMY

Chapter 9. Territories, Communication, and Trade	357
1. The Network of Roads	357;
2. Control of the Imperial Territory	364;
3. Lines of Communication and Trade	377
Chapter 10. Royal Assessments and Tribute	388
1. Sources and Problems	388;
2. Satrapies and Tributes	390;
3. Gifts and Tribute	394;
4. Tributes, Gifts, and Assessments	399;
5. Payments of Tribute: Metal and Coin	406;
6. The Administration of Tribute: Continuities and Adaptations	410;
7. Tribute Economy and Appropriation: Royal Land and Tribute Land	415

Chapter 11. Persia: Empire and Tribute Economy	422
1. The Persepolis Archives 422; 2. Administrative Hierarchy and Organization of Production 425; 3. The World of Work: The <i>kurtās</i> 429;	
4. Agriculture: Produce and Levies 439; 5. Lands and Estates 442;	
6. The Persepolis Tablets and the Imperial Administration: Sources and Problems 447; 7. The Management of Property and the Royal Warehouses in Egypt 448; 8. Management of Surpluses 451; 9. Lands and Peasants 456;	
10. The King's House 463; 11. Transition 471	

Chapter 12. The King of the Lands	472
1. Darius and Egypt 472; 2. Babylonia under Darius 484; 3. Trans-Euphrates 487; 4. From Jerusalem to Magnesia on the Meander 491;	
5. Western Asia Minor: Cities, Dynasts, and Empire after the Ionian Revolt 493; 6. Population Resettlement and Deportation 505; 7. Unity and Diversity 507	

PART 4

FROM XERXES TO DARIUS III: AN EMPIRE IN TURMOIL

Chapter 13. Xerxes the Great King (486–465)	515
1. Sources and Problems 515; 2. From Darius to Xerxes 518; 3. From Sardis to Sardis (480) 528; 4. Xerxes between Two Fronts (480–479) 531;	
5. The Persian Defeat: Its Causes and Consequences 535; 6. Xerxes and His Peoples 543; 7. Xerxes, Ahura-Mazda, and Persia 550; 8. Athenian Offensives and Royal Territories (478–466) 554; 9. Xerxes' Western Strategy 559; 10. From Xerxes to Artaxerxes 563; 11. An Assessment 567	

Chapter 14. From the Accession of Artaxerxes I to the Death of Darius II (465–405/404)	569
1. One King after Another (465) 569; 2. The Egyptian Revolt (ca. 464–454) 573; 3. Trans-Euphrates Matters 577; 4. The Asia Minor – Eastern Aegean Front 579; 5. Ezra and Nehemiah in Jerusalem 583; 6. One King after Another (425–424) 588; 7. Affairs on the Western Front 591;	
8. The Great King in His Countries 600	

Chapter 15. Artaxerxes II (405/404–359/358) and Artaxerxes III (359/358–338) ...	612
1. The Reign of Artaxerxes II: Sources and Problems 612; 2. The War of the Two Brothers (404–401) 615; 3. Artaxerxes the Victor 630; 4. Conditions in Asia Minor and Artaxerxes II's Strategy (400–396) 634; 5. Agesilaus in Asia Minor (396–394) 637; 6. Achaemenid Successes and Failures: From Asia Minor to Egypt (ca. 396 – ca. 370) 645; 7. Artaxerxes II, His Satraps, and His Peoples (ca. 366–359/358) 656; 8. At the Heart of Power 675; 9. The Wars of Artaxerxes III (351–338) 681	

PART 5
THE FOURTH CENTURY AND THE EMPIRE OF DARIUS III
IN THE ACHAEMENID *LONGUE DURÉE*:
A PROSPECTIVE ASSESSMENT¹

Chapter 16. Lands, Peoples, and Satrapies: Taking Stock of the Achaemenid World	693
Introduction: In the Steps of Alexander and on the Trail of Darius 693;	
1. Sources and Problems 696; 2. The Satrapy of Dascylium 697; 3. From Sardis to Ephesus 700; 4. From Celaenae to Halicarnassus 705;	
5. Pixodarus at Xanthus 707; 6. From Tarsus to Mazaca 709; 7. From Tarsus to Samaria via Sidon and Jerusalem 713; 8. From Gaza to Petra 716;	
9. Egypt from Artaxerxes III to Darius III 717; 10. From Arbela to Susa 719;	
11. The Great King, Alexander, and the Peoples of the Zagros Mountains 726;	
12. Persepolis, Pasargadae, and Persia 733; 13. From Persepolis to Ecbatana 737;	
14. From Ecbatana to the Halys 741; 15. From Ecbatana to Cyropolis 743;	
16. From the Punjab to the Indus Delta 754; 17. From Pattala to Susa and Babylon: The Persians and the Persian Gulf 758; 18. An Appraisal and Some Questions 762	
 Chapter 17. The Great King, His Armies, and His Treasures	 769
1. The Accession of Darius III 769; 2. The Great King and the Persian Aristocracy 780; 3. The Royal Armies 783; 4. Subject Populations and Tribute Economy 800; 5. Transition 812	
 PART 6 THE FALL OF AN EMPIRE (336–330)	
 Chapter 18. Darius and the Empire Confront Macedonian Aggression	 817
1. Territories, Armies, and Strategies 817; 2. Darius and His Faithful 842;	
3. The Local Elites, Darius, and Alexander: Popularity and Unpopularity of Achaemenid Dominion 852; 4. The Death of a Great King (330) 864;	
5. The Fall of an Empire 866	
 Conclusion: From Nabonidus to Seleucus	 873

Preface to the English Translation

The text of the book that is presented here to English-speaking readers differs very little from the French edition published by Éditions Fayard in June, 1996. Yet during the first stage in the process of translation, in the late 1996 and early 1997, I had hoped to make systematic modifications and additions to the original text in a way that took account of publications which had appeared after the latest revisions to the French manuscript, in September 1995.¹ A succession of delays in the preparation of the American translation dissuaded me from carrying out this enterprise, and here I would like to explain my decision to my readers.²

I have chosen to present updates and very detailed assessments of research in another form, the *Bulletin d'Histoire Achéménide* (BH*Ach*), organized in a way that follows the thematic structure of my book. Its aim is to give scholars periodic opportunities not only to become acquainted with recent bibliography, but also to have a critical analysis of it. The first number (BH*Ach* I) took the form of a long article published in Supplément 1 to the journal *Topoi* (1997, pp. 5–127).³ In it, I analyzed about 450 titles (articles and books) published between October 1995 and October 1997. The second *Bulletin* (BH*Ach* II) appeared in 2001, in book form.⁴ Following the same plan, I analyzed more than 800 titles published between October 1997 and October 2000. To make it easier to use, BH*Ach* II is accompanied by indexes which also cover the material in BH*Ach* I. One of those indexes (pp. 327–30) makes it possible for readers to find the pages in my 1996 book that need to be revised in the light of new publications. Furthermore, the recent creation of a website specifically devoted to Achaemenid research

1. I point out that Ursula Weber and Josef Wieschöfer have brought out an enormous Achaemenid bibliography, exhaustive and minutely classified (*Das Reich der Achaimeniden. Eine Bibliographie* (AMI, Ergänzungsband 15; Berlin: Dietrich Reimer, 1996).

2. A single significant addition has been made in the part of Chapter 9 devoted to customs and exchange: I have introduced an extraordinary document dealing with customs in Egypt, drawing on the main expositions and conclusions of the study by myself and R. Descat, "Un registre douanier de la satrapie d'Égypte," in N. Grimal and B. Menu, eds., *La commerce en Égypte ancienne* (IFAO Bibliothèque d'Études 121; Cairo, 1998) 59–104. Subsequently, I decided to stop introducing new material and discussion.

3. Supplément 1 to *Topoi* (distributed by Boccard, in Paris) included papers from a meeting organized at the Maison de l'Orient (Lyon), March 31–April 1, 1997, published under the title *Recherches récentes sur l'empire achéménide*. Almost twenty colleagues from various countries responded to an invitation from Jean-François Salles and Marie-Françoise Boussac to discuss my book, at that time newly published by Fayard.

4. *Bulletin d'Histoire Achéménide* II (Paris: Éditions Thotm, 2001), 334 pp. (see <http://www.thotm-editions.com/editions/bhachi102.htm>). This volume inaugurates a new series, *Persika*, undertaken on the initiative of the "Chaire d'histoire et de civilisation du monde achéménide et de l'empire d'Alexandre" with the cooperation of the Collège de France.

(www.achemenet.com) also gives scholars access to documentary and bibliographic resources on a continuing basis.⁵

I have discussed one of the methodological questions raised by a systematic update, a question that is not limited to Achaemenid studies, in the “Noruz Lecture” presented at the Foundation for Iranian Studies (Washington, D.C., March 23, 2001) under the title “New Trends in Achaemenid History.”⁶ There, with reference to the updates in *BHACH* I and II, I stated:

When one strives to follow and evaluate research and publication on a day-to-day basis and in an exhaustive manner, one unavoidably develops a permanent habit of painful epistemological questioning of the real results of the research. This question is particularly difficult to resolve in the Humanities, where accumulated erudition and bibliographic tautology sometimes take the place of evidence that is accepted but misleading for scientific innovation. To speak bluntly: what is really *new* in what is published *recently*? In our domain, what are the signs that permit us to assert that this or that study marks *progress* in the order of knowledge? The answer may seem easy as long as one is dealing with publications of documents, but it is quite a different matter when one considers interpretive publications. And even among publications of documents one has to make distinctions: some of them add only one unpublished document in a series that is already known, without modifying the general sense by much; others, on the other hand, call attention to documentation that in itself may suggest wholly new lines of interpretation.

Then, after presenting results from excavations at Ayn Manâwir in Egypt, I concluded:

In this respect, the discoveries and publications on Achaemenid Egypt that I have presented in brief are not just *recent*, they are really *new*, and they open prospects of fundamental new growth in the near future.

My point is that a thorough updating cannot be brought about in a satisfactory manner only with hundreds of bibliographic additions, heaped up one on the other. As publications accumulate, so the risk increases of burdening the text and the bibliographic notes with updates superimposed over one another, and of making the text more difficult to consult rather than more useful. Furthermore, in such a case the appearance of exhaustiveness would be largely an illusion, for two reasons. First, any book, however up-to-date its bibliography may be, is subject to some bibliographic lapse by the time it has appeared.⁷ Furthermore, as I have indicated, many added references really add

5. The creation of this web site also responds to purposes specific to the overall framework of Achaemenid history, that is, an aim to transform what has been a virtual scientific community into an actual scientific community: see my “Call for Collaboration” (Paris, 2000), available for downloading at <http://www.achemenet.com/pdf/call.pdf>, as well as the proceedings of a colloquium that I organized at the Collège de France, Dec. 15–16, 2000, “Achaemenid History and Data Bases on the Internet: an Assessment of Work in Progress and Prospects for Future Developments,” available at <http://www.achemenet.com/pdf/colloque/resumcs.pdf>. With the agreement of the editors of *Topoi*, the entire text of *BHACH* I can be found on the site at <http://www.achemenet.com/bibliographies/bhach1.htm>.

6. An English version is available at <http://www.fis-iran.org/achemenid.htm>; the French text is available at <http://www.achemenet.com/ressources/enligne/jasr/jasr01/htm> under the title “L’histoire de l’empire achéménide aujourd’hui: nouvelles tendances, nouvelles perspectives.”

7. By way of example, I may mention that as I write this preface, in early July, 2001, the provisional bibliographic list for *BHACH* III (which is intended to appear in 2003) already includes more than 150 titles, including some important books and articles.

nothing new, so it would be necessary to introduce a clear hierarchical distinction between “recent” and “new,” and to justify in detail the criteria for selection—precisely as I tried to do in my *Bulletins* of 1997 and 2001.

All this being so, I freely admit that taking into account the most innovative publications that appeared between 1995 and 2000 would make it possible to amend and detail many of the discussions in this book and to enrich significantly the iconographic documentation. If I have chosen nonetheless to present the American version practically in the same form as the initial French book, it is also because I have judged—whether rightly or wrongly the reader may decide—that the general image of the Achaemenid Empire that I expounded in 1996 has not been fundamentally modified.

Consider a particularly significant example, Chapter 16, in which I present a regional analysis of the empire and attempt an interpretation of relations between center and periphery, in the form of a prospective assessment (pp. 693ff.). The point of view that I adopt and defend there is that the documents discovered between about 1970 and 1995 put in serious doubt the “(pseudo-)statistical hypothesis of a scanty Persian presence and an inconsequential imperial occupation, based on bodies of evidence that are obsolete or reduced to a regional perspective” (p. 764). For this purpose, in the corresponding documentary notes (pp. 1029–1031) I present an assessment of recent discoveries, region by region. On the face of it, this section should be rewritten, since many new discoveries made available since 1995 ought to be included. But even if some discoveries treated in the 1996 version of the text remain under discussion,⁸ I believe that overall the documents published between 1995 and 2000 tend rather to confirm the historical interpretation that I presented in the book, whether in the matter of the maintenance of organic links between central authority and the provinces,⁹ or in the matter of the policy adopted toward local or national sanctuaries, or in the matter of the spread and adaptation of Persian imagery in various countries,¹⁰ or even in the matter of the economic condition of the empire at the arrival of Alexander.¹¹ At the same time, wherever one or another interpretation has given rise to reservations and/or polemics, the reader can easily come to grips with it by consulting *BHACH* I and II and the indexes of *BHACH* II.¹²

8. For example, concerning the interpretation of the Elamite tablets found in Armenia (French edition, pp. 962–63; below p. 938), see the treatments discussed in *BHACH* I, 25 and *BHACH* II, 44. The discussion is obviously not closed.

9. To take only one example, the discovery of settlements, qanats, and hundreds of demotic documents dated to the reigns of Artaxerxes I and Darius II at the site of Ayn Manâwir is particularly striking (see most recently *BIFAO* 100 [2000], 469–79, as well as the description of the work by Michel Wuttmann at <http://www.achemcnet.com/recherche/sites/aynmanawir/aynmanawir.htm>, and my remarks in *BHACH* I, 32–34 and 88–90, and II, 62, and in *Annales* 1999/5, 1130–35). The new discoveries tend to support the position that I took on pp. 520 and 1006–08 on the maintenance of links between the center and the Egyptian province throughout the fifth century B.C.

10. On these topics, to which I return at various points in the book, see now the specific treatments in *BHACH* I, 94–97, II, 176–184 (on religious policy), and I, 98–104, II, 911–206 (on the spread of images).

11. The discovery of a network of qanats at Ayn Manâwir also contributes to the discussion on pp. 000–000 about the relationship between the levying of tribute and investments in production, that is, about the economic rationality of the Achaemenid imperial system; see the studies collected in Pierre Briant, ed., *Irrigation et drainage dans l'Antiquité: qanats et canalisations souterraines en Iran, en Égypte et en Grèce* (Collection Persika 2; Paris: Éditions Thotm, 2001).

12. See especially *BHACH* II, 327–31: “Index des discussions”

In short, in order to be full and effective, a revision would have to be carried out on a strategy that is both selective and synthetic. But to do so would involve no more or less than writing a new book, or at least a fundamentally altered book.¹³ That is not the purpose of the American translation made available today. The purpose is simply to put before English-speaking readers a book that was published in French five years ago. My book of 1996 represents a state-of-the-question, valid at a given moment, of the work carried out by many scholars, as well as a the state of my own historical reflections. Readers of the French edition and of the American edition can easily avail themselves of the several reviews published since the appearance of the *Histoire de l'empire perse* in 1996.¹⁴ And if they want to know about the development of the author's thought, including his *pentimenti*, they can also consult the bibliographic tools that I have made available, as well as the updates that I have published, both on primary documents¹⁵ and on problems of historiography and method.¹⁶ I have no doubt that readers will be able to dispute the theses and interpretations of this book on the basis of their own thinking, but also in the light of publications that are recent and sometimes even publications that are new.

Paris, July 7, 2001

13. This is the consideration that eventually dissuaded me from introducing new and important iconographic documents that can be found with reproductions and commentaries in *BHArch* I (pp. 11, 16, 18, 21f., 26f., 34, 41, 67, 69, 74, 101) and *BHArch* II (pp. 34, 36, 40f., 43, 45, 47f., 58, 60f., 64, 69, 76, 110f., 116, 192, 195f., 198f., 202f., 205), though it would be technically simple to do so. The main and indispensable correction to illustrations in the French publication consists of adding to the list of illustrations (pp. xiff.) an indication of the source of the drawings reproduced here, unfortunately forgotten in the page proofs of the 1996 French version.

14. A list can be found in *BHArch* II, 9 n. 8. As usual, some are merely descriptive, while others present a deeper consideration of Achaemenid history today (see especially Matthew Stolper, "Une 'vision dure' de l'histoire achéménide (Note critique)," *Annales* 1999/5: 1109–26).

15. In particular, I have published drastic revisions of some Greek inscriptions pertinent to Achaemenid history, namely the inscription of Droaphernes and the Xanthus Trilingual in two articles published in 1998 ("Droaphernès et la statue de Sardes," in M. Brosius and A. Kuhrt, eds., *Studies in Persian History: Essays in Memory of David M. Lewis*, Achaemenid History, 11 (Leiden), 205–26; "Cités et sa trapes dan l'Empire achéménide: Pixôdaros et Xanthos," *CRAI*: 305–40) and the letter of Darius to Gatas in a study in press (available in pre-publication form at <http://www.achemenet.com/ressources/souspresse/manuscrits01.htm>). In the latter article I concluded that the document is a falsification, of Roman date, and I therefore propose that it should be eliminated from discussions of Achaemenid history. Given that this is one of the most celebrated documents in Achaemenid historiography, it is also one of the texts most frequently cited in my book (see the index, p. 000, s.v. ML 12). This last example shows clearly how difficult it would have been to patch up the original text in a satisfactory manner.

16. For example: "The Achaemenid Empire," in K. Raaflaub and N. Rosenstein, eds., *Soldiers, Society and War in the Ancient and Medieval Worlds* (Cambridge: Harvard University Press, 1998) 105–28; "L'histoire de l'empire achéménide aujourd'hui: l'historien et ses documents," *Annales* 1999/5, 1127–36; "Inscriptions multilingues d'époque achéménide: le texte et l'image," in D. Valbelle and J. Leclant, eds., *Le décret de Memphis* (Actes du Colloque de la Fondation Singer-Polignac, Paris 1^{er} Juin 1999) (Paris: de Boccard, 2000), 91–115; "Histoire impériale et histoire régionale. À propos de l'histoire de Juda dans l'Empire achéménide," in A. Lemaire and N. Saboe, eds., *Congress Volume Oslo 1998* (VT Suppl. 80; 2000) 235–45; "Darius III face à Alexandre: mythe, histoire, légende," *Annuaire du Collège de France, Résumé des cours et conférences 1999–2000* (Paris, 2000) 781–92 (also available at <http://www.college-de-france.fr/college/annuaire-scientifique/cours99–2000/briant/briant.pdf>); *Leçon inaugurale au Collège de France* (Paris, 2000).

Translator's Preface

What stretches before the reader is an almost exact equivalent of the 1996 French edition. This is not according to the original plan; the American edition was to incorporate the author's corrections, revisions, and additions reflecting subsequent Achaemenid research. With one exception, however, no supplementary material was received (for reasons described by the author above)—the exception being the discussion of the Aramaic customs document from Egypt discussed in chap. 9/3 (pp. 385–387). The author's bracketed added passages in the Research Notes, which were to be revised into the text, are marked with [[double brackets]]. Numbering of figures and maps in the original was somewhat erratic, so it diverges here.

This is not to say there is *no* difference; hundreds of Classical references have been corrected. Given worlds enough and time, many corrections could also have been made to the citations of the contemporary literature. In order to avoid as much as possible the pitfalls of indirect renderings, quotations from ancient sources have, when possible, been taken from published English translations (the mark ✧ appears in the reference for each such passage), rather than translated from the author's French renderings (forms of names in published translations have not been regularized. Only in a few cases, where the two versions are completely irreconcilable (or where the citation could not be matched with published translations), has a translation of the author's version been made.

The sources used are the following:

Biblical

Jerusalem Bible

I would like to express my gratitude to Larissa Bonfante, Professor of Classics at New York University, who provided access to many of the editions listed above; to Maureen Gallery Kovacs and Matthew W. Stolper for help with technical terminology, especially in numismatics and ancient economy and society respectively; and to sundry contributors to the newsgroup `sci.lang` for discussing some obscure French terminology. I have scrupulously maintained the author's distinctions between *ville* and *cit * ('town' and 'city'; see p. 377), and between *sanctuaire* and *temple*, at his request.

I am also especially grateful to my friend and publisher Jim Eisenbraun for commissioning this project in July 1996; after the French publisher's approval of the submitted specimen, translating began at the very end of that year and proceed during, roughly, the first halves of 1997, 1998, 2000, and 2001. Jim and his editorial staff made many improvements in the English style and French renderings; and Jim as book designer has as usual created a look that is both elegant and practical.

After not too many pages, the reader will discover that this is not a connected narrative history of the Persian Empire. Moreover, the reader is expected to be familiar with the narrative sequence of Achaemenid history, with the career of Alexander the Great, and with the entire Greek and Latin literature from which such histories have hitherto been drawn. The reader might find it useful to first turn to Joseph Wieseh fer, *Ancient Persia* (English translation, 1996) 1–101, for an overview that is thematically and conceptually remarkably similar to this work, and to the Chronological Chart therein for the sequence of events, as far as they can be determined. Only then, I think, can this book (whose aim, superbly realized, is to show just how a historian must evaluate and extrapolate from the available sources) be used with profit.

Clearly, this massive work represents only the first monument along the new highway through the crossroads of the ancient world.

PETER T. DANIELS
 New York City, March 2002

Introduction

On the Trail of an Empire

1. Was There an Achaemenid Empire?

The Achaemenid Empire: created by the conquests of Cyrus (ca. 559–530) and Cambyses (530–522) on the rubble and the fertile ground of the various kingdoms of the Near East, then expanded and reorganized by Darius I (522–486), for more than two centuries it extended from the Indus Valley to the Aegean Sea, from the Syr Darya to the Persian Gulf and the first cataract of the Nile—until the moment Darius III perished in a conspiracy, when his nemesis Alexander had already completed his conquest (330). The ordinary word *Empire*, as is well known, has no exact correspondence in any ancient language: the inscriptions of the Great Kings refer both to the land (Old Persian *būmi*) and to the peoples (Old Persian *dahyu/dahyāva*), and the Greek authors speak of ‘royal territories’ (*khōra basileōs*), of the ‘power’ (*arkhē*) of the Great King and his satraps, or again of “kings, dynasties, cities, and peoples.” The term *Empire* implies a territorial authority. This is in fact the basic problem posed by the origin and construction of the Achaemenid Empire. Marked by extraordinary ethnocultural diversity and by a thriving variety of forms of local organization, it evokes two interpretations: one that sees it as a sort of loose federation of autonomous countries under the distant aegis of a Great King, a federation that is evident solely from the perspective of tribute levies and military conscriptions; and another that without rejecting the evidence of diversity emphasizes the organizational dynamic of the many sorts of intervention by the central authority and the intense processes of acculturation. The direction in which my own preferences tend can be discerned even from this formulation of the problem—I will explain myself along the way. This in a nutshell is the aim of this book, which I now offer for the appraisal of my readers.

2. From Alexander to Cyrus and Back Again: *Fragments of ego-histoire*

This book was imprudently announced in a 1979 article but written between spring 1990 and spring 1993. I made limited revisions to the text and revised the Research Notes substantially in 1994 and 1995. But the conception and realization of the book, if only in a preliminary and preparatory form, goes back at least fifteen years, since it was in about 1982–83 that I began to jot down for myself the initial drafts, sketches, and plans that are now relegated to dead files. By way of a contribution to a genre that is fashionable (at least in France), *ego-histoire*, and coming straight out of the introduction I wrote in 1982 for my collection of articles (*RTP*), I would like to explain this book’s origins in a personal way.

Nothing predisposed me to devoting the greater part of my life to researching and teaching Achaemenid history. When I was a historian-in-training, stirred by ancient history during my studies at Poitiers, it was almost by chance, or more exactly because of a

comment by H. Bengtson, that I began to take an interest in one of the successors of Alexander, the former satrap of Greater Phrygia, Antigonus the One-Eyed. That interest took shape as a thesis prepared under the supervision of Pierre Lévêque. A well-known passage in *Life of Eumenes* (5.9–10) regarding the machinations of Antigonus's opponent in the environs of Celaenae, capital of Greater Phrygia, led me to ask questions about the status of the land and the peasants at the very beginning of the Hellenistic period—investigations that I developed into an article about these peasants (*laoi*) of Asia Minor (1972). The first step had been taken: I had settled on the Near East (Asia, as I called it then, following the Greek authors), but a Near East revisited by Greco-Macedonian armies and by ancient and modern colonial historiography.

The preparation of a long article on Eumenes of Cardia (1972–73) and of a small book on Alexander (1st ed., 1974) quickly convinced me of the need to go further back in time. Just what was this Achaemenid Empire, which was perennially accused of decadence without being put in its historical context? I had always been struck by the fact that certain overeager epigones, following Droysen (who deserved less dogmatic disciples), insisted unequivocally that the Macedonian conquest had shaken up the political, economic, and cultural structures of “Asia” from top to bottom; but, at the same time, what came before Alexander was never defined except as a foil to what came after. These inquiries led me to take as my first object of study the populations of the Zagros, whom the ancient authors presented as brigands who were unconcerned with agriculture and therefore “naturally” aggressive (1976). I came to realize with more and more conviction that our entire view of the Achaemenid Empire and its populations was corrupted by the distortions perpetrated by the ancient historians of Alexander. At the same time, it seemed to me equally evident that the historian could not avoid recourse to these same sources. I continued to plow this furrow for several years, and to some extent this book is intended as a contribution toward answering an ancient question: why did the Achaemenid Empire fall to the blow of Macedonian aggression?

But the chosen title is not simply a reflection of this veritable obsession or, if I may say so, of this long “quest for the Holy Grail.” It is also meant to express a long-held and long-nourished conviction: Alexander and his successors took over much of the Achaemenid system, a conclusion that I have often expressed with the formula “Alexander, last of the Achaemenids.” Like any formula, this one has its limits and gives rise to contradictions of its own. Yet when all is said and done, it seems to me all the same to express the extraordinary continuities that characterize the history of the Near East between the conquests of Cyrus and the death of Alexander. Heinz Kreissig, from whom I have learned a great deal, used the phrase “orientalischer hellenistischer Staaten” to describe this continuity. The Seleucid kingdom was in his eyes an obvious manifestation of it. The word *continuity* should not be misleading: it is not meant to deny the accommodations and adaptations brought about by the Macedonian conquest. But, at the same time, recent research makes it ever clearer, for example, that the Seleucid empire, in its origin and its constituent elements, was a branch grafted directly onto Achaemenid stock.

During the 1970s, and still more at the beginning of the 1980s, the realization dawned on me more and more clearly that, however indispensable the Classical sources were, they could not by themselves answer the questions I was asking. I needed to penetrate the Achaemenid essence more intimately, a task for which I was not at all prepared. Luckily, I had already had some decisive encounters. First, Roman Ghirshman, who

around 1972 had strongly encouraged me to plow my Achaemenid furrow: I could never forget the generous concern he showed me without fail until his death in 1979. Around 1977 (if I remember correctly), I made contact with Clarisse Herrens Schmidt, who, if I may say so, "initiated" me into the royal Achaemenid inscriptions. During the 1970s, I also struck up contacts that have continued uninterrupted ever since with the Italian group led by Mario Liverani and sustained by his work and the work of his students: Mario Fales, Lucio Milano, and Carlo Zaccagnini, with whom I shared and still share thematic interests and conceptual approaches. The conversations that I have continued to have with them, as lively as they are frequent, have helped me put the Achaemenid case in the broader context of first-millennium Near Eastern history, and thus better to take into account the Assyro-Babylonian heritage in the structures of the Achaemenid Empire.

It was around 1977–78 that Jean-Claude Gardin, who was then leading explorations around the Hellenistic town of Ai-Khanūm in Afghanistan, invited me to join his team. He had invited me to participate in their discussions as a historian and to contrast the textual record and the archaeological record. Though I was not able to take part in the field-work (soon interrupted for reasons known to everyone), I learned about the tremendous contribution of archaeology and also about the interpretive challenges that it poses for the historian more familiar with a text of Arrian than with the "trash cans" full of sherds. This collaboration led me to publish a book in 1984 on the relationship between Central Asia and the kingdoms of the Near East, situated first and foremost in the context of Achaemenid history. The debate, which I was able to pursue thereafter, was extremely rich in ensuing discussions. The reader will observe in due course that disagreements among us persist. The methodological problem remains: how can we reconcile the archaeological picture and the textual picture, which seem to engender two different conceptualizations of the Achaemenid Empire? It will also be seen that this debate is not limited to the local context of Bactria.

During the second half of the 1970s, when I had finished my study of the "brigands" of the ancient Zagros, I also had frequent exchanges with anthropologists who specialized in pastoral nomadism, in particular with Jean-Pierre Digard, whose Bakhtiari were contiguous with "my" Uxians. This collaboration, pursued over several years, led to the writing of a book on the anthropology and history of the pastoral peoples of the Near East (1982b). It also touched on the problem of relations between center and periphery both in the Achaemenid Empire and in its Assyro-Babylonian predecessors and its Hellenistic successors.

In my intellectual history, the year 1983 is marked with a gold star. It was then that I participated for the first time in an Achaemenid Workshop at Groningen, at the invitation of Heleen Sancisi-Weerdenburg, who, soon joined by Amélie Kuhrt, had launched a series that was to continue until 1990 in Ann Arbor (there in collaboration with Margaret Root). For the first time, I felt that I was not working alone, self-taught concerning the subject matter of my main objective. Now I could join the "Achaemenidist community," which, small in number, offers the inestimable advantage of being international and linked by bonds of friendship. I could then carry on discussions more systematically on a historical problem clearly posed by the organizers and on a corpus of evidence as varied as were the components of the Empire. The numerous relationships that I was able to form during and outside these meetings were crucial for me. The initiative of

Heleen Sancisi-Weerdenburg and Amélie Kuhrt gave a radically new impetus to Achaemenid research. On the model of the Achaemenid Workshops, Clarisse Herrenschildt and I organized a conference on tribute in the Persian Empire; Pierre Debord, Raymond Descat, and the administration of the Centre Georges-Radet of Bordeaux set up two meetings, one on Asia Minor and one on monetary problems; Jean Kellens organized a colloquium at Liège dedicated to Persian religion; Josette Elayi and Jean Sabin organized three meetings on Syria–Palestine under the dominion of the Great Kings; and I organized a conference at Toulouse on the *Anabasis* of Xenophon, the proceedings of which have now been published (1995b). In short, the Groningen initiative set in motion intense scholarly activity and a sizable output of first-rate articles, whose regular publication in the series *Achaemenid History* as well as in many journals fostered and stimulated discussion and debate periodically—to such an extent that the exponential growth of the bibliography sometimes gave me a feeling of powerlessness and discouragement. As much as this book may be very personal work, it also reflects (or is meant to reflect) the richness and productivity of a field of research that had long remained partially fallow. In using this expression, I do not mean to minimize the importance or the scope of the work that the history of ancient Iran evoked over a long period and that I have carefully taken into account. What I want to say is simply that, taken in its entirety and not reduced to the study of a few major sites (Susa, Persepolis, Pasargadae), and despite the attempt at synthesis by Olmstead in 1948 that continues to deserve our respect, the history of the Achaemenid Empire remained largely *terra incognita*. It had been abandoned both by Assyriologists (for whom the fall of Babylon to Cyrus in 539 long marked the end of history) and by Classicists (who “kidnapped” Near Eastern history as of Alexander’s landing in Asia in 334). In a way, squeezed between “eternal Greece” and “the millennial Orient,” tossed between Hellenocentrism (from Aeschylus to Alexander) and Judeocentrism (Cyrus refracted through the prism of the Return from the Exile), Achaemenid history did not exist as a distinct field of study. The initiative of Heleen Sancisi-Weerdenburg and Amélie Kuhrt thus brought Achaemenid studies securely back within the field of history, the way marked out by a set of problems whose terms and stakes I recognized all the more easily because I had begun to try to define them on my own.

There remains one aspect of my *ego-histoire* that I would like to broach quite frankly, as I have done on several occasions now and then in the last few years in publications and private conversations with colleagues and with students. The written sources for Achaemenid history are found in an extraordinary variety of languages: Old Persian, Elamite, Babylonian, Egyptian, Aramaic, Hebrew, Phoenician, Greek, and Latin, not to mention Lydian, Lycian, Phrygian, Carian, or any other yet-to-be-deciphered language. I must state at the outset that in no way am I a specialist in any of these languages. I can barely claim competence in Greek and Latin. This might be thought an insurmountable handicap. But though the term *handicap* expresses a reality that is beyond question, I do not think that the adjective *insurmountable* should be taken literally. To justify this position, I need to explain my working method. First of all, there are accessible translations of the basic texts, whether the royal inscriptions, selected Elamite tablets, Aramaic documents from Egypt or elsewhere, a certain number of Babylonian tablets, or hieroglyphic inscriptions—to give only a sampling of the available resources. But to use the texts in translation is not enough. It is necessary to turn to the original texts, at least the

most important of them. Many documents that have been published in transliteration can be put to this use. There even a self-taught historian is able to identify what I will call the landmark words or the key words that give the text its sense. At this point one must turn to an exhaustive study of the philological literature, however difficult it may be. This is what I have tried to do, as systematically as I could. That is why, here and there, I have allowed myself to enter discussions and debates that in principle my linguistic and philological ignorance should prohibit me from approaching. From time to time I may propose that the historian's suggestions provide independent confirmation of a philological interpretation. And then, when a problem appeared that I found insoluble, I often have had recourse to the advice and counsel of friends and colleagues, who have not been stingy with their wisdom. How many e-mail messages have I exchanged with Matt Stolper, for example, about Babylonian tablets of the Achaemenid era? It should be clearly understood that I am obviously not endorsing ignorance. I cannot fail to recognize the limits of self-instruction. It would be a miracle to possess simultaneously a historian's training and immediate access to all the languages of the Empire. Unfortunately, as far as I know, such a rare bird does not exist—at any rate, neither my warble nor my plumage permits me to claim such a distinction!

In spite of all the precautions I have deployed, I still recognize the risks I have assumed in offering a book that—legitimately or not—claims to be exhaustive. As a result of my own failings, of unequal access to the corpora of documents, of the persistent and increasing breadth of the debates, or even of the uneven progress of thematic and regional studies, the word *exhaustive* can provoke confusion or laughter. The problem is that, from the moment I began this undertaking, I was stuck with a sort of encyclopedism, with all the risks and illusions that go with such an approach. I did not have the liberty of sidestepping some discussion or other, out of my own interest in this or that question, or out of my own limited familiarity with this or that corpus. A work of synthesis of this kind necessarily requires that the author tackle every aspect and component, whether political, ideological, socioeconomic, religious, cultural, etc., and attempt to integrate them, insofar as it is possible, into a general interpretation. I have thus had to consult all the dossiers of evidence, but I have also had to leave them only half-explored. In some areas, the breadth and complexity (not to mention the contradictions) of the discussions among specialists in this or that corpus has not resulted in well-defined positions on my part (I have in mind, *inter alia*, the exegetical and historical disputes about Ezra and Nehemiah). On the other hand, the reader will find, at least in the Research Notes, a “state-of-the-art”—that is, not just a bibliography but also and especially the reasons for the differing interpretations. In other cases, I have taken a firmer position and proposed my own interpretations. I hope that this book will thus give rise to new specialized investigations, which will, without doubt, reopen discussion on many interpretations that I have often presented in the explicit form of alternative suggestions.

3. *The Historian and His Evidence*

One of the most remarkable peculiarities of Achaemenid history is that, unlike most conquering peoples, the Persians left no written testaments of their own history, in the *narrative* sense of the word. It is noteworthy that unlike the Assyrian kings, the Great Kings had no Annals prepared where the memory of their mighty deeds on the battlefield or in the hunt could be made heroic and preserved. We have no chronicle prepared

by a court scholar at the command of the Great Kings. To be sure, according to Diodorus (II.32.4), Ctesias—a Greek physician in the court of Artaxerxes II, author of a *Persica*—boasted of having had access to “the royal records (*basilikai diphtherai*), in which the Persians in accordance with a certain law (*nomos*) of theirs kept an account of their ancient affairs.” However, there is not another shred of evidence of such Persian historical archives, aside from a late and suspect tradition that attributes their destruction to Alexander. The archives referred to by the editor of Ezra (6:1–2), for example, were, rather, administrative. In these satrapal and/or royal archives (*basilikai graphai*; *karammaru ša šarri*) is preserved the written record of the most important decisions (land grants and reassignments, for example, and also fiscal documents). It is perhaps to such documents (found in several satrapal and/or imperial capitals) that Herodotus had access in composing his well-known tribute list, but it is not out of the question that the historian from Halicarnassus collected his administrative data himself in interviews, a method mentioned on many occasions in his work. It is far more likely that at least in the *Persica* Ctesias relied on oral testimony, as explained by his epitomizer, Photius (*Persica*, §1). This is certainly how Herodotus, Ctesias, and several other Greek authors heard and retransmitted the different versions of the legend of the founder, Cyrus. The edifying tales of royal virtues were diffused throughout the Empire from the point of view of “educated people” (cf. Diodorus II.4.2); hence the interest that attaches, for example, to the Achaemenid tales told by a late author, Aelian, who clearly takes his information from Herodotus himself or from courtiers like Ctesias. From this point of view, the most striking example is a passage in which Polybius (X.28) transmits in writing an Achaemenid administrative datum of the greatest interest that the Hyrcanian peasants had preserved in their collective memory for generations. By a series of extraordinary coincidences, a royal archivist or memoirist happened to be present when, at the demand of Antiochus III, the heads of the Hyrcanian communities recounted the privileges they had enjoyed since the time “when the Persians were the masters of Asia.” It must be stressed that the information would have been totally lost if it had not had immediate relevance in the course of a military expedition mounted by the Seleucid king in Central Asia. Polybius found the report in a work that is now lost.

We dare not underestimate the importance of oral tradition in the lands of the Near East. It was in oral form, in songs and recitations, mediated by the “masters of truth,” the *magi*, that the Persians themselves transmitted the deeds of their kings and the memory of mythic heroes from generation to generation, and the young in their turn became the repositories of these oral traditions. In the collective imagination of the Persian people, history was conflated with its mythic expression and, in the royal pronouncements, with the genealogy of the dynasty. With the partial exception of the monumental trilingual inscription that Darius had engraved on the cliff at Behistun, the royal inscriptions are not narrative accounts: there is not a single direct reference to conquests or military expeditions in them. Rather, they celebrate the omnipotence of the great god Ahura-Mazda, the transhistoric permanence of the dynastic principle, and the incomparable brilliance of the royal virtues. The Book of Benefactors, to which Herodotus (III.140; VIII.85–86) and the composer of the book of Esther (6:1) allude, is no exception. It was a compilation of the names of persons who had rendered conspicuous services to the Great King and who (as such) could expect a royal gift; it therefore also had a place in the exaltation of the sovereign power. Achaemenid court art itself did not have a narra-

tive purpose. Power and the King were represented in timeless attitudes, not a particular king in a historical situation; this holds true for royal images found on stone, coins, and seals as well. Written in the immovable and infinite time of the King, the history of the Persians was never situated in the measured time of History by the Persians themselves.

The Great Kings and the Persians thus left the control of their historical memory to others. Here is an extraordinary situation: one must reconstruct the narrative thread of Achaemenid history from the writings of their subjects and their enemies—hence the power and authority long ascribed to the Greek authors. It is readily understandable that most of them wrote books devoted to memorializing the Greeks; and in the Athens of the fifth and fourth centuries, this memorial was constructed to a great extent on the carefully laid foundation of remembrances of confrontations with the Persians and victories won over the “barbarians of Asia.” Among these authors, there is one who holds a special, preeminent place: Herodotus. In contrast to most of his contemporaries, he shows no evidence of systematic hostility to the Persians—hence the accusation directed against him by Plutarch of being a ‘friend of the barbarians’ (*philobarbaros*). The object of his *Histories* is to understand and explain the origins, however distant, of the Persian Wars. This gives us the advantage of lengthy digressions in the form of flashbacks on the history and institutions of many peoples and kingdoms of the Near East, Egypt in particular. It also gives us the advantage of interesting chapters on events in Persian history: the conquests of Cyrus, the seizure of Egypt by Cambyses, the accession of Darius, the reforms he introduced in tribute organization, as well as a digression on the internal organization of the Persian people and their principal social customs, and, of course, very long accounts of the Ionian Revolt (ca. 500–493) and the Persian Wars (490–479). In spite of its gaps and deficiencies, the abrupt end of the *Histories* in 479 leaves the historian of the Achaemenid Empire something of an orphan. Among Herodotus’s successors, Thucydides has only a very peripheral interest in the Achaemenid Empire; as for Xenophon and Diodorus Siculus, their unbalanced approach tends to lend disproportionate weight to the Mediterranean side. Aside from the *Anabasis* of Xenophon, it was not until Alexander’s expedition that the ancient historians penetrated the depths of the imperial territories, following in the footsteps of the conqueror.

Finally, many ancient authors devoted works specifically to Persia, which are called the *Persicas*. But most are lost and known only from fragments (quotations in later authors). The longest preserved fragment is the patriarch Photius’s summary of the *Persica* of Ctesias. It is disappointing to read. The author, who lived some fifteen years at the court of Artaxerxes II, transmitted nothing but a slanted view dominated by the tortuous machinations of wicked princesses and the murky conspiracies of crafty eunuchs. He is undoubtedly one of the chief culprits in the success of a very incomplete and ideologized approach to the Achaemenid world. His *Persica* is not without some adumbration of the “Orientalism” of the modern period, which analyzes the courts of the Near East through a haze of very debatable readings, permeated mostly by observations on the murmurs of the harems and the decadence of the sultans. As for Xenophon, he wrote a long historical romance, the *Cyropaedia*, dedicated, as indicated by the title, to the education of the young Cyrus. The “Cyrus” he presents is certainly not the historical Cyrus; but he is a sort of paradigmatic embodiment of royal virtues. It is necessary, then, at each step, to distinguish the kernel of Achaemenid facts from the Greek interpretation—not always an easy task. It comes as no surprise that, generally speaking, the Greek

authors transmitted a very Hellenocentric vision of Persian history and customs, just as certain books of the Bible, namely Nehemiah, Ezra, Esther, and Judith, provide a uniformly Judeocentric approach. But historians cannot choose their sources: given the available evidence, we have no choice but overwhelming reliance on Greek historiography to reconstruct a narrative thread. However much one may rail, not to say become frustrated, at the nature of their works, the situation becomes even more awkward when one must do without them! What is more, one must not throw out the baby with the bathwater: some late authors (Athenaeus, Aelian) have preserved a great deal of information about the person of the Great King and court life which, once it has been decoded, allows the historian to decipher what was also an *Empire of signs* (cf. chapters 5–7). From a methodological point of view, this book and the interpretations in it are thus largely the result of a labor of deconstruction of the Classical texts through which I have tried to show that, however partisan and ideological a Greek text may be, when it is located in the web of its associations, it can provide a stimulating Achaemenid reading. Furthermore, the historical and historiographical status of royal pronouncements and images requires exactly the same approach.

Fortunately, we also have records from the central authority: the royal inscriptions truly mirror the vision the Great Kings had of their power, their virtues, and their imperial reach; they also furnish information of the greatest importance on their building activities. But without doubt the most important find has been large groups of archives written on clay known as the Persepolis tablets, written in cuneiform in an Elamite that is riddled with Persian words. They provide a bureaucratic and “paper-shuffling” picture of the imperial administration that could scarcely be guessed from the Greek sources but would scarcely come as a surprise to the heirs of Assyro-Babylonian tradition. It is the same picture that the many Aramaic documents found in Egypt convey. Some royal and satrapal decrees are also known from translations into various languages of the Empire: these include a letter copied in Greek from Darius to Gadatas, one of his administrators in Asia Minor, and the correspondence in Demotic between Pharaohs, satrap of Egypt, and the administrators of the sanctuary of the god Khnūm at Elephantine. As a whole, this documentation shows both the many ways in which the central authority intervened in local affairs and the persistent multilingualism of the Empire, tempered by the widespread use of Aramaic. To these written documents must be added the considerable evidence from archaeology, iconography, and numismatics, from the Aegean to the Indus, that has been discovered and published.

When the iconographic evidence, whether monuments or minor arts, in the royal residences or from the provinces, is added to the written sources (royal inscriptions; Elamite and Babylonian tablets; inscriptions in Phoenician, Aramaic, or Egyptian, Lydian and Lycian, or more than one language; Aramaic papyri; Classical authors, etc.), the historian has access to documentation that is both impressive and varied. But even when these varied corpora are brought together, they suffer from a dual handicap: they are very unevenly distributed in space and time. Some portions of the Empire, especially the satrapies of the Iranian Plateau, Central Asia, and the Indus Valley, are virtually devoid of any written documentation. It is not until the conquest of Alexander that we have even minimal literary information; hence the overpowering weight of archaeological evidence, which poses its own considerable interpretive difficulty. Some regions, on the other hand, are extraordinarily well documented: aside from Persia itself (the Elamite

tablets), we may specifically mention *Susiana* (both textual and archaeological evidence for royal building projects), Egypt (Aramaic documents from Elephantine and Saqqara, Demotic papyri, hieroglyphic inscriptions), Babylonia (thousands of tablets), and, obviously, Asia Minor (not only the Greek historians, but also late evidence in Greek, Aramaic, or Greek and Aramaic of the imperial Persian diaspora in Anatolia). Furthermore, the information from some provincial sites assumes special importance. This is true of Xanthus in Lycia, where the dynasts continued to build monuments of a different kind that regularly display both inscriptions in Lycian and Greek and court scenes whose iconographic repertoire testifies to Achaemenid influence. A written document of the greatest importance was discovered there in 1973: a stela with a text in three versions—Aramaic, Lycian, and Greek—that immediately became famous. It is now securely dated to the first year of Artaxerxes IV (338–336), a Great King of whom virtually nothing was known until then, apart from the name (Arses) regularly given him by the Classical sources (Aršu in Babylonian). For all of these reasons, I will frequently tarry at Xanthus, which appears to the historian as a sort of microcosm of Persian power in a regional subdivision of the Empire for the entire time from Cyrus to Alexander. At the same time, the example shows the interpretive difficulties that arise from the dominance of archaeological and iconographic sources.

The evidence is distributed as unevenly in time as it is in space: the documents from the central authority are concentrated to a striking degree within the period from the conquest of Babylon by Cyrus to the middle of the fifth century, the date of the last Persepolis documents; we can hardly expect to derive a complete history from the evidence of this single period. The reigns of Artaxerxes I (465–425/424) and Darius II (425/424–405/404) remain fairly well documented, thanks to late documents from Persepolis, the Murašû archives in Babylonia, and Aramaic documents in Egypt. Otherwise, from Artaxerxes II (405/404–359/358) on, the historian must resort, at least for the basic facts, to the reports of the Greek authors. But, as we have said, their attention is focused on the Aegean coast, military-diplomatic matters, and court intrigue. Not until Darius III (335–330) do we find more abundant documentation, namely the Alexander historians who constitute, as I shall show (chapters 16–18), an “Achaemenid” source of exceptional interest, once they have been decoded.

4. *Space and Time*

The above observations immediately reveal the great difficulty faced by anyone who intends to write an analytical synthesis of the Achaemenid Empire. It must embrace a diachronic approach, a synchronic vision, and regional distinctions all at the same time. Though a single entity, the Empire had multiple manifestations because of its longevity and because of the great variety of the lands and cultures it comprised. Thus the tyranny of the document reemerges. How can one compose a global history of the *longue durée*, when the most significant evidence is limited to a few decades and/or a few areas? For the same reasons, where, how, and with what justification can we establish chronological divisions that express an endogenous, ascertainable, and verifiable development? There is no reason to overlook the breaks marked by the death of a king and the accession of his successor, but one cannot attribute to them a determinative explanatory value because, whatever the recognized central position of the Great King, the pulse and breath of the history of the Empire over the *longue durée* cannot be reduced to incidents

of dynastic history. Consequently, it is necessary to interrupt the chronological thread with thematic chapters.

Despite the inauspicious distribution of the evidence, I have taken the risk of writing a general history in all of the aspects that I have listed. *Risk* is a bit pretentious because I have defined the several parts of the book mostly according to the distribution in time and space of all of the different kinds of evidence. What I am trying to say is that I have attempted to restore a full measure of importance to the fourth century, whose development is too often misunderstood and treated superficially at the expense of surrendering the power of memory to the Greek polemicists and so rendering the end of the story unintelligible. I do not claim that the history in the chapters below (particularly chapter 15) is not primarily political, military, and diplomatic. It might be considered hard, even tedious, reading. But, on the one hand, to reprise a formula that I will repeat many times, historians cannot choose their sources. On the other hand, I hold as do others that there are no minor genres of history: in a history of a state built and destroyed by conquest, it would be unreasonable not to devote sustained attention to armies and military expeditions. In the end, the study of war cannot be reduced to the caricature sometimes made of it with the pejorative label "battle-history." War is especially revealing of the workings of a state, even if it only reveals, for example, the scale of mobilization of human, material, and technological means of production that it both presupposes and imposes.

In order to highlight diachronic development more clearly, I have periodically provided an overview of the Empire, taken in its regional or even microregional components (chapters 13/6–7; 14/8; 15/7). I have also drawn up some more general assessments at three key points. The first is at the death of Cambyses (522), to distinguish what is attributed to the first two kings from what must be attributed to Darius (chapter 2). I have also made an assessment, which is meant to be exhaustive, at the end of the reign of Darius. Several long chapters (6–12) will perhaps provoke some criticism because of the use of later sources for the early fifth century, but I try to explain on several occasions the reasons for my choice. The third general assessment occurs toward the beginning of the reign of Darius III, and it includes the entire fourth century. Its purpose is to take stock before the appearance of Alexander and better to assess what we have fallen into the unfortunate habit of calling "Achaemenid decadence (decline)." The reader will find there an overview of the peoples and countries of the Empire that is as complete as possible, without claiming to have exhausted the literature. This inventory is not confined to an analysis of the administrative organization; the longest passages are devoted to the analysis of intercultural relations (chapter 16). The assessment is filled out by a dynamic analysis of the central state apparatus (chapter 17). For reasons I will set forth in the proper place, in the introduction to part 4, such an assessment allows us to approach the last phase of Achaemenid history on a more solid basis: strictly speaking, the last chapter (18) is not about the conquest of Alexander but about the wars waged by Darius and the Empire against Macedonian aggression and about the response of the imperial elite to the general challenge of the Macedonian conquest. Conquest, resistance, and defection in turn eloquently reveal the state of the Empire when Darius perished in a conspiracy in the summer of 330.

To the Reader

Whatever the origin and nature of the evidence at hand, history is simultaneously both explanation and interpretation. It is thus appropriate that the reader be informed about the sources that justify the author's interpretive choice. As a guide at each step of the way, I attempt to provide an inventory under the title "Sources and Problems." For the same reasons of clarity and rigor, I give frequent and sometimes lengthy quotations of ancient texts. By way of support for the explanation and the argument, I have also included archaeological and iconographic evidence. In this way, I hope, readers will be clear about the path I have followed, the evidence that justifies and supports it, the arguments I bring into play, and the worth of the interpretations I propose. They will have before their eyes all the elements that will permit them to conceive and/or propose alternative solutions. However much references to ancient sources may seem to burden the main text, I have found it necessary to provide them in parentheses, so that readers may look them up immediately, if they wish to examine, verify, or dispute them on the spot. I have also provided many subheadings—informative ones, I hope—so that readers can find their way easily through this substantial tome. And finally, I have deliberately banished the reference and explanatory notes to the back of the book, not only because some are very long and very detailed but also and especially because I hope that in this way the book will be more easily accessible to students and nonspecialists, who are rightly put off by the display of a sometimes over-erudite critical apparatus. Those who are interested are free to turn to the research appendix, like the specialists.

Acknowledgments

I must first express my deepest gratitude to all those who have supported and stimulated me through these years and lifted my spirits when I became discouraged. I do not know whether I would have begun without their stimulation or whether I would have persevered with such an ambitious undertaking.

I thank all those who have been so kind as to provide me with advance copies of manuscripts that were in the course of publication.* Nor can I forget the exceptional access provided by Bernard Delavault and Alban Dussau, *chargés* of the Semitic and Assyriological libraries of the Collège de France, respectively, whose Egyptological collection I consulted just as diligently. I recall that the Conseil scientifique of my university kindly granted me a sabbatical year. I also extend a tip of the hat to all of the students at Toulouse who for years have listened to my musings aloud in front of them and whose questions have often helped me clarify my thought. I think also of Sandra Péré (Toulouse) and Wouter Henkelman (Utrecht), who were of indescribable help in preparing the indexes; I took care of the subject index and general coordination, and obviously I take final responsibility for them all.

My friends Amélie Kuhrt (London), Heleen Sancisi-Weerdenburg (Utrecht), Matt Stolper (Chicago), and Carlo Zaccagnini (Naples) read all or part of the manuscript and kindly shared their criticisms, always relevant and often extensive: I thank them from the bottom of my heart.

I have amassed a special debt to Heleen Sancisi-Weerdenburg, beginning with our first meeting in Groningen in 1983. Even when all the French publishers I had contacted exhibited great timidity, she offered to publish my book in the series she had founded and which she directs with Amélie Kuhrt. When Fayard and its editorial director Denis Maraval expressed a desire to publish the manuscript, which was then in the course of word-processing in Utrecht, under the care of Mme L. Van Rosmalen, Heleen Sancisi-Weerdenburg and the directors of the Netherlands Institute for the Near East (Leiden) accepted this proposal with great grace, for which I am especially grateful to them.

Prologue

The Persians before the Empire

1. Why Cyrus?

Discontinuous Documentation and the Longue Durée

The violent collapse of the mighty Assyrian Empire after the fall of Nineveh in 612 to a coalition of the Medes and Babylonians has sometimes been called a “scandal of history.” The sudden appearance of the Persians in Near Eastern history and the lightning campaigns of Cyrus II, the Great, pose questions for the historian that are urgent both in their breadth and in their complexity. In two decades (550–530), the Persian armies led by Cyrus II conquered the Median, Lydian, and Neo-Babylonian kingdoms in succession and prepared the ground for Persian domination of the Iranian Plateau and Central Asia. How can we explain this sudden outburst into history by a people and a state hitherto practically unknown? How can we explain not only that this people could forge military forces sufficient to achieve conquests as impressive as they were rapid but also that, as early as the reign of Cyrus, it had available the technological and intellectual equipment that made the planning and building of Pasargadae possible?

The historian who works on the *longue durée* is well aware that an illustrious reign and a decisive event are consistent only with a history whose roots delve deep into a fruitful past. The Hellenistic historian Polybius was fully aware of this when he explained to his readers in the introduction to his *History* the need to reach far back in time, to understand how “the Roman state was able without precedent to extend its dominion over nearly all the inhabited world, and that in less than fifty-three years”; and he continued, “In this manner, when we come to the heart of my subject, we will have no trouble understanding how the Romans made their plans, what the military means and the material resources available to them were when they engaged in this enterprise that permitted them to impose their law on sea as well as on land and in all our regions.”

The same goes for the beginnings of Persian history: it is agreed that the victories of Cyrus could not be conceived without the prior existence of a structured state, an organized and trained army, a well-established royal authority, and numerous contacts with the Mesopotamian and Aegean kingdoms. Such great victories cannot be explained simply by a one-sided insistence on the decadence of the states conquered by Cyrus—a “decadence” whose rhythms and modalities it is convenient to avoid specifying. Nor can it be explained by recourse to the convenient but reductive supposition of the intrinsic superiority of nomads over settled peoples. In short, every historical reflection leads us to suggest that the accession of Cyrus II was not only the point of departure for the first territorial empire that brought political unification to the immense area from the Aegean to the Indus; it was at the same time the outcome of a long process for which we have only fragmentary, elliptical, and discontinuous information.

Persian History and Greek Representations

Persian history, indeed, was never treated in antiquity by a historian of the stature of a Polybius. The “theoretical model” of the Greek authors of histories of Persia is desperately schematic and poor. Generally speaking, they are content to emphasize that the Persian Empire was nothing but the continuation of the Median kingdom conquered by Cyrus in 550. Take the case of Strabo. He is not satisfied to note that Ecbatana retained its prestige after the victory of Cyrus (XI.13.5). With the aid of the most dubious arguments from climate, he states that the Persians borrowed from the Medes

their “Persian” stole, as it is now called, and their zeal for archery and horsemanship, and the court they pay to their kings, and their ornaments, and the divine reverence paid by subjects to kings. . . . The customs even of the conquered looked to the conquerors so august and appropriate to royal pomp that they submitted to wear feminine robes instead of going naked or lightly clad, and to cover their bodies all over with clothes. (XI.13.9♦)

He also refers to the opinion of other authors: “Some say that Medeia introduced this kind of dress when she, along with Jason, held dominion in this region” (XI.13.10♦): how history and mythology are intertwined here! Still later (XI.13.11♦), he notes that Median customs are identical to Persian customs “because of the conquest of the Persians,” and he concludes: “I shall discuss them in my account of the latter.” But there (XV.3.20), he merely notes that Persian customs are identical to those of the Medes and other peoples.

It must always be stressed that, aside from the obvious chronological imprecision of Strabo’s arguments, they are built on a series of cultural stereotypes such as can be found in many other Greek authors who claim cavalierly to recount the history of the Persian people: the Persian conquest brought Median wealth and luxury to the conquerors, symbolized especially by garments that in themselves demonstrated the “feminization” of the *nouveaux riches*. Similarly, it was from the Medes that Cyrus’s Persians copied their court ceremonial altogether. The Persian conquest is fully explained by “the allure of riches.” This is also the underpinning of Plato’s version in the *Laws* (694c–695a): “Persian decadence,” beginning with Cambyses, is explained by the fact that “Cyrus’s own sons received a Median-style education, an education corrupted by so-called ease, in the hands of educators who were women and eunuchs”! Herodotus (I.126) reverts to the same sort of interpretation to explain to his readers why the Persians enlisted in great numbers under the banner of Cyrus: poverty-stricken, the Persians were consumed by the desire to lay their hands on Median riches.

In keeping with the perverse logic of this “theoretical” model, the evolution of a society could not be explained in any way other than by external stimuli and challenges. Therefore, the victors (the Persians) could only be characterized as a less developed people, with everything to learn from the peoples they were to conquer; they had no alternative but to assume the customs and institutions found among the earlier powers. In short, the Persians before Cyrus have no history. In other words, the authors regularly assume a priori the problem that excites and divides modern-day historians; or, more precisely, neither Herodotus nor Xenophon nor Strabo has the slightest idea that their presentation raises such a problem.

2. The Founder Legends

On the period before Cyrus, then, the Classical sources are virtually worthless, at least to those who would reconstruct the main stages in the formation of the Persian

kingdom. In addition to recitation of military expeditions, Herodotus devotes a long passage (I.107–130) to the origins of the Persian people, in the context of his report of Cyrus's victory over the Median king Astyages. He himself justifies his long excursus with these concluding words: "That, then, is the story of the birth and upbringing of Cyrus, and of how he seized the throne" (I.130⇨).

Cyrus (II) is presented there as born to the Persian Cambyses, son of Cyrus I, and Princess Mandane, daughter of the Median king Astyages. Disturbed by omens that portended an uncommon destiny for the child to be born to his daughter, Astyages had wanted to choose as son-in-law "a man of good lineage and character, but one whom he judged to be below a Mede even of middling character." Another dream and the *magi's* interpretation of it convinced him that the child who was about to be born "would become king in his place." Even though he was "aged and without male offspring," the king then decided to dispose of his grandson. He charged Harpagus, "a relative of his, the Mede who was most devoted to him, to whom he had entrusted all his affairs," with this task. Because Harpagus was somewhat anxious about appearing to be the murderer in the end, he passed the task on to Mithradates, one of the royal shepherds, "who, as he knew, would graze his herds in pastures that were most convenient for his plan and in mountains that teemed with wild animals." Mithradates, in turn, decided not to expose the baby to the wild animals at all, but instead to raise him as his own, taking into account that his wife, who had just given birth to a stillborn child, was still grieving. To fool the royal constabulary, "he took his stillborn child, placed it in the basket in which he had brought the other, adorned it with all the trappings of the other, brought it to the most deserted mountain, and set it there." The ruse worked. From that moment, "he who would later be called Cyrus was raised by the wife of the shepherd who had adopted him."

Then Herodotus tells how at the age of ten Cyrus enjoyed great prestige in the eyes of his playmates, who chose him to play the king in their games. Cyrus played his role so well that he severely punished "the son of Artembares, a respected man of the Median community." Mithradates and Cyrus were denounced by Artembares' father and called before Astyages, who soon realized that Mithradates' son was none other than his own grandson. He punished Harpagus cruelly by serving him the flesh of his own son mixed with mutton at a banquet. Then, reassured by the *magi*, Astyages sent Cyrus to Persia, where he rejoined his family. Herodotus then tells how when Cyrus grew to manhood he was able to depose Astyages, with the aid of Harpagus, and give power to the Persians (I.123–130).

Herodotus (I.95⇨) claims to have this story from Persian informants, "from those who seem to tell the simple truth about him without trying to exaggerate his exploits." He adds that he knows three other versions of the origins of Cyrus. In one, reported by Justin (I.4.10), the suckling child, abandoned in the forest by the shepherd, survived thanks "to a female dog who gave suck to the child and protected him from the wild beasts and the birds of prey." A third version, preserved by Nicolaus of Damascus, who doubtless got it from Ctesias, has as Cyrus's father Atradatae, a Mardian, a member of one of the most abject tribes of the Persian people. Cyrus's father practiced banditry and his mother, Argoste, raised goats. According to "the Median custom," the young Cyrus was "given" to a rich and exalted personage, Artembares, to take care of. This Artembares held the enviable position of royal cupbearer in the court of Astyages. Weakened by age and infirmity, Artembares, with the consent of the king, passed his title to Cyrus, whom he had

adopted. Cyrus summoned his parents to court. Having become still more powerful, he made Atradates "the satrap of the Persians" and his mother the richest woman in Persia. Then came the revolt. . . .

What facts can the historian extract from these stories? The identity of certain folkloric themes with themes in the legend of Sargon King of Akkad, as it may be reconstructed from the tablets, shows that the various versions are constructed on a very ancient Near Eastern framework, filled out both by the inspiration of popular storytellers and by the goals of political propaganda (cf. Diodorus II.4.3). There is scarcely any doubt that the legend incorporates typical Iranian features as well. All these tales are intended primarily to exalt the memory of a charismatic founder, marked from his birth by signs of uncommon destiny. For this reason, it was piously passed on to young Persians from generation to generation. Each of the various versions places the origins of Cyrus in the context of relations between the powerful Medes and their Persian vassals. They are all equally at home within the story of the overthrow of Median power by the Persians. But, of course, in turning Cyrus into the creator of the Persian kingdom that was to rise up against Ecbatana, the various versions of the founder legends become useless for discussing Persia before Cyrus.

3. *The Kings of Anšan*

The Persians, however, left no literary record of their own history. The only form of official historiography in this period is the genealogies recorded by the kings themselves. In his famous inscription carved into the cliff at Behistun, Darius provides details of his Achaemenid background:

I am Darius the Great King, King of Kings, King in Persia, King of countries, son of Hystaspes, grandson of Arsames, an Achaemenian. Saith Darius the king: my father was Hystaspes; Hystaspes' father was Arsames; Arsames' father was Ariaramnes; Ariaramnes' father was Teispes; Teispes' father was Achaemenes. Saith Darius the King: For this reason we are called Achaemenians. From long ago we have been noble. From long ago our family had been kings. Saith Darius the king: VIII of our family (there are) who were kings afore; I am the ninth; IX in succession we have been kings. (DB I §§1-4♦)

A genealogy of this sort thus allows us in principle to reach far back in time, to the very beginnings of Achaemenid history, when Persia was still in Persis. We might add that Herodotus (VII.11) offers a royal genealogy that does not correspond exactly with that given by Darius, since the succession is thus presented by Xerxes: Achaemenes—Teispes—Cambyses—Cyrus—Teispes—Ariaramnes—Arsames—Hystaspes—Darius.

We have two other inscriptions in the names of Ariaramnes and Arsames, whom Darius gives as his great-grandfather and grandfather respectively. They contain the following text: "Ariaramnes [Arsames], the Great King, King of Kings, King in Persia . . . this country Persia which I hold, which is possessed of good horses, of good men, upon me the Great God Ahura-Mazda bestowed (it). . ." (*AmH*; *AsH*). But these documents are something less than certain. For one thing, there are serious doubts about their authenticity. For another, the assertions of Darius are themselves highly suspect—not, of course, that their authenticity may be doubted for a moment, but simply because the primary intention of the text is to justify all of Darius's actions after the death of Cambyses and to establish what he asserts as his family's rights—a rather dubious claim, as we shall see. A past revised and corrected by Darius hardly allows historians to sharpen their knowledge of the epoch of the early kings.

To do this, it is much better to rely on a Babylonian text, the *Cyrus Cylinder*, which gives the oldest genealogy. Cyrus is there called the “king of Anšan,” and the family line is presented as follows: “Son of Cambyses, Great King, king of Anšan, great-grandson (or “descendant”) of Teispes, Great King, king of Anšan, from a family [that has] always [exercised] kingship.” The dynastic succession is thus established in the form Teispes–Cyrus I–Cambyses I–Cyrus II. As for the domain of the kings, it consisted of Anšan, as shown by a seal engraved with the legend “Kuraš of Anšan, son of Teispes” (PFS *93), a person usually identified with Cyrus I (fig. 7). The country is now identified with certainty: it is the plain of Marv Dasht, in Fārs. It is thus in this region—which would later take the name Persis—that the first Persian kingdom was established.

4. Anšan and Susa

The country the Persians conquered and peopled was in no way a political backwater. As early as the beginning of the second millennium, the Elamite kings bore the title “king of Anšan and Susa.” The Elamite kingdom thus occupied both the plain (Susa) and the High Country (Anšan). At the site of Anšan itself (Tall-i Malyan), Elamite tablets dated to the end of the second millennium have been discovered. These texts attest to the existence of an Elamite administration in the region, and considerable building activity (temples, palace) testifies to the authority of the “kings of Anšan and Susa” in the southern Zagros during the second millennium.

But after this time, the Elamite kingdom, in the chronological phase called Neo-Elamite II (ca. 750–653), weakened considerably. The dynasty was ravaged by continual internecine struggles. It is possible that several “kings” coexisted from the beginning of the seventh century on. At this date, the center of gravity of the kingdom was no longer in the highlands, but on the plain, where the texts reveal three “royal towns”: Susa, Madaktu (a stronghold situated on the Duwairij River), and Hidalu (in the first foothills of the Zagros). In 691, the Elamite and Babylonian armies waged a brutal war against the Assyrian forces, with both sides claiming victory.

It seems that the dependence of Anšan on Susa became increasingly remote and merely formal, with the Neo-Elamite kings unable to assert their authority there in any concrete way. In particular, they had to do battle many times with the Neo-Assyrian kings, who mounted frequent expeditions against Elam, forcing the king to “flee to the mountain.” The Elamites, for their part, attempted several times to support Babylonian revolts against Assyria, without much success. The battle of Halule (691) was nothing more than a respite. In 646, Aššurbanipal launched a broad, victorious offensive, which resulted in the capture and sack of Susa and the (temporary) disappearance of the Elamite kingdom. It is perhaps in this context that Teispes, Cyrus II’s great-grandfather, arrogated to himself the title “king of Anšan,” thus proclaiming himself successor to the Elamite kings in the highland that was to take the name *Persis*.

The problem of absolute chronology is more difficult. An inscription of the Assyrian king Aššurbanipal (669–ca. 630) mentions the submission of Kuraš, king of Parsumaš, who shortly after 646 sent tribute to Nineveh and sent his oldest son, Arukku, as a hostage. It has long been held that this Kuraš was none other than Cyrus I himself, king of Persia (Parsumaš). But this interpretation is now being questioned. The proposed equivalence between Parsumaš and Persia is uncertain, and Parsumaš is probably distinct from Anšan (though this point is still under discussion). Since the chronology of Cyrus

It is securely established (559–530), it would be necessary under this hypothesis to lower the chronology of the first Persian kings, whose approximate dates would otherwise be: Teispes (ca. 635–610), Cyrus I (ca. 610–585), Cambyses I (ca. 585–559). Moreover, the settlement of this Iranian population in the region of Anšan was certainly much earlier. It is generally agreed that, having come from the northern Zagros, rather than directly from the Iranian Plateau, the Iranians moved gradually into Anšan toward the end of the second millennium.

5. Persian Society before the Conquests: Herodotus and Archaeology

Herodotus and Persian Society

We know nothing, or nearly nothing, of the kingdom of Anšan before the offensive launched by Cyrus II against the Medes in the late 550s. In the account he gives of the revolt of Cyrus against the Medes, Herodotus reports that the young king assembled his people, and he describes their organization in the following terms:

The Persian nation contains a number of tribes (*genea*), and the ones which Cyrus assembled and persuaded to revolt were the Pasargadae, Maraphii, and Maspii, upon which all the other tribes are dependent. Of these the Pasargadae are the most distinguished (*aristoi*); they contain the clan (*phrētrē*) of the Achaemenidae from which spring the Perseid kings. Other tribes are the Panthialaei, Derusiaei, Germanii, all of which are attached to the soil (*arotēres*), the remainder—Dai, Mardi, Dropici, Sagartii—being nomadic. (I, 125♦)

Persian society as understood by Herodotus was thus a tribal society. Herodotus obviously used Greek terms to designate the groupings and subgroupings. But the social division that can be recognized there is comparable to what is also known from Iranian terminology. The basic level of organization is the patrilineal family (Old Persian *māna*); a group of families constitutes a clan (Old Persian *viθ*); the clans are grouped into a tribe (Old Iranian **zantu*). The tribe is simultaneously a genealogical reality and a spatial reality: Maraphii and Pasargadae are both ethnonyms and toponyms. Each tribe and clan had a territory of its own, the former being led by a tribal chieftain (**zantupati*). This was a situation that was to obtain until the very end of the Achaemenid period, as seen from the example of Orxines, described in this way by Quintus Curtius at the time of Alexander:

From there they came to Pasargadae; that is a Persian race (*gens*), whose satrap [= tribal chieftain] was Orsines, prominent among all the barbarians for high birth and wealth. He traced his descent from Cyrus, formerly king of the Persians; he had wealth, both what he had inherited from his forefathers and what he himself had amassed during long possession of sovereignty. (X.1.22–23♦)

Among the tribes, Herodotus makes a major distinction between farmers and nomads. This opposition is found in every Classical author who deals with “barbarian” peoples. It is based on a assumption that treats nomads, often likened to robbers, as backward populations in the same way that, for the Greeks in particular, farmers represent a superior level of civilization. We have seen, for example, how for Ctesias the father of Cyrus was a Mardian who practiced banditry while his mother raised goats. Throughout history, the Mardians kept the reputation of being a fierce population, warlike and aggressive. As for the Sagartians, Herodotus portrays them elsewhere as “a nomadic tribe . . . a people who speak Persian and dress in a manner half Persian” but who, although they were incorporated with the Persians into the army of Xerxes, retained weapons—lassos—and styles of combat all their own (VII.85♦).

The distinction between nomads and farmers correlates with another distinction, a political distinction. Herodotus assigns special prestige to the Pasargadae, the Maraphii, and the Maspai, "to whom all the other Persians are subject." The term used by Herodotus implies a relationship of subordination, linked to the antiquity of certain tribes. Within the dominant group, the Pasargadae are considered "the noblest." One gets the sense that intense struggles took place between tribal chieftains. Herodotus specifies that Cyrus convened "an assembly (*aliē*) of the Persians," which seems to indicate that in order to declare war on the Medes the king had to take the advice of the tribal chieftains, especially of the chiefs of the Maraphii and the Maspai. On the basis of this mention, one is tempted to suggest that in the army each chieftain retained the command of his own contingent, under the supreme authority of the king, who was the chief (Greek *karanos*) of the 'people in arms' (Old Persian *kāra*). All the evidence agrees, in any case, that one of the Achaemenid king's ideological justifications was his aptitude for war and for leading armies. However, the conditions that brought three tribes to preeminence, or how the Pasargadae themselves became *aristoi*, or, for that matter, how and when the Achaemenid clan within the Pasargadae arrogated to itself the royal power are impossible to determine. All we can do is observe that Herodotus wrote toward the middle of the fifth century, at a time when the antiquity of the rights of the Achaemenids had become the official version. But we will see that this quite doubtful version owes much to Darius I. In other words, there is nothing to prove that the Achaemenids (in the clan sense) had held any special place of any antiquity in Persian society.

Limits on the Use of Classical Sources

In a more general way, some limits should be set on the use of the information provided by Herodotus and other Classical authors. Reading uncritically, we are tempted to conclude that Cyrus's conquests can be compared to raids by "nomads" in search of booty from the settled kingdoms. This is clearly not so. Cyrus would soon show that his objectives were much more ambitious: he intended not to raid but to conquer permanently. This observation implies that Cyrus's army was something more than an ad hoc assembly of tribal contingents fighting in loose order, each retaining its own style of combat. Rather, we must assume that before starting a war the Persian king had an army that had no want of arms or training in comparison with those against which he launched his offensive. It is also likely that when he led his army against the Medes Cyrus was much more than the most important of the tribal chieftains, a *primus inter pares*. It is much more likely that, ever since his predecessors had assumed the royal title, they were able to exert their power. This is indicated by the regularity in dynastic succession, at least as it is reported by Cyrus himself in his Babylonian proclamation of 539.

It is true that Xenophon attributed vast military reforms to the Cyrus he described: modification of the Persian armament (breastplate, wicker shield, swords, and battle-axes rather than simple spears and bows; *Cyropaedia* II.1.9–10; 16–17), organization of the command on the decimal system (II, II.1.22–24), and establishment of a cavalry (IV.3.4–23; VI.4.1) and a chariotry (VI.1.27–30; 50–54). But, here as elsewhere, Xenophon's reports must be read with caution. However different the inspiration of Herodotus and Xenophon, both agree in making Cyrus the creator ex nihilo of a Persian state. Despite what Xenophon claims (I.3.3), it is particularly difficult to accept that before contact with the Medes the Persians did not raise or ride horses. Whatever the established reputation

of Median horsebreeding and cavalry, the victories achieved by Cyrus imply that at that date he already had a powerful cavalry. How can it be denied that the army raised by Cyrus against Astyages was made up of troops perfectly capable of taking on the Median army? After all, does not the seal of Kuraš of Anšan show a mounted warrior trampling his enemies beneath the feet of his steed (fig. 7)? The victories of Cyrus over the Medes of Astyages do not represent chance or luck. They cannot be explained solely in terms of the treason of those close to Astyages, on which Herodotus places such emphasis.

The Findings of Archaeology

It is also true that recent archaeological work appears to be consistent with Herodotus. As a result of surveys of the Marv Dasht, the plain of Persepolis, it has been possible to determine that the number of occupation sites decreased drastically from the end of the second millennium on (or before), and that it was not until the reigns of Cyrus and Cambyses that important permanent sites reappear, at Pasargadae and on the plain of Persepolis. From these observations we can infer generally that the loss of sedentary settlements in the region must be directly related to an internal development of the Elamite populations in the second half of the second millennium and to the arrival of Iranian populations at the beginning of the first millennium, from which those whom we call the Persians would eventually arise. During the first half of the first millennium, the country would thus have been populated essentially by nomadic tribes who, by definition, leave no archaeological traces.

Nonetheless, this reconstruction is still problematic. First of all, if the Persians devoted most of their time to activities related to nomadism and stockbreeding, it is difficult to understand why the names of their months show the existence of a calendar organized primarily around agricultural activities. Furthermore, the agreement between archaeology and Herodotus is more apparent than real. Herodotus was writing in the fifth century, on the basis of unidentifiable sources. As has already been stressed, there is no reason to suppose that his information applies specifically or exclusively to central Fārs in the first half of the first millennium. Yet again, his analysis of Persian society remains very general and atemporal. One reason is doubtless that the Persian society of his time was still organized by clans and tribes (cf. IV.167). It also allows us to surmise that even in his time Persian tribes practiced nomadism (whatever the changing and varied reality hidden beneath that term). Archaeology seems to confirm this, when we consider that at the time of Darius and Xerxes, the number of urban sites remained very low.

As for archaeological results per se, let us first note that they come from explorations conducted in a single region of Fārs; this is certainly a central region, since it is there that the first Persian kingdom was established. But where and how the ancestors of the Persians lived in the first centuries of the first millennium remains totally unknown. Moreover, the reconstruction leaves an essential problem completely in shadow. From the time of their arrival in Fārs, the Persians lived in permanent contact, even symbiosis, with the Elamite population. The fruitfulness of the Elamite heritage in Achaemenid civilization known from Cyrus onward in itself attests to the breadth and depth of the acculturation processes at work between the two groups. This Elamite influence can already be seen in the seal attributed to Cyrus I: stylistically, it belongs to a Neo-Elamite type. When we consider further that this seal was still used in Persepolis through the closing years of the sixth century (503–501), it speaks volumes for the permanence and fruitfulness of Elamite influence. There is even an obvious relationship between the

Susa tablets and the Persepolis tablets. So it must be admitted that the break was not total and that the picture of discontinuity gleaned from the archaeology of central Fārs provides only a partial explanation.

Perhaps the error lies in suggesting that all of the ancestors of Cyrus lived like nomads in the Marv Dasht. The archaeological picture obtained from several sectors of eastern Khūzestān, in the lowland, is quite different. There, in fact, a remarkably continuity of urban settlement can be observed. A built tomb, discovered at Arjan, some 10 km from Behbahan (probably Hidalu), allows us to recognize that very elaborate processes of acculturation had been at work in Elamite, Iranian, and Assyro-Babylonian traditions. Neo-Elamite tablets attest to the presence of Iranians at Hidalu in the course of the seventh century. Some of these tablets are part of a group called the Acropolis Tablets, which represents part of the administrative archives of the palace of Susa in the period now called Neo-Elamite III B (approximately the first half of the sixth century; but the dating is uncertain). In general, these texts refer to deliveries to the palace of a very wide array of products: wool, textiles, different colored clothing, wood, furniture, tools, weapons, and so on. One-tenth of the personal names can be identified as Iranian; nine-tenths are Elamite. Among the craftsmen are men with Iranian names, sometimes labeled "Persian." One of the clothing suppliers is a certain Kurluš, who has a son with the Persian name Parsirra. One of the Masters of the palace (*rab ekalli*) is called Harina (Iranian Aryaina); someone of the same name is designated son of Mardunuš (Mardonius), etc. The tablets also show that Iranian terms were introduced into the technical vocabulary in the areas of textiles and of weapons. One garment is called *sarpi*, a word in which we recognize Greek *sarapis*, which ancient grammarians (Pollux, Hesychius citing Ctesias) list sometimes as Median, sometimes as Persian; some arms (quivers, spears) have Persian names.

Overall, this evidence lets the historian flesh out the succinct analysis of Herodotus and refine the archaeological picture obtained from explorations in central Fārs. Repeating an observation of R. Ghirshmann: "The idea that was advanced long ago and that views [Persians] as nomads moving about with their herds in search of pasture must be reconsidered." In any case, through contact with the Elamites, in particular in Khūzistān, the Persians acquired technology and know-how, observable most especially in metalwork, that complemented the Iranian traditions. Elsewhere, Persians assumed important posts at the courts of the last Elamite rulers, some of them being provided with 'domains' (*irmatam*) in several regions of the lowlands and the plateau. If it is added that the presence of Iranians and Persians can be detected in Babylon from the beginning of the sixth century, it will be correct to conclude that the kingdom of Cyrus did not constitute a peripheral, isolated region, mired in an "archaic" way of life. On the contrary, if the Persians under Cyrus were able to assume hegemony, it is because they were well able to reap the fruit of the close and prolonged contacts they had struck up in different forms with the Elamites, the Medes, and the Babylonians.

6. Anšan, Ecbatana, Babylon, and Susa

The Consequences of the Fall of the Assyrian Empire

Fortunately, the absence of written sources bearing on Anšan is counterbalanced, so to speak, by Babylonian chronicles that allow us to reconstruct the international context within which the first Persian kingdom rose to power. The fall of the Assyrian Empire is

plainly the crucial event in that context, an event from which the victors, the Median and Neo-Babylonian kingdoms, were able to profit. Assyrian power was at its height during the reign of Aššurbanipal (669–ca. 630) but fell into decline after his death. Military defeats came on top of problems of dynastic succession. In 626, Nabopolassar was recognized in Babylon; this was the beginning of the Neo-Babylonian kingdom, which was to last until the conquest of Cyrus in 539. To the north and east, the Medes launched offensives against Assyrian territory, seizing the province of Arrapha in 615. In 614, the Median king Cyaxares took Aššur, which he sacked. This feat was followed by an alliance between the Medes and the Babylonians. Two years later (612), the allied Median and Babylonian armies took Nineveh. Assyria's attempts at resistance soon failed (612–610), despite the attack on the Babylonian positions led by Pharaoh Necho. The Assyrian Empire had perished in the storm. When the survivors of the Ten Thousand traversed the region two centuries later, Xenophon described the Assyrian capitals Kalah and Nineveh (under the names Larissa and Mespila), which he saw as abandoned cities where nothing survived but miserable remnants (*Anab.* III.4.6–12).

We do not know for sure how the two conquerors divided the spoils of the Assyrian Empire. While the Babylonians retained control of the strategic site of Haran, there is no doubt that the Medes not only seized much Assyrian territory but also carried on their conquests in other directions. In 585, King Astyages, successor of Cyaxares, signed a treaty with the Lydian King Alyattes. According to Herodotus (I.74), the treaty was brought about through the mediation of the Cilician and Neo-Babylonian kings. Astyages and Alyattes undertook to respect a border on the Halys River. The treaty was sealed with dynastic marriages that made Alyattes the brother-in-law of Astyages. It is perhaps also from this time that Median dominion over several Central Asian peoples dates—distant dominion to be sure, having more to do with alliances with local chieftains than with setting up imperial structures.

The Assyrian rout left two great powers face to face: the Medes and the Neo-Babylonian kingdom. During the reigns of Nebuchadnezzar II (604–562) and his successors, the Neo-Babylonian kingdom regained the Assyrian legacy in Syria–Palestine and annexed part of Cilicia. The campaigns against Egypt, however, met with defeat. Another region escaped Neo-Babylonian dominion, in part at least: Elam, which had disappeared from the scene after being defeated by Aššurbanipal. It seems clear that the destruction of Susa (646) was not as complete as the Assyrian annals would have us believe. A series of converging indications shows rather that, toward 625 at the latest, an Elamite kingdom was rebuilt around Susa, even if Babylon maintained its grasp on one or several Elamite principalities. This Neo-Elamite kingdom extended east to the foothills of the Zagros, which thus constituted a frontier zone between the Elamite kings of Susa and their old possession, Anšan, thereafter in the hands of Cyrus. There is no indication that this Elamite kingdom of Susa was required to recognize Median hegemony at the beginning of the sixth century.

The fact remains that the international situation prevailing at the beginning of the reign of Cyrus (around 559) was quite different from the context in which the first “king of Anšan” arose, about a century earlier. In 559, the Near East was divided into several competing kingdoms: Media (Ecbatana/Astyages), Lydia (Sardis/Croesus), Babylonia (Babylon/Nabonidus), Elam (Susa/Ummanniš?), and Egypt (Saïs/Amasis). Two powers faced off: (1) the Neo-Babylonian kingdom, which continued to amass conquests in the

west to the point of dominating the entire Fertile Crescent beginning with Nebuchadnezzar's victory at Carchemish on the Euphrates in 605 until, a few years after the accession of Cyrus (559), Nabonidus took supreme power in Babylon (556); and (2) the Median kingdom, which imposed its dominion to the west as far as the Halys under the direction of Astyages (king since 585–584) and seems to have succeeded in extending its influence over several local princes of the Iranian Plateau, apparently as far as Bactria.

Anšan on the World Stage

On the other hand, we know nothing of the kings of Anšan during this long period or of the consequences the military operations might have had for them. Were the kings of Anšan able to participate more directly in international relations thereafter? It would be most interesting to be able to consider this to the point of being able to assess the importance achieved by the kingdom governed by the grandfather, then the father of Cyrus II. It must be admitted that it is impossible to know, given that before 553 not one Babylonian source alludes explicitly to the leaders of Anšan.

We must show great caution in confronting the Classical texts dealing with the fall of the Assyrian Empire. According to Ctesias (used by Diodorus, II.23–28), the “moral decadence” displayed by Sardanapalus (Aššurbanipal) was what drove the Mede Arbaces to raise the banner of revolt and to organize a four-power coalition within which figured, alongside the Medes and Babylonians (under the command of Belesys), not only the king of the Arabs (Upper Mesopotamian populations), but also the Persians, “whom he summoned to liberty.” Aside from the fact that an Arbaces is otherwise unknown, we must underscore the surprising nature of the declaration made by the ruler of Ecbatana, who all the sources agree held sway over the Persians. Here, in contrast, the Persians, on an equal footing with the Medes, the Babylonians, and the Arabs (of Mesopotamia), are subject to the unbearable yoke of the Assyrians! The same sources were probably responsible for the report of a Hellenistic author, Amyntas (cited by Athenaeus XII.529e–f), according to which the walls of Nineveh (attributed to Sardanapalus) were demolished by Cyrus during the siege. These tales of the Assyrian defeat point to a vision that is Medo-centric (the leading role of Arbaces) and Perso-centric (the role of the Persians and Cyrus), in the face of which the historian is forced to express strong reservations on principle. It is not out of the question, on the other hand, to imagine that at the request of the Medes, the Persians were able to send a contingent to the Medo-Babylonian army that then united against the Assyrian armies.

Median Dominion

Beyond this observation, we must return once more to the matter of Persian subjection to the Medes. According to Herodotus's story of Cyrus's revolt, “The Persians had long resented their subjection to the Medes” (I.127♦). Nonetheless, we must admit that we know neither the origins nor the precise nature of the subjugation of the Persians by the Medes. Herodotus attributes the conquest of the Persians by the Medes to King Phraortes: “He carried his military operations further afield, and the first country he attacked and brought into subjection was Persia. By the combination of these two powerful peoples he proceeded to the systematic conquest of Asia, and finally attacked the Assyrians” (I.102♦). Owing to the annalistic framework of Herodotus's Median episodes, we can date the reign of Phraortes to 647/646–625/624. If we adopt the dynastic chronology proposed for Persia, this official subjugation must be located in the reign of Teispes

(ca. 635–610?). However it may have happened, the event must be situated in a much broader wave of conquest, which undoubtedly allowed Phraortes and his successors to seize many other principdoms that held the Zagros range. But we are simply unable to analyze further a situation whose exact nature is inaccessible to us, apart from proposing some plausible but vague hypotheses to explain why the Persians, like other peoples subject to the Medes, were required to send tribute and troops to Ecbatana.

Dynastic Marriages?

In other respects, the ancient authors liked to stress the continuity between the two kingdoms, Media and Persia. Herodotus (I.107), Justin (I.4.4), and Xenophon (I.2.1) make Cyrus the son of Cambyses (I) and Mandane. They portray Mandane as the daughter of Astyages and the Lydian princess Aryenis, daughter of Alyattes and thus sister (or half-sister) of Croesus. In this scenario, Cyrus was a second-generation offspring of the diplomatic marriage concluded in 585 between Media and Lydia, under the auspices of the *syennesis* of Cilicia and the Neo-Babylonian king. Indeed, interdynastic marriages were common in the ancient Near East until the Hellenistic era. In a way, this justifies the relevance of Herodotus's remark about the Medo-Lydian marriage in 585: "knowing that treaties seldom remain intact without powerful sanctions" (I.74♦). But it must be agreed that any information in the Classical authors is suspect. Moreover, they do not agree among themselves on the tradition of the Persian-Median marriages. Ctesias (§2) even asserts straightforwardly, "Cyrus did not have the slightest degree of kinship with Astyages." According to him, Amytis was married in 550 to the Mede Spitamas, and she was later wed to Cyrus after the execution of her husband. Berossus (FGrH 680 F7d) states that, after the fall of the Assyrian Empire, Astyages married his daughter Amytis to Nebuchadnezzar, son of Nabopolassar—all assertions that are virtually incomprehensible in view of both chronology and history. The evidentiary confusion is such that doubts exist as to the reality of the Median marriage of Cambyses, father of Cyrus, inasmuch as it could offer a convenient ideological justification for the power of Cyrus in Media and even in Lydia. This is a motif found elsewhere in Herodotus, used to explain the first contacts between Cyrus and Amasis of Egypt and then the conquests led by Cambyses (III.1–3). It seems clear that in most cases it is actually a dynastic justification invented *post eventum*.

7. From the Medes to the Persians

Borrowing and Inheritance

On the basis of the Greek reports, at least in part (it is generally thought, though with less and less agreement), that Median influence was decisive in the creation and organization of the Persian kingdom. The examination of Achaemenid administrative and palace vocabulary has led some historians to conclude that Median loanwords were particularly frequent in the areas of royal titulature and bureaucracy. This interpretation is based on a belief in the existence of a Median language different from Old Persian. At the same time, it is founded, explicitly or implicitly, on the hypothesis that the Persians themselves had no state tradition of their own and that the Median kingdom was the only available model, that the Medes also indirectly transmitted Assyro-Babylonian and Uartian traditions to the Persians in these areas. This interpretation is likewise based on the observation that, after the conquest of Ecbatana, the Greeks and the peoples of the

Near East frequently referred to the Persians under the name of Medes (thus, for example, the French term “Guerres Médiques” for what in English are the “Persian Wars,” or ancient Greek characterization of political collaboration with the Achaemenid Empire and its representatives as “Medizing”). It is inferred that Cyrus slipped into the mold of Median traditions, lock, stock, and barrel—all the more so in that Media already exercised powerful influence during the period of Ecbatana’s political supremacy.

This kind of explanation raises a series of historical problems, whose details we would do well to specify. The ethnocultural connection between the Medes and Persians is undeniable: both are Iranian peoples, springing from the same Indo-Iranian stock, albeit at considerable remove. But this observation is not in itself determinative. For this reason, the theory of linguistic borrowings remains quite disputable. It proceeds from an underlying hypothesis—the assumption that the dialect words found in the vocabulary of the Old Persian inscriptions come from a Median language. The problem is that we know virtually nothing of Median, for the plain and simple reason that we do not have a single inscription in that language. By reasoning that might be considered circular, Median has been reconstructed on the basis of Persian borrowings, themselves reconstructed. Given this fact, and not without solid arguments, the very existence of a Median language has itself been called into question. Some contend instead that the language of the Achaemenid inscriptions is a common language (*koinē*) used by the Medes as well as the Persians. According to this hypothesis, the theory of linguistic borrowings is considerably weakened, and it is not supported by the historical interpretations proposed by the Classical authors.

The Structure of the Median Kingdom

To be sure, the possible refutation of the theory that Old Persian borrowed political and ideological terms from a Median dialect used by a Median precursor state itself entails historical inferences of the greatest magnitude. In part at least, it is actually on the basis of these supposed borrowings that the picture of a strongly unified Median kingdom administered in the style of its Urartian and Assyro-Babylonian neighbors has been reconstructed. The interpretation is even more tempting when it seems at first sight to find agreement with the long discussion Herodotus gives in his *Mēdikos Logos* (I.95–106) of the origin and history of the Median kingdom. The essential role in this is attributed to Deioces, son of Phraortes (I), who, through a series of measures as brutal as they were effective, transformed a tribal society into a unified state dominated by an omnipotent king. The consolidation of royal power is illustrated and made concrete by the construction of a royal city, Ecbatana, a royal guard, and the creation of a very strict court protocol, in such a way that the heads of the great Median families whom he had stripped of their prerogatives “took him for a being of a different nature from themselves.” Moreover, to exercise his power, Deioces’ “spies were busy watching and listening in every corner of his dominions” (I.95–101♦). His successor, Phraortes (II), inherited such power that he was able to subjugate the Persians and begin the war against the Assyrians, but he perished in the war (I.102). After his death, his son Cyaxares continued the march of conquest. To this end, he reorganized his army in an effort to make the diverse contingents more unified. He marched against Nineveh, but he was thrown back by bands of Scythians. After a twenty-eight-year Scythian interregnum, he regained power: the Medes “recovered their former power and dominion. . . . They

captured Nineveh.” ♦ Shortly thereafter, his son Astyages succeeded him: this is exactly where the legend of the origins of Cyrus commences, into which the *Mēdikos Logos* is integrated.

But for many reasons Herodotus's Median tale is itself highly suspect. To be sure, the historicity of the kings depicted is hard to deny, and there is no compelling reason to doubt their chronology, but the story of the reforms imposed by Deioces resembles an existing model of the “founding father” too closely for us to place blind confidence in it. Furthermore, the institutions set up by Deioces (capital, personal guard, audience ritual, Eyes and Ears of the king) are strangely similar to the Achaemenid institutions frequently described by the Greek authors, so much so that we are tempted to think that Herodotus (just like Strabo later on; XI.13.9) applied (or could have applied) what he knew of the Persian court practices of his own day as a veneer over an entirely imaginary Media. The question remains: Was the Media of the time of Astyages really a powerfully integrated monarchic state, whose organization Cyrus could copy in Persia?

The Medes are also known from the Assyrian annals, to the extent that, beginning in the ninth century in particular, the Assyrian kings attempted to impose their control on the principalities of the Zagros. But the correspondences drawn from comparing Herodotus and the Assyrian sources remain hypothetical. It is clear, for example, that the identifications proposed between the personal names cited by Herodotus and those in the Assyrian annals cannot be taken on the probative value that is often attributed to them. Furthermore, at the time of the first confrontation (835), the Medes encountered by Šalmaneser III are described as a fragmented society, within which twenty-seven kings (*šarrāni*) exercised power independently of each other. There is no indication that the Median peoples underwent a rapid evolution toward the unification of the tribes around a supreme chief who might be called king of the Medes before the seventh century.

The results of archaeological explorations, however, must still be taken cautiously: no artifact can be called “Median” with absolute certainty, and the appropriateness of the term “Median art” has frequently been questioned. Three sites have been excavated within Median territory: Godin Tepe, Tepe Nūš-i Jān, and Bābā Jān. Fairly imposing residential structures have been uncovered there, some of which (hypostyle halls) are generally considered characteristic of Achaemenid architecture. But their precise dating continues to be questioned as does, consequently, the dating of the relationships that can be established between these constructions and the activities of the Median kings described by Herodotus.

Appraisal of the Discussion

The conclusion of the discussion is necessarily a bit disappointing but mirrors the corpus of evidence: historians cannot choose their sources. To a certain extent, in dealing with Median history, historians are faced with an evidentiary situation comparable with the situation that faces them in dealing with Persian history before Cyrus. In the absence of inscriptions and irrefutable archaeological records, they are led on the one hand to lengthy discussions of the credibility of Herodotus, while on the other hand, they must at the same time conform their reflections to a theoretical model of the evolution of tribal states. The difference is that the Medes appear frequently in the annals of Mesopotamian kingdoms, both Assyrian and Neo-Babylonian. But to which Medes do these texts refer? Must they necessarily be identified with the Medes of Deioces, Phraortes, Cyaxares, and Astyages? Nothing could be less certain.

All we can say is that the intervention of the Medes in international relations and their direct participation in the fall of the Assyrian Empire imply that the “Median kings” of the last third of the seventh century had succeeded in raising an army worthy of the name and thus that they possessed significant resources, amassed through tribute and through the profit on long-range trade with Central Asia—hence doubtless, for whatever reason, the interest in Herodotus’s mention of military reforms carried out by Cyaxares. It is still appropriate to assess the respective contributions of the Medes and the Babylonians to the fall of Assyria. To be sure—notwithstanding the claims of Ctesias and Amyntas—the participation of the Medes (and the Persians!) seems to have had a considerably smaller effect than did the Babylonian armies, and it seems doubtful that this impression is due to a later rewriting of history by Babylonian authors anxious to emphasize the decisive role of the Babylonian armies.

Despite the absence of irrefutable evidence, in the end we must stress the limits of an argument based on the ethnocultural links between the Persians and the Medes. In fact, after their joint arrival in the Zagros, Medes and Persians underwent varied and distinct evolutions. After arriving in Fārs, those whom we call Persians were particularly prone to Elamite influence, to the point that we now tend to think that the Persians of the time of Cyrus comprised a population descended from a blending of Iranians and Elamites. What is more, the permanence of Elamite borrowings in every aspect of social and political life leads us to believe that the organization of the kingdom of Cyrus and his successors owes more to the Elamite legacy, which can be identified precisely, than to Median borrowings, which are very difficult to isolate. Certain indications lead us to suppose that, far from being a “nomadic and primitive” state, the kingdom of Cyrus, based on the Elamite model, was forged with administrative devices that evoke and presage the organization seen fully in operation in Fārs at the time of Darius.

8. Conclusion

For now, the question raised at the beginning of this chapter (“Why Cyrus?”) has no satisfactory answer. All we can do is collect fragmentary and conflicting information and draw an impression from it that can be no more than probable. To be sure, examination of the stages of conquest undertaken by Cyrus will be able to shed some new light, but there is the risk of prophesying after the fact, in the manner of Diodorus Siculus:

Cyrus, the son of Cambyses and Mandane, the daughter of Astyages who was king of the Medes, was pre-eminent among the men of his time in bravery and sagacity and the other virtues; for his father had reared him after the manner of kings and had made him zealous to emulate the highest achievements. And it was clear that he would take hold of great affairs, since he revealed an excellence (*aretē*) beyond his years. (IX.22♦)

Now, without wishing to get ahead of the story, we must always keep in mind that we have no specific idea of the plans Cyrus might have made at his accession. We are equally uninformed about his reign up to the moment when he confronted Astyages, not quite ten years after taking power. Was he even in control of events? We cannot say for sure, since several documents imply or assert on the contrary that the initiative came from Astyages in the late 550s, and from Croesus some years later. Were his conquests preceded by a mature, preestablished, overall plan? or did the successive stages actually follow one another as consequences of initial success and of decisions of his opponents? This problem cannot be solved, as is fully recognized by those historians who, equipped

with more substantial tools for dealing with the evidence, are concerned with the origins and primary objectives of the conquests of Alexander or with the development of Roman imperialism.

PART ONE

The Empire-Builders:
From Cyrus to Darius

Chapter 1

The Land-Collectors:

Cyrus the Great and Cambyses (559–522)

1. Medo-Persian Hostilities, the Defeat of Astyages, and the Fall of Ecbatana (553–550)

Sources and Problems

Aside from the factual elements in the founder legends recorded by Herodotus and Ctesias (via Nicolaus of Damascus) and a few isolated passages in Diodorus and Justin, the only information we have about the Medo-Persian hostilities comes from Babylonian records of the reign of Nabonidus (556/5–539). The Neo-Babylonian king claims that during the first year of his reign Marduk gave him assurance in a dream that the Median threat in the region of Harran would soon be eliminated:

[And in truth], when the third year [553] arrived, Marduk raised up Cyrus, king of Anšan, his young servant (*ardu*); Cyrus scattered the great armies of Umman-Manda with his small army and he seized Astyages, king of the Medes, and he led him captive to his own country.

Another Babylonian text, the *Nabonidus Chronicle* (II.1–4), refers directly to Cyrus's victory. The paragraph preceding the entry for Nabonidus's year 7 (549) includes the following:

[Astyages] mobilized [his army] and he marched against Cyrus, king of Anšan, to conquer. . . . the army rebelled against Astyages and he was taken prisoner. [They handed him over] to Cyrus [. . .]. Cyrus marched toward Ecbatana, the royal city. Silver, gold, goods, property, [. . .] which he seized as booty [from] Ecbatana, he conveyed to Anšan. The goods [and] property of the army of [. . .].

These texts corroborate some points and clarify others in the material provided by the Classical authors. One of the questions that faces the historian is whether the operations Cyrus directed against Astyages were part of an overall strategy intended from the beginning to confront the Medes, the Lydians, and the Babylonians in succession and thus to create a unified empire of a kind new to the Near East. This is the impression the reader gets from the Classical texts dealing with the exploits of Cyrus. But as a general rule one must challenge interpretations that reduce History to matters of fate and exigency. And in this particular case, even though Herodotus presents the march on Ecbatana as the deliberate initiative of Cyrus alone, a Babylonian text, the *Nabonidus Chronicle*, says the contrary—that it was Astyages who launched the offensive.

What is more, within the “founder legend” that he presents in detail (I.95–130), Herodotus (I.108–29) dwells specifically on the treachery of a faction of the Median nobility toward Astyages. At the news of the approach of the Persian army raised by Cyrus, it is said, Astyages placed the Median army under the command of Harpagus—that is, the very person he had recently humiliated and severely punished for saving the infant

Cyrus from death. Harpagus quickly made contact with Cyrus, who was back in Persia with his father Cambyses (I); he even spurred him on in his revolt against the Medes. He also gathered around himself a group of Median nobles exasperated by the “severity” of Astyages: “Harpagus worked at persuading them to place Cyrus at their head and depose Astyages” (I.123♦). The prior understanding between Harpagus and Cyrus greatly favored Persian plans: “The Medes took to the field and engaged the Persian army; a few who were not in the plot did their duty, but of the remainder some deserted to the Persians and the greater number deliberately shirked fighting and took to their heels. The Median army collapsed disgracefully” (I.127–28♦). Thereupon, the Persians replaced the Medes as masters of Asia (I.130).

But by reducing the Medo-Persian war to a lucky battle and by presenting the conquest of Media as desired by the Medes themselves, Herodotus is obviously simplifying greatly. The Babylonian texts suggest that the decisive battle and the capture of Ecbatana were only the climax of open hostilities that had lasted at least three years (553–550). Indeed, the *Nabonidus Chronicle* confirms (II.2) that “the army rebelled against Astyages and he was taken prisoner.” But it also states, as we have seen, that it was Astyages himself who had taken the offensive (II.1), perhaps in order to put down a Persian rebellion that threatened his strategic positions and furthered the designs of his principal rival, the Neo-Babylonian king Nabonidus. On the other hand, it is not out of the question that Nabonidus, without necessarily going so far as to enter into a formal alliance with Cyrus, did nothing to thwart the undertakings of the Persian king against the Medes of Astyages. In fact, the same year (553), Nabonidus left Babylonia to take up residence at the oasis of Teima in Arabia: before leaving, he had to ensure the power bases of his son Belshazzar, whom he left in charge in Babylon.

Offensives and Counteroffensives

Several Classical authors confirm that the victory of Cyrus was difficult and was long in coming. The undeniable treason of Harpagus did not suddenly turn the tide of the war. According to Ctesias (cited by Diodorus IX.23), Astyages then took draconian measures: he dismissed the commanders of the army and appointed trustworthy men; in short, he ruled by terror. Justin (probably depending on the same source) states that after the defeat and the treason of Harpagus, Astyages himself took command of the army and marched against the Persians (I.6.8–17). Nicolaus of Damascus and Polyaeus (VII.6.9) state emphatically that fierce combat was seen in Persia itself, near the site of Pasargadae. The latter writes (VII.6.1):

Cyrus fought three times against the Medes, and he was defeated as many times. He did battle a fourth time at Pasargadae, where the women and children of the Persians were. They, the Persians, took flight yet again. . . . But then they returned to the charge, fell upon the Medes who had scattered in pursuit of them, and achieved a victory so complete that Cyrus had no need to fight again.

He even states that after the first defeats “many Persians defected to the Medes.” The violence and turmoil of the hostilities that developed in Persia are likewise emphasized by Nicolaus of Damascus (*FGrH* 90 F66.16–45). Both Polyaeus and Nicolaus celebrate the valorous conduct of the women who took refuge on a height and exhorted their fathers, brothers, and husbands to refuse defeat—which is the reason why the Great King granted favors to the women every time he visited Persia (Nicolaus of Da-

mascus, *FGrH* 90 F66.43; cf. Plutarch, *Alex.* 69.1 and *Mor.* 246a–b). When this victory was accomplished, Cyrus resumed the offensive against Media and seized Ecbatana, where Astyages had taken refuge. We might imagine that Astyages was counting on the town's fortifications to put up a lengthy resistance: according to Ctesias, he was taken prisoner while hiding in the attic of the royal palace along with his daughter and his son-in-law Spitamas (*Persica*, §2); according to Nicolaus of Damascus, Astyages actually managed to escape; he was taken prisoner only as the result of another battle (*FGrH* 90 F66.45–46).

The New Master of Ecbatana

Now that he was Master of Ecbatana, Cyrus displayed by formal, symbolic acts that dominion had passed to the Persians, who have become “masters of the Medes though they were once their slaves” (Herodotus I.129♦). Wholly surrounded by official ceremony, he entered the royal tent of Astyages, took his place on the throne of the vanquished monarch, and grasped his scepter. His lieutenant Oibaras placed on his head the upright tiara (*kidaris*), a symbol of royalty. The capture of the Median royal treasure also represented a striking sign of his new-found power; Oibaras was entrusted with conveying them to Persia. This booty was certainly of great practical importance; as far as we can tell, it was the first time Cyrus had inexhaustible resources at his disposal for the campaigns to come.

At the same time, Cyrus took care to conduct himself as Astyages' successor. He spared his life and granted him a princely style of life. Cyrus even married Amytis, the daughter of Astyages, say Ctesias and Xenophon. According to Nicolaus of Damascus, it was to the successor of Astyages that several Central Asian peoples (Parthians, Saka, and Bactrians) came to do homage. According to Ctesias, the Bactrians, who had recently revolted, “spontaneously submitted to Amytis and Cyrus” when they learned “that Astyages had become the father of Cyrus and Amytis . . . his wife.” This tradition is suspect, in that it fulfills the wish of Cyrus to present himself as a “chivalrous” conqueror under whose authority the vanquished placed themselves of their own free will. Obviously, the entire Median aristocracy did not take gladly to being deprived of the profits drawn from the dominion exercised by Astyages. But at the same time the tradition agrees that the new master of Media was willing to connect himself with the dynasty he had just overthrown. A strategic center of the greatest importance to whoever wanted to control Central Asia, Ecbatana remained one of the regular residences of the Great Kings. Was it not in Ecbatana, after all, that at the time of Darius a copy of the edict of Cyrus regarding the return of the Judahites to Jerusalem was found? At least as early as 537, the Babylonian House of Egibi did business in the capital of Media, where the court of Cyrus was in residence for several months of the year. Furthermore, there is no doubt that once the defeat was an accomplished fact, some members of the Median elite agreed to cooperate with the new king.

2. The New International Situation and Cyrus's Projects

The Median Territorial and Diplomatic Heritage

For reasons already given, Cyrus's initial conquest must not be reduced to the Median packaging given it, particularly by the Classical sources. It is clear that supremacy

over Ecbatana brought about a profound upheaval in the geopolitical situation throughout the Near East. Cyrus's self-presentation as the heir of Astyages—with Astyages' apparent assent, no less—in fact meant that the new master also assumed the territorial ambitions of his predecessor. This continuity required Cyrus sooner or later to clash with formidable powers, Lydia and the Neo-Babylonian kingdom. When Herodotus writes (I.130♦) that after the fall of Astyages the Persians were “masters of Asia,” he is asserting a programmatic objective more than analyzing a fully realized accomplishment. Even if Nabonidus had seen nothing but benefits in the Medo-Persian conflict, Cyrus's victory plunged him into a situation full of danger. Henceforth, Cyrus's Medo-Persian kingdom and the Neo-Babylonian kingdom were situated as rivals rather than allies.

The assumption of the Median heritage also brought Cyrus the problem of the western front. Ever since 585 there had been a treaty between Astyages and the Lydian king Alyattes, according to which the Halys was the boundary between the Median and Lydian domains (I.74). At the time of the fall of Astyages, the king of Lydia was Croesus, celebrated throughout the Near East and Greece for his wealth and his military power. He controlled the Greek coastal cities, which sent him tribute. He also held all of Anatolia in his grasp, except for Lycia, Cilicia, and Tabal (Cappadocia).

Chronological Problems and Cyrus's Strategy

Analyzing the strategy of Cyrus, however, requires at the very least that we know its stages, which is far from the case. On the contrary, the chronology of the reign of Cyrus remains uncertain, to say the least. Bearing in mind that the date of the capture of Ecbatana continues to be problematic (within a year or two), only two events are precisely dated: the capture of Babylon (539) and the death of Cyrus in Central Asia (530). The chronology of the capture of Sardis remains disputed. In the *Nabonidus Chronicle* (II.13), a paragraph dated Year 9 (547–546) first mentions the death of the mother of Nabonidus at Dür-karāšu, “which is on the bank of the Euphrates above Sippar.” In May of the same year, the *Chronicle* says, Cyrus gathered his army and crossed the Tigris below Arbela. Another expedition led by Cyrus against a country whose name is unreadable is mentioned next: “Cyrus killed its king, took his possessions, and stationed his own garrison there; the king and the garrison resided there.”

Contrary to what has long been believed, this text does not appear to refer to Cyrus's campaign against Lydia. Thus, the capture of Sardis is dated either to 546 or to 542–541. The first date assumes that the Lydian-Persian war followed the Medo-Persian hostilities almost immediately; the second date results from supposing that Cyrus led a series of campaigns in Central Asia and on the Iranian Plateau between the capture of Ecbatana and the capture of Sardis. The problem is that the chronology in Herodotus is highly uncertain. Following convention, we will here adopt the first proposal (the more widely favored), while agreeing that between 546 and 540 Cyrus carried out operations in Central Asia and that the operations against Babylonian positions probably began well before 540.

Furthermore, Herodotus says, the initiative was not Cyrus's at all. He draws the opposite conclusion from the entire story—that the war was instigated by Croesus, who was uneasy because Cyrus “had destroyed the empire of Astyages, and the power of Persia was steadily increasing” (I.46♦). Desirous of expanding his domains to the east and following the example of his predecessors, Croesus managed to present the operations that ensued as an expedition intended to avenge his brother-in-law Astyages: “Croesus had a

craving to extend his territories. . . . He prepared an expedition in Cappadocia, sure of success in bringing down the power of Cyrus and the Persians" (I.71; I.73♦). In short, Croesus intended to profit from the new international situation by abrogating the treaty of 585 that had set the Halys as the limit of Lydian expansion.

3. *The Defeat of Croesus and the Establishment of a Mediterranean Front*

The Successful Counterattack by Cyrus (547–546)

Whatever Cyrus's strategic intentions may have been, the offensive by Croesus left him no choice. He now found himself at the head of an army considerably reinforced by the troops raised in Media and by the contingents brought to him by the Central Asian chieftains who had submitted after the fall of Ecbatana. As he advanced, he also mobilized the men of the regions he was crossing so successfully that, according to Herodotus (I.77), the Persian conqueror possessed an undeniable numerical superiority over Croesus. He likewise possessed powerful siege engines that served him well at Sardis and elsewhere. He intended once and for all to settle the quarrels between Media and Lydia. As Diodorus of Sicily tells it (IX.32.3), upon his arrival in Cappadocia, Cyrus sent an envoy to Croesus to let him know that he could remain in Lydia but as no more than satrap of the region. He was in effect proposing that his adversary recognize Persian dominion without a fight. One can imagine the response of the master of Sardis.

Croesus was clearly very confident facing Cyrus. He had concluded a "treaty of hospitality and alliance" with Sparta, from which he could count on fresh reinforcements. He had also sent many embassies and sumptuous gifts to the sanctuary at Delphi. Questioned at his behest, the oracle had responded ambiguously, as usual, reported thus by Herodotus (I.53♦): "If Croesus attacked the Persians, he would destroy a great empire": history was to show Croesus that it was the Lydian kingdom that would vanish. Elsewhere, there were treaties with the Neo-Babylonian kingdom and with Pharaoh Amasis. It appears that the latter sent troops, who would play an important part in various offensives against the Persians. Babylon, on the other hand, did not intervene. We may imagine that Nabonidus (still in Arabia) and Belshazzar (his son and regent in Babylon) did not take an unhappy view of the conflict between their two main rivals. Cyrus attempted to instigate defections among his enemy's allies: upon notification of the offensive by Croesus and "before starting he had sent representatives to the Ionians in an attempt to detach them from Croesus, but without success" (Herodotus I.76♦). The Ionians would soon pay heavily for their error in judgment.

The rash offensive of Croesus beyond the Halys ran into the army of Cyrus. The battle that unfolded in Cappadocia at Pteria (Boghazköy?) was not decisive. Croesus soon decided to retreat and take advantage of the winter to gather a powerful army, counting on receiving reinforcements from his nominal allies. He dispersed the army he had led in Cappadocia to its winter quarters. Imprudently, but also unexpectedly, Cyrus attacked in the dead of winter and took the Lydian army by surprise, just when it was about to be demobilized.

This bold attack was the result of keen logistic and political analysis. Cyrus had everything to fear from a reinforced Lydian army, whose valor and courage Herodotus extols (I.79–80). The decisions made by Croesus after Pteria provided Cyrus an opportunity to overcome an enemy who was in theory superior. The Persian king also understood well

that a defeat would have raised hopes among yesterday's vanquished of throwing off a dominion that was as fragile as it was recent. Nor did he disregard the fact that at this time the lands of Central Asia were uneasy. Finally, he intended to profit immediately from the conflicts that the partial defeat of Croesus had provoked in the Greek cities of the Anatolian coast. It also seems likely that the Greeks sent no reinforcements to Sardis after Cyrus's arrival in Lydia was confirmed. After the battle of Pteria, Miletus, a traditionally "Medizing" city, had let Cyrus know that it was ready for terms. In other Greek cities, the struggles between "Medizing" and "Lydianizing" factions had flared up, the former hoping to profit from the victory of Cyrus that they desired. An Ephesian, Eurybates, whom Croesus had commissioned to recruit mercenaries in the Peloponnese, had already defected to Cyrus. His story was probably not unique: it is perhaps on this occasion that Pytharcus of Cyzicus received from Cyrus the revenues of seven cities of Asia Minor.

It would have been a grave political and strategic error on Cyrus's part to allow Croesus the time to regain undivided dominion over the Greeks of Asia Minor. The Persian's calculations proved to be precise. In the face of a tactical situation that was not entirely in his favor, Cyrus staged a battle close to Sardis, which forced Croesus to take refuge in the citadel, which was thought to be impregnable. The Lydian king sent desperate pleas to his allies. But, as the result of a strategem, the city fell on the fourteenth day of the siege, and the news reached Sparta just as relief was setting out for Asia Minor. The fall of Sardis sent a shock wave throughout the Near East nearly as great as that which had attended the fall of Nineveh in 612.

Takeover of the Lydian Kingdom

So Cyrus entered Sardis, where Croesus gave himself up. Thereafter, he remained in the entourage of Cyrus, who gave him a Median city as a grant, the revenue from which allowed the defeated king to maintain his accustomed lifestyle. The contents of the treasure-houses of Sardis were sent to Cyrus, who had them transported toward the center of his empire-in-the-making. The town of Sardis was provided with a garrison entrusted to Tabalus, a Persian.

The taking of Sardis nonetheless did not completely settle the question. Cities and dynasts of Asia Minor remained to be subjugated. Only one city, Miletus, had surrendered prior to the fall of Sardis, in consideration of which it "obtained the same terms from Cyrus as from Croesus" (I.141♦) that sheltered it from the Persian offensive (I.143): "It enjoyed tranquility" (I.169). According to Herodotus (I.141♦), "The Ionians and Aeolians immediately after the Persian conquest of Lydia sent representatives to Cyrus at Sardis, to try to obtain from him the same terms as they had had under Croesus." The king returned a refusal: he insisted that the Greek cities surrender unconditionally. They had to choose between bowing to Cyrus's will or organizing resistance. They chose the second solution, and "began to erect defences" (I.141♦). They also sent an embassy to Sparta requesting aid against the Persians. The Spartans rejected the request of the Ionians but sent observers, and when Cyrus received them at Sardis, they presumed to forbid the king "to destroy a single city in Greek lands." This was scarcely a realistic demand, if indeed it was ever made. Cyrus rejected it haughtily and not without a measure of contempt (I.152-53). The Greek cities thus faced the Persian conqueror on their own.

Despite their isolation and the Lydian defeat, the leaders of the Greek cities were probably counting on one element in their favor. Herodotus (I.153♦) specifies that Cyrus "himself started eastward on his march to Ecbatana [quite rapidly]. . . . He did not think the Ionians important enough to constitute a primary objective, for his mind was on Babylon and the Bactrians and the Saka and the Egyptians, against whom he intended to lead an expedition in person. Some other commander would suffice to tackle the Ionians." In other words, beginning in the spring of 546, Cyrus had to conduct operations on several fronts at once.

The Revolt of Pactyes

As soon as Cyrus left, "seeing the king occupied with other wars, the Lydians revolted," as Justin puts it (I.7.11). This late author is clearly referring to the revolt led by the Lydian Pactyes, whom Cyrus had assigned to gather tribute. Provided with these resources, "Pactyes induced the Lydians to rise against their Persian governor, and going down to the coast was enabled by his possession of the Sardian gold to hire soldiers and persuade the men from the coastal districts to support him. He then marched against Sardis and laid siege to Tabalus, who was shut up in the inner fortress of the city" (Herodotus, I.154♦). Thus was formed a very dangerous coalition against the Persians, between Lydians who had not accepted the defeat and the Greek cities that had refused to submit to Cyrus. To explain how the Persians succeeded is also to understand (at least in part) the methods that the Persians used to establish their sovereignty in the conquered countries.

Advised about the revolt on the way to Ecbatana, Cyrus sent the Mede Mazares back, entrusting him with some of his troops, and issued an order "to sell into slavery everybody who had joined in the Lydian attack on Sardis. Pactyes himself was at all costs to be taken alive and brought before him."♦ Pactyes chose to leave Sardis and take refuge in Cyme, a Greek city of Aeolis. Pressed by Mazares to hand over the rebel, the Cymeans queried the oracle of the sanctuary of Branchidae, near Miletus. Twice, the oracle told the Cymeans to obey the Persian order. To avoid reprisals, the Cymeans sent Pactyes away to Mytilene, on Lesbos; then, learning that the Mytilenians were negotiating the price of their hostage, they sent the rebel to Chios. The Chians handed him over to the Persians in return for the grant of a tract on the mainland, at Atarnaeus.

This episode elicits some comments. For all that remains unknown of the background of Pactyes, it seems clear that he was an important man in the time of Croesus, and it therefore seems that at Sardis Cyrus did not hesitate to call on local officials to stabilize the period of transition. This was not without risk, as was soon bitterly evident. Similarly, another of the missions entrusted to Mazares was to demobilize all the Lydians in a manner that would prevent any new armed revolt against Persian dominion. This picturesque language must surely be understood to mean that he intended the army to be placed entirely under the command of Medes and Persians. Furthermore, the reaction of the Greek cities to the demands of Mazares must be accounted for. One of them, Cyme, refused to join the armed resistance because its inhabitants could not "survive a siege." If Mytilene and Chios harbored the fugitive, it is because they were offshore cities that, in Herodotus's words (I.143♦), "had nothing to fear," for the Persians did not yet have a trained navy, whereas "the Ionians attained to great naval strength" (Thucydides I.13.6♦). Moreover, neither Mytilene nor Chios wished to test themselves

against the Persians; instead they sought commercial advantage from the situation. In other words, there was neither cooperation nor enough community of interest between insular and continental cities to oppose the Persian conquerors.

It is also important to emphasize the reaction of the oracle of Branchidae, who twice urged the Cymeans to obey Mazares. This oracle worked in the sanctuary of Apollo of Didyma, near Miletus, named by Herodotus for the family, the Branchidae, who were traditionally responsible for its maintenance. Its good neighborly relations with Croesus are abundantly illustrated by the gifts offered on several occasions by the Lydian sovereign. It appears that Cyrus did the same, which doubtless resulted in the oracle's interference in the Mazares affair. Good relations between Cyrus and another sanctuary of Apollo, Aulai near Magnesia on the Meander, are evidenced in a document from the time of Darius, who reports the benefactions of his ancestors to the sanctuary (ML 12). Cyrus also maintained the sanctuary of Apollo at Claros, near Ephesus. These examples indicate that from the outset Cyrus felt the need to seek the good will of the local sanctuaries—a policy that he followed at Babylon and that his successors were later to extend throughout their empire.

Harpagus in Asia Minor

After the capture of Pactyes, Mazares began to reduce the cities that had collaborated with the rebel one by one: Priene and Magnesia were ravaged. After the death of Mazares, Cyrus sent another Mede, Harpagus, the same man who had deserted Astyages for Cyrus, to Asia Minor. Diodorus (IX.35♦) gives him the title “commander on the sea.” No doubt he commanded other generals, Hystaspes and Adousios, both named by Xenophon (Cyr. VII.4.1–7; VIII.6.7). Knowing themselves unable to resist a siege, several communities (Phocaea, Teos) chose the path of exile. The other cities were conquered one by one, and Persian garrisons were stationed there. The Ionians had to provide contingents to Harpagus, who advanced toward Caria and Lycia: “The Carians were reduced to slavery by Harpagus, and in the fighting neither they nor any of the Greeks who lived in this part of the country managed to distinguish themselves” (Herodotus I.174♦). As for the inhabitants of Xanthus and Caunus in Lycia, they preferred death to submission (at least in the rather stereotyped version recorded by the historian of Halicarnassus; Herodotus I.175–76).

Despite the impression given by Herodotus's story, the Persian conquests were neither rapid nor easy, since it took at least four years for Cyrus's generals to establish their superiority. “In this way Ionia was once more reduced to subjection,” concludes Herodotus (I.169♦), alluding to the previous Lydian dominion. We still must point out that, contrary to what the Halicarnassian historian supposes, the Ionians of the islands remained largely outside the reach of Achaemenid expansion.

4. Cyrus in Central Asia

“While Harpagus was turning upside-down the lower, or western, part of Asia, Cyrus was engaged with the north and east, bringing into subjection every nation without exception,” writes Herodotus (I.177♦). We have seen how in the spring of 546 the king had left Asia Minor, called back by more pressing dangers: Babylon, the Saka and Bactrians, and Egypt, according to Herodotus (I.153). Unfortunately, the chronology, the timing, and the methods of the expeditions in Central Asia are very poorly known. The main

reason is that Herodotus breathes not a word of the marches against the Saka and the Bactrians, passing directly (I.178–200) to the final offensive against Babylon, which took place beginning in 540, and then to the king's combat with the Massagetae, where Cyrus met his death in 530 (I.206–7). Herodotus does not conceal, though, that he made a deliberate choice from the information available to him: "Most of his minor conquests I will say nothing about, but mention only those of his campaigns which gave him the greatest trouble and are in themselves the most interesting." ♦ As a result of selection criteria that are not necessarily the same as ours, Herodotus preferred to devote long digressions to the description of Babylon and Babylonian customs (I.178–88; 192–200) and to the manners and customs of the Massagetae of Central Asia (I.201–4; 215–16), rather than offering his readers a chronologically continuous tale of the expeditions of Cyrus. In the absence of Herodotus, we must resort to fragmentary, confused, and late sources: Ctesias (summarized by Photius) and the court historians of Alexander, who were ready and willing to identify the footprints of Cyrus beneath the steps of the Macedonian. In short, the available materials do not allow us to establish securely the chronology of the Persian expeditions in Central Asia, and they are silent on the likely occurrence of simultaneous military operations on the Babylonian and Central Asian fronts.

The reference in Herodotus to Saka and Bactrians among the dangers facing Cyrus after the capture of Sardis indicates at least that the submission that the Central Asian peoples (Hyrcanians, Parthians, Saka, Bactrians) had been willing to tender to Cyrus after the capture of Ecbatana had been no more than circumstantial and formal. Justin confirms this by writing (I.7.2): "When power changed hands, the states that until then were tributary to the Medes believed their situation also to be changed and revolted against Cyrus, and this defection was for Cyrus the cause and origin of numerous wars." To impose his own authority, it was not enough, then, for the Achaemenid to identify with Astyages; he had to appear in person at the head of his armies.

The geopolitics of the countries of the Iranian Plateau and Central Asia in the period preceding the Achaemenid conquest (first part of the first millennium) is very poorly known mainly because of the absence of credible and indisputable written sources. Bactria in the broader sense—from the Hindu Kush to the Syr Darya—probably represented the region's most important center, although we cannot say with certainty what its political structures may have been. At any rate, this whole region of northern Afghanistan was celebrated as far back as the third millennium for material culture and artistic achievement that in our eyes rival those of the great Mesopotamian centers. There had always been fruitful exchanges between Central Asia and Mesopotamia along the great routes through the south and north (called the Khorasan Road in later times), along which men and merchandise traveled, especially the lapis lazuli from Badakhshan in Bactria that was so prized in Mesopotamia. The agricultural wealth of the great oases of pre-Achaemenid Bactria is thrown into high relief by the gigantic irrigation works that served them and that surveys have revealed in the basin of the Upper Oxus (Amu Darya). Bactria was also a military power that could mobilize armies of renowned cavalry (30,000 at the time of Darius III, according to Quintus Curtius VII.4.30). This Bactria was in close contact with the Iranian-speaking Saka people ("Saka" in Old Persian, "Scythians" in Greek), some of whom were nomadic, others of whom lived not only on stockbreeding but also on agriculture and on commerce beyond the Syr Darya as far as Siberia. They were very powerful peoples in their own right, organized in confederations of tribes,

clans, and kingdoms, and the qualities of their horsemen and bowmen are revealed in striking fashion as much by the figural representations in the art of the steppes as by the place they were to take in the Achaemenid armies and in the tales of Alexander's companions. The close relations between the Saka and the Bactrians made a military expedition in Central Asia even more difficult and risky.

It would be illusory and pointless to try to reconstruct the campaigns of Cyrus. We must be satisfied with a few details found by chance in the ancient texts. We know in particular that Cyrus established several garrison towns on the northern frontier, especially the famous Cyropolis, which would be destroyed and then rebuilt by Alexander. Cyrus's passage to the south of the Iranian Plateau is discernible in Seistan (the valley of the Helmand), where a local population, the Ariaspi, provided fresh supplies just when his army was in distress after leaving the desert. Late texts also seem to indicate that Cyrus, during the same expedition or on another occasion, crossed the region of the river of Kabul (the Gandhara of the royal inscriptions), as well as Gedrosia and Carmania. It is perhaps also from this period that the fortress of Old Kandahār, the Achaemenid capital of Arachosia, dates. It is tempting to suppose that Cyrus had subdued (or crossed) the Iranian countries that Darius, at the beginning of his reign, portrays as already conquered: Parthia, Drangiana, Aria, Chorasmia, Bactria, Sogdiana, Gandhara, Scythia, Sattagydia, Arachosia, and Makran. On the other hand, it is certain that he never penetrated the Indus Valley.

5. The Capture of Babylon (539)

Sources and Problems

The Neo-Babylonian kingdom now remained Cyrus's most formidable adversary and rival in the Near East. There is no lack of information on this part of the conquest, but the sources are both fragmentary and one-sided. They are first and foremost cuneiform texts: the Cyrus Cylinder (*Cylinder*), the Nabonidus Chronicle (*Chronicle*), and the Cyrus Panegyric [commonly known as *Verse Account of Nabonidus*]. The victory of Cyrus is also "foreseen" in a dynastic prophecy of the Hellenistic era: Cyrus, who is identifiable under the name "king of Elam," takes the throne of a king (Nabonidus) who had reigned seventeen years. In often similar terms, the Babylonian texts—especially the first three—express the point of view of the conqueror. In these texts a conventional interpretation that systematically contrasts the behavior of Cyrus and Nabonidus can be recognized. This is not the viewpoint of the *Dynastic Prophecy*, in which the policy of Cyrus is denounced as aggressive (II.22–24).

The *Chronicle* stresses the fact that during the absence of Nabonidus (then in Teima in Arabia until his seventeenth year), the Babylonian New Year's festival (*Akitu*) was not celebrated with all of the traditional pomp. In the *Cylinder*, Nabonidus is presented as an impious king: he deported the divine statues, "the worship of Marduk, the king of the gods, he made it fall into oblivion" (?), he imposed "a cult that was not proper to them." He was an unjust king in the treatment of his subjects as well: "He did evil toward his city without ceasing. Each day . . . [he tormented his people]. Under a pitiless yoke he crushed them all." An equally severe portrayal is found in the *Verse Account*: there Nabonidus is accused of all evil, in particular of having interrupted the Babylonian New Year in favor of the cult observed at Harran in honor of the god Šin. Similarly, in the *Dynastic Prophecy*, Nabonidus is the creator of a dynasty centered on Harran; he suppressed the New Year ritual, and he oppressed Akkad.

Let us return to the *Cylinder*. In this context, the “people of Sumer and Akkad” turned away from Nabonidus and appealed to Marduk, who took pity on the Babylonians: “He then found a just prince, according to his heart, and took him by the hand. He pronounced the name of Cyrus, king of Anšan; he then called his name to sovereignty over all.” Satisfied with Cyrus (whom his aid permitted to seize the country of Gutium and to conquer the Medes), Marduk “commanded him to turn toward Babylon, his city, and made him take the way to Babylon. As a friend and companion, he marched at his side.” It is thus as the chosen of the great Babylonian deity that Cyrus entered Babylon at the head of his army “without combat or battle”; thus Marduk “saved his city of Babylon from distress; he delivered to him Nabonidus, the king who did not worship him. The people of Babylon, all of them, the whole country of Sumer and Akkad, lords and governors, all bowed before his royalty, their visage shone.” In the second part of the *Cylinder*, Cyrus speaks in the first person: after presenting his titulature, he twice states that he and his army entered “Babylon peacefully,” and he recounts his many pious actions, in particular the return of the divine statues that Nabonidus had deported. The *Chronicle* also specifies that the first Persian detachment (led by Gūbaru/Ugbaru) penetrated Babylon “without a battle” and that with Cyrus’s arrival “peace reigned.”

From these texts a canonical image of Cyrus has been derived, one that corresponds very closely to that found in the Jewish literature (see p. 46 below). It is also found in the Greek tradition, especially in Xenophon, who represents his power as accepted by the vanquished “with their consent” (*Cyr.* I.1.4; cf. Diodorus IX.24). Unhappy with Nabonidus’s impiety, the Babylonians, led by their priests, supposedly opened the gates voluntarily to the “just king,” Cyrus, who from that moment on was received as a “liberator.” This traditional interpretation evokes suspicion to the extent that it agrees with the image that Persian propaganda itself would have portrayed.

The Military Conquest

It appears *prima facie* unlikely that Babylonia could have fallen without resistance. Besides, the *Chronicle* (III.12–13) refers directly to an initial battle won by Cyrus at Opis on the Tigris, dated 10 October 539. This victory was followed by an immense haul of booty and the massacre of those who attempted to resist (III.14). The *Chronicle* continues: “The fourteenth day, Sippar was taken without a fight; Nabonidus took flight” (III.14–15). Then, “Ugbaru, governor of the district of Gutium, and the army of Cyrus entered Babylon without a battle. Then, after his retreat, Nabonidus was captured in Babylon.” The capture of Babylon is dated 12 October.

Before returning to the capture of Babylon specifically, we must stress that direct hostilities between the Persians and Nabonidus’s troops had perhaps (or probably?) begun before 540. The *Chronicle* (III.9–12) specifies that the cult statues of several Babylonian sanctuaries were brought to Babylon, a sign that Nabonidus had taken measures designed to prevent the Persians from capturing these divine statues. There is no doubt that the Persian threat had become serious. Moreover, one text may allude to hostilities in the Uruk region in the winter of 540–539.

As far as it can be reconstructed, the story of Ugbaru—the first of Cyrus’s officers to enter Babylon—itself seems to indicate that the offensive against the Neo-Babylonian possessions had begun at a still earlier period. Ugbaru is referred to in the *Chronicle* with the title “governor of the country of Gutium.” According to the *Cylinder* (§13), Cyrus

achieved his first victories, under the protection of Marduk, over "the country of Gutium and over all the troops of Manda [Medes]." This Ugbaru is probably the Gobryas who, according to Xenophon, left the Babylonian side and switched to Cyrus. He commanded a vast region (Cyr. IV.6.1–11) at whose frontiers the Neo-Babylonian territory began (V.3.1). It was from the territory of Gobryas that Cyrus launched the attack on Babylon (V.2.1–21); it was Gobryas who guided Cyrus's army (V.2.22); he also was the one who took Babylon (VII.5.26–30). As fictionalized as it is, Xenophon's tale seems nonetheless to be based on oral transmission of Ugbaru's story. Ugbaru must have been the Babylonian governor of a territory situated in the foothills of the Diyala that, some years before 540, had seceded and was taking orders from Cyrus. Herodotus (I.189) states further that after his offensive against Babylon Cyrus passed through this region of the Diyala on a road that led to Opis. We thus realize that Nabonidus had massed his troops in this town in a manner that prevented passage over the Tigris by the army of Cyrus. The massacres perpetrated by Cyrus's troops after the battle attest to the vigor of the resistance of the Neo-Babylonian army. It is probably then (or a little before or after) that Susa fell into Cyrus's hands, and the last Neo-Elamite kingdom disappeared once and for all.

The capture of Sippar and the retreat of Nabonidus to Babylon suggest that the Neo-Babylonian king had decided to lead the resistance in the capital. According to Herodotus (I.190*), at the approach of Cyrus, "the Babylonians had taken the field and were awaiting his approach. As soon as he was within striking distance of the city they attacked him but were defeated and forced to retire inside their defenses." According to Berossus, the Babylonian army was led by Nabonidus himself, who fled to Borsippa after the defeat (Josephus, *Ag. Ap.* I.150–53). However, Cyrus had not yet succeeded completely. Herodotus notes that the Babylonians had stockpiled provisions that would allow them to hold out for several years. Like Xenophon (Cyr. VII.5.1ff.), he describes the problems faced by Cyrus, who was unable to take a powerfully fortified town defended by troops resolutely determined to resist. Diverting the waters of the Euphrates enabled him to infiltrate a small company led by Ugbaru, who took advantage of the fact that the Babylonians were then celebrating a major festival. He surrounded the sanctuary of Esagila and took the strong points. A few days later, Cyrus was able to make his entrance into Babylon in the traditional ceremony. Nabonidus was taken prisoner but his life was spared. Beginning in the middle of October 539, tablets are dated by Cyrus's first regnal year.

The first conclusion drawn from this analysis is that the rapidity of the conquest is a distortion introduced by the methods of composition employed by the author of the *Chronicle*, whose object was not to describe military campaigns in detail. He thus left out information that the modern historian considers fundamental. Composed from the point of view of a Babylonian chronicler, the text mentions the Persians only to the extent that their actions concern the history of Babylonia or at least allow Babylonian events proper to be dated in a synchronic perspective (the fall of Astyages to Cyrus [II.1–4], Cyrus's first campaign against an unknown land [II.15–18], the victories of Cyrus in 539); hence the total silence regarding the activities of Cyrus between 547 and 539. Because of this, we know nothing of Persian-Babylonian relations during the long period that covers both Nabonidus's residence in Teima and the conquests achieved by Cyrus from 547 to 539. These gaps in the record necessarily shrink the Persian-Babylonian war to a very short period in autumn 539. But we have good reason to believe that Cyrus's progress did not go unnoticed by the Babylonian court. In other words, the war of 540–

539 was probably just the last stage of hostilities for which we unfortunately have few details. This implies that the suddenness of the conquest of 539 is also probably illusory.

From Nabonidus to Cyrus

The systematic contrast drawn between the impious behavior of Nabonidus and the pious attitude of Cyrus should not be taken at face value. It is doubtful that even before the fall of the town Cyrus was impatiently awaited by a population desperate for a “liberator.” In particular, there is no sure proof that Cyrus forged amicable relations with the Babylonian clergy. Just as is true for Media or Lydia, the Persian victory over Babylon cannot be explained solely in terms of betrayals that made it considerably easier. The “triumphal” entry of the Persian king into Babylon does not imply unreserved submission by the Babylonians. In its style and method—very like those of Alexander in 331—the entry simply symbolized the obligations laid on a conquered town to demonstrate its allegiance to the new master.

Nevertheless, the *Cylinder* also allows us to understand what kind of propaganda the new regime put out in order to attract the cooperation of the local elite. Literary analysis of the text leads at once to the observation that Cyrus portrays himself as restoring the divine and earthly order that was set awry by the actions of Nabonidus. Here, as well as in the *Verse Account*, the Babylonian king is denounced for promoting the cult of the moon-god Sîn at the expense of the cult of Marduk. We do know that from the beginning of his reign Nabonidus had intended to restore the sanctuary (Eḫulḫul) of Sîn in the Syrian city of Harran, but it was not until his return from Teima that he began to execute his plan. The motivations of Nabonidus remain in the realm of theory, but in any case, there is no sure proof that in doing this the king would have lost the support of the Babylonian social elite.

Nevertheless, Cyrus represents himself as the restorer of destroyed or abandoned civil and cult structures, beginning at Babylon, as a fragment of the *Cylinder* suggests. Cyrus claims to have rebuilt the fortifications and other structures at Babylon, but also at many other sites of Nabonidus’s former kingdom:

Of Nin[evah], Aššur, and also of Susa, of Agade, of Ešnunna, of Zamban, of Meturnu and of Der, up to the borders of Gutium, the cult centers beyond the Tigris, whose [cult] structures had long remained in ruins, I returned to their place the gods who lived there and re-established them for eternity. I gathered all their people and returned their habitations. And the gods of Sumer and Akkad whom Nabonidus, to the wrath of the lord of the gods [Marduk], had transported to Babylon, I had them, on the order of Marduk, the great lord, joyfully installed in their cella, in a dwelling for the joy of the heart. . . .

Several foundation documents from Uruk temples in fact bear the signature of Cyrus: “Cyrus, king of the lands, who loves Esagila and Ezida, son of Cambyses, powerful king, me.” It is the same in other centers. But these statements must be put in perspective. Whether it is the sanctuary of Agade, the walls of Babylon, a gate of Uruk, or even the ziggurat of Ur, all these structures had already been restored by Nabonidus, whose activity as an archaeologist-restorer is abundantly documented. The building records of the last Neo-Babylonian king are no fewer than those that mention Cyrus.

By means of the geographic variety of the structures listed, Cyrus was primarily proclaiming his intention of taking over all the territories of the vanquished kingdom. His statement also allowed him to relegate the reign of Nabonidus to the forgotten pages of history. In a fragment of the *Cylinder*, Cyrus states that during the work carried out on a

gate of the city he discovered the name of the great Assyrian king, Aššurbanipal, whom he presents as one of his predecessors. This passage is still more interesting because even before the discovery of the fragment, it had been shown that the text of the *Cyrus Cylinder* was composed on the model of inscriptions of Aššurbanipal. He also claims that at the beginning of his reign he had brought the statue of Marduk back to Babylon and made financial arrangements for regular sacrifices.

Nabonidus himself in several inscriptions had not hesitated to associate himself with illustrious predecessors of the dynasty, particularly Nebuchadnezzar II and Neriglissar; naming them was likewise an attempt to justify the power he usurped in a coup d'état. He too cited Aššurbanipal as a model for his actions. But his later decrees diminishing the importance of Marduk had weakened his position. It became easy for Cyrus to publish counterpropaganda. It is likely that, in recalling the figure of Aššurbanipal, the Babylonian ruling classes expressed their longing for a period that in image and imagination was considered the apogee of Babylonian history. For his part, Cyrus offered himself not as a conquering outsider but as a legitimate king, coming to mend the thread of ancient Babylonian history. In the same spirit, he took up a traditional titulature. While he recalled that he was "son of the great king Cambyses, king of the city of Anšan, grandson of the great king Cyrus, king of the city of Anšan, great-grandson of the great king Teispes, king of Anšan," he also presented himself in the following way: "I am Cyrus, king of the world, great king, powerful king, king of Babylon, king of the country of Sumer and Akkad, king of the four corners of the earth."

Fidelity to the model of Aššurbanipal and the assumption of his titulature constituted a display of Cyrus's imperial program after his entry into Babylon. Without in the least breaking with his Persian heritage (the construction of Pasargadae illustrates this continuity), the conqueror intended to situate himself as the heir of ancient Assyrian power. The successive defeats of Astyages, Croesus, and Nabonidus enabled him to be considered "king of the world." To a certain extent, it may be thought that the capture of Babylon in 539 brought to a close a period of simultaneous equilibrium and uncertainty that began with the fall of the Assyrian Empire in 612–610. For several decades, the Neo-Babylonian and Median kingdoms had fought over the Assyrian heritage. The victory of Cyrus over both settled the question in his favor.

From the point of view of the Babylonians, Cyrus's victory could signify the reconstruction of the old empire. Crown prince Cambyses was recognized for several months as "king of Babylon"; perhaps he presided over the New Year's festival. But, for the victorious king, the fall of Babylon marked the consecration of a new empire that already extended from the Aegean to Central Asia. In this sense, the *Cylinder* does more than represent the opinion of the Babylonian elites; it also transmits the imperial program of Cyrus. The agreement between the two could not be founded on anything but ambiguities and second thoughts, for the Babylonians faced the problem of the integration of their country into an infinitely vaster whole; they risked losing their individuality, which had been restored with such apparent solemnity.

6. *Cyrus, Trans-Euphrates, and Egypt*

Trans-Euphrates after the Capture of Babylon

Once he was master of Babylon, Cyrus could in principle have claimed the Neo-Babylonian inheritance in the Syro-Palestinian territories, which were traditionally dis-

puted between the masters of Babylon and the masters of Egypt, and where populations exhibiting very great ethnocultural diversity lived side by side: Phoenicians in their great port centers (Tyre, Sidon), Arameans, Hebrews, Palestinians, Arabs, and even Greeks settled in several coastal enclaves. The Neo-Babylonian kings had pursued a consistent and ambitious policy toward these territories with the specific intent of opening an outlet on the Mediterranean and profiting from Mediterranean and Arab trade. Thus they wished to dominate the Phoenician and Palestinian cities, in particular Gaza, which was largely Arabized and was the principal outlet for the trade in aromatics from South Arabia dominated by the kingdom of Saba. Moreover, in these regions the Mesopotamian sovereigns found the raw materials they lacked, such as wood from Lebanon and iron from Cilicia. This is why numerous expeditions were launched to subdue independent kingdoms (Damascus, Israel, Phoenician cities) and to hold in check the peoples of the northern Arabian Peninsula. During his reign, Nabonidus had waged many wars in Cilicia, Syria, Transjordan, and Arabia. His long stay at Teima can be explained in large part by a desire for control of the region.

Among the ancient civilizations of these territories was Judah. Judah had always maintained complex and often hostile relations with Assyro-Babylonian power, frequently attempting to maintain a dangerous policy of swinging in allegiance between Egypt and Babylonia. Let us review the immediately preceding events, which will help make sense of Cyrus's actions in the situation. After Pharaoh Necho II's victory at Megiddo in 609, Judah was incorporated into the Egyptian sphere of influence. At the same time, the ruin of the Neo-Assyrian Empire and the appearance of the Neo-Babylonian kingdom placed the Judahite leaders in an uncomfortable situation: they had to choose between Egypt and Babylonia, without in reality having the means of exerting any influence in the struggle between the two powers. In 605, Pharaoh Necho, who had just been defeated at Carchemish by the Babylonian king Nebuchadnezzar II, deposed the king of Judah, Jehoahaz, and replaced him with Jehoiakim. Jehoiakim saw an opportunity to take advantage of the Babylonian setback by revolting (about 600). In 598–597, when Jehoiachin had succeeded his father, Nebuchadnezzar in person marched against Jerusalem, which fell in March 597. A significant portion of the Judahite elite (royal family, military chiefs, nobles, landowners, priests) were taken captive to Babylonia, and a new king, Zedekiah, was installed by Nebuchadnezzar. Seduced by the promises of the pharaoh, Zedekiah tried to form an anti-Babylonian coalition around Judah. But circumstances were hardly favorable to him. Weakened and impoverished after the disaster of 597, the kingdom of Judah was also torn by internal quarrels, the faction favoring insurrection bitterly opposed by the advocates of submission, the most famous of whom is the prophet Jeremiah, who portrayed the Babylonian victory as a punishment sent by Yahweh against his unfaithful people. It should be added that the pharaoh was not inclined to support Zedekiah unconditionally. The offensive launched by the powerful Babylonian armies breached the Judahite defenses; in the summer of 587 Jerusalem fell, King Zedekiah was imprisoned and his sons massacred before his eyes, the town, the Temple, and other urban centers were razed, and another deportation ensued. A Judahite governor was installed by the Babylonians, but this governor took his orders from Babylon and the population under his authority was reduced in number and impoverished. The kingdom of Judah had ceased to exist; it had become an integral part of the Neo-Babylonian kingdom.

Cyrus and Jerusalem

The figure of Cyrus is unreservedly praised in the Jewish sources. It is possible that, as early as his arrival in Babylon, Cyrus had cemented relations with the leaders of the Jewish community in exile, in whose hands the traditions of the mother country were being maintained, despite significant integration into Babylonian society. It was at Babylon that the prophet Ezekiel had begun to preach in 593. He led his hearers to hope for a return to Jerusalem, the rebuilding of the Temple and the resumption of worship, as well as the renewal of the unified kingdom of Israel and Judah.

The terms used by the author of Second Isaiah are reminiscent of certain passages in the *Cyrus Cylinder*:

Who roused from the east him that victory hails at every step? Who presents him with nations, subdues kings to him? His sword makes dust of them and his bow scatters them like straw. He pursues them and advances unhindered, his feet scarcely touching the road. Who is the author of this deed if not he who calls the generations from the beginning? I, Yahweh, who am the first and shall be with the last. (Isa 41:2-4)

Then the alliance between Cyrus and Yahweh is made explicit:

Thus says Yahweh to his anointed, to Cyrus, whom he has taken by his right hand to subdue nations before him and strip the loins of kings, to force gateways before him that their gates be closed no more: I will go before you levelling the heights. I will shatter the bronze gateways, smash the iron bars. I will give you the hidden treasures, the secret hoards, that you may know that I am Yahweh. (Isa 45:1-3)

Chosen and directed by Yahweh—as he was by Marduk at Babylon—the Cyrus of the biblical sources no longer belongs to History; he becomes an ornament and a mythic figure of a Judeocentric history. But historians cannot choose their sources, here any more than elsewhere. In the absence of any other viewpoint, every attempt to understand the intentions and objectives of Cyrus's policy toward the Jewish community must be based on the Jewish literature.

The facts are known entirely from quotations and references to documents purporting to be official documents of the Achaemenid chancellery. These quotations are found in the book of Ezra. The first passage presents a proclamation attributed to Cyrus, inspired by Yahweh: the king is said to authorize the rebuilding of the Temple in Jerusalem and to permit the exiled Judahites to return to their homeland. The order is said to be given to the treasurer Mithradata to return the sacred vessels, originally brought to Babylon by Nebuchadnezzar, to Sheshbazzar, "prince of Judah." Tyrians and Sidonians were to be conscripted to transport the wood needed for the project from Lebanon to Jerusalem (Ezra 1:1-4, 3:6). Furthermore, at the time of Darius, the text of Cyrus's memorandum was found in the royal archives of Ecbatana, and it is quoted cited in the following words:

In the first year of Cyrus the king, King Cyrus decreed: Temple of God in Jerusalem. The Temple will be rebuilt as a place at which sacrifices are offered and to which offerings are brought to be burnt. Its height is to be sixty cubits, its width sixty cubits. There are to be three thicknesses of stone blocks and one of wood. The expense is to be met by the king's household. Furthermore, the vessels of gold and silver from the Temple of God which Nebuchadnezzar took from the sanctuary in Jerusalem and brought to Babylon are to be restored so that everything may be restored to the sanctuary in Jerusalem and be put back in the Temple of God. (Ezra 6:2-5)

Doubts persist about the authenticity of these quotations. They certainly do not show formal legal precision. It is also true that the Chronicler was interested entirely in stressing the preferential benevolence Cyrus showed toward the Jews. It is obvious as well that he has collapsed events that took place over a longer period than is indicated. In particular, it is possible that many of the events dated by the Chronicler to the beginning of the reign of Cyrus actually took place during the reign of Cambyses or even later. In sum, while the measures ascribed to Cyrus appear legitimate as a whole, contradictions and uncertainties regarding certain details of the royal decrees and their exact chronology still remain.

According to the editor of the book of Ezra, a first contingent left Babylonia under the joint leadership of two exalted personages, Sheshbazzar and Zerubbabel. Much remains obscure about their origins and their functional relationship. One of them, Sheshbazzar, who has the poorly understood title 'prince' (*tiršata*), may have been a descendant of the illustrious line of David. As for Zerubbabel, it is not absolutely certain that he was even in the first returning caravan. Upon their arrival in Jerusalem, the Jews set about restoring worship. They raised an altar on the old foundations to offer sacrifices, and they began again to honor the traditional festivals. However, this initial restoration remained fragile. A relatively small number of Jews had taken the road to Judah (some 50,000 according to the calculations of the Chronicler). The country had been considerably impoverished since the defeats by the Babylonians, and opposition to the restoration of the Temple arose among the neighbors, so that the work of reconstruction did not really commence during the reign of Cyrus. The Jews proceeded nonetheless with the official "foundation" ceremonies—that is, with the laying of the cornerstone, an act that connoted politico-religious symbolism more than actual construction work. The ancient monarchic institutions were obviously not restored by Cyrus. It appears rather that Judah became a province (*medinah*) controlled by a governor (*pehā*) appointed by the Great King from among the Jews themselves—namely, Sheshbazzar.

One gets the impression from reading the Jewish texts that the favors and privileges granted by Cyrus were exceptional compared with normal relations between a Near Eastern sovereign and an ethnoreligious community. Along with the Babylonized Cyrus of the *Cylinder*, this portrayal has played no small part in creating an image of the Achaemenid conqueror as a pacific and tolerant king, making a final break with the "barbarous and cruel" practices of the Assyro-Babylonians. Even today, Cyrus is presented by his modern acolytes as the inventor of "human rights." Some have gone so far as to consider the demeanor of Cyrus to be that of a devotee of a religion, Zoroastrianism, that by its rejection of idols actually resembles the religion of the Judeo-Israelites, and that these Achaemenid-Jewish connections were part of a much broader reform of the "polytheistic chaos."

In truth, the issue was never posed in these terms either for Cyrus or even for the Jewish leaders. Because religion and politics were closely linked in ancient Near Eastern society, it is reasonable that the Jewish sources present History in religious terms. But any "religious" decision also had political implications and objectives. Since any city or people had protective deities, it was normal for them to dedicate a cult to these deities and to build sanctuaries for them that constituted both cult places and symbols of an independent or autonomous political entity. It is no less understandable that a conqueror would carry off the gods (that is, the cult statues and objects) along with the royal family

and the political and military elites, thus dashing all hope of future revolt against his dominion. This is exactly what Nebuchadnezzar did after the capture of Jerusalem. Conversely, the political and religious restoration of a city or community was accompanied by the return—absolutely essential to the repatriated people—of the statues of the gods that had previously been deported to the former conqueror's capital. It was exactly this that Cyrus did in Babylon. The “exceptional” character of the actions taken by Cyrus on behalf of Jerusalem thus arises only from the narrowly Judeocentric perspective of our sources. Resituated in the ideological and political context of the Near East, they again become what they had been originally: certainly an important episode for the Jews themselves, but a banal and typical event that many Near Eastern peoples would already have experienced in the course of Assyrian and Babylonian dominion.

Cyrus and the Trans-Euphrates

If we deny the existence of special relationships between Cyrus and the Jewish leaders in Babylonia, how are we to interpret his directives? We are reduced to hypothesizing. Let us recall that, according to Herodotus (I.153), Egypt took the side of the enemies who feared Cyrus when he left the Lydian front in 546. For such reasons as this it is generally recognized that the creation of a province of Jerusalem entirely faithful to Persian interests took place in a wider strategic context, with the ultimate goal, sooner or later, of conquering Egypt. But we are very poorly informed about Cyrus's policy in the regions beyond the Euphrates. A passage of the *Cylinder* contains, at first sight, a record of the territorial ambitions of the new master of Babylon. After narrating his entry into Babylon and recalling Marduk's blessing of Cyrus, Cambyses, and the entire Persian army, the text states: “All the kings of the entire world from the Upper [Mediterranean] Sea to the Lower Sea [Persian Gulf], those who are seated in throne rooms, all the kings of Amurru living in tents, brought their heavy tribute and kissed my feet in Babylon.” These “kings of Amurru” are probably the kings of the Arab populations of the northern Arabian Peninsula, traditionally called “Scenites” by the Greek authors, that is, those “who live in tents.” But the expression used by the compiler of the *Cylinder* is too conventional to allow firm conclusions regarding the degree of these peoples' subjugation.

In his desire to make Cyrus the creator of the empire at its greatest extent, Xenophon assigns Cyrus numerous conquests in these regions. According to him (*Cyr.* I.1.4; VII.4.16), Cyrus subjugated the Arabs and placed a satrap over them (VIII.6.16). Cyprus surrendered voluntarily and sent contingents to the Great King after the conquest of Babylon (VIII.6.8); still according to Xenophon (VIII.8.1), Cyprus and Egypt represented the western edge of Cyrus's empire. It is indeed to Cyrus himself that Xenophon attributes the military expeditions that resulted in the conquest of Egypt (VIII, VIII.6.20). But Xenophon's information is hardly acceptable. Cyrus certainly did not lead a campaign against the Arabs of Arabia; he merely subjugated the “Arab” populations living in Mesopotamia. Just as certainly, he was not the one who conquered Egypt. As for Cyprus, far from having been conquered by the Persians, it seems on the contrary to have been a tributary of Pharaoh Amasis in 539. Nor do we know anything of the situation of in the Phoenician cities at this date. Ezra (3:7) states that, after the return of the Judahites, “to the Sidonians and Tyrians they gave food, drink and oil, so that they would bring cedar wood from Lebanon by sea to Jaffa, for which Cyrus king of Persia had given permission.” But, even if such a decision had been made, it does not necessarily imply that political submission of the Phoenician cities to the new Persian power

had already been secured. Even if the Phoenicians were subject to the Persians, we know nothing of the concrete forms Persian dominion took. The decisive actions more likely date to the reign of Cambyses, as a remark of Herodotus implies (II.19),

In reality, the only verifiable act of Cyrus was the creation of an immense satrapal administration uniting Babylonia and the countries of Ebir Nāri (literally, 'across the River', that is, Trans-Euphrates) four years after the capture of Babylon. In Herodotus's day, Trans-Euphrates extended "from the town of Posideium [Ras-el Bassit] . . . as far as Egypt. . . . This province (*nomos*) contains the whole of Phoenicia and that part of Syria which is called Palestine, and Cyprus" III.91◊). But it must be added that, before Cambyses, we know practically nothing of the conditions in the countries of Ebir Nāri and their relations with the Achaemenid authorities. It is possible that the province of Judah was not created until the time of Cambyses, since it seems clear that its governor received his instructions from the satrap of Babylonia via his subordinate in Trans-Euphrates.

Cyrus and Egypt

Did Pharaoh Amasis make contact with Cyrus after the capture of Babylon? We know nothing about this, apart from some contradictory information reported by Herodotus (III.1◊) and repeated by later authors. To explain to his readers the reasons for Cambyses' invasion of Egypt, Herodotus highlights a matrimonial squabble that arose between the courts of Persia and Amasis. He provides the Persian version (III.1) and the version heard from the Egyptians (III.2-3), whose truthfulness he questions. Cyrus supposedly asked Amasis to send him the finest Egyptian oculist. At the urging of this specialist, Cambyses (Persian version) or Cyrus (Egyptian version) supposedly demanded that Amasis send one of his daughters to the Persian court. In the Persian version, she was to marry Cambyses; the Egyptians claimed that she was married to Cyrus and that Cambyses was born of this union. In yet another version, the young Cambyses supposedly swore to avenge his mother Cassandane, who had been humiliated by seeing Cyrus replace her with the Egyptian girl. The only point of agreement among all the versions collected by Herodotus is that Amasis deliberately tricked the Persian king: instead of his own daughter, he supposedly sent Nitetis, the daughter of the previous pharaoh, Apries. That Amasis hoodwinked him in this fashion infuriated Cambyses. To all appearances, this tradition seems to reflect later Persian propaganda, and the historian would do well not to take it into consideration.

7. From Cyrus to Cambyses

If, as seems likely, an Egyptian campaign was in the planning stages, Cyrus ended up unable to lead it himself. The last ten years of his reign are poorly known. All we know is that in 530 the king launched an expedition against the Massagetae of Central Asia. We have no certain evidence regarding the causes and the stages of the military operations, and even the circumstances of the death of Cyrus were very quickly surrounded with a halo of legend, so forcefully did the conflict between the glorious conqueror and Queen Tomyris strike people's imagination. This new expedition in Central Asia attests at least to the difficulties faced by Persian power in maintaining its dominion there.

Before departing, Cyrus took steps to ensure the succession. He sent back to Persia his oldest son Cambyses, "whom he had named as his successor." This note from Herodotus (I.208◊) is confirmed by a passage in Ctesias (*Persica*, §8). In a fictionalized

context, Xenophon (*Cyr.* VIII.7.6–28) gives his version of the death of Cyrus in Persia and records the last words of the dying king in the presence of his two sons, the elder Cambyses and the younger Tanaoxares. This Tanaoxares (Ctesias has Tanyoxarces) is the person called Bardiya in the Behistun inscription and several Babylonian documents and called Smerdis by Herodotus. Cyrus then supposedly proceeded to divide duties and powers. Cambyses was made heir. As for Bardiya, he received an immense territory in Central Asia, to which was attached the privilege of not passing on tribute collected in the district to the central authority—a sort of grant, as it were, intended to soothe the anticipated resentment of the one who had not been awarded supreme power. After the death of Cyrus in Central Asia, Cambyses succeeded him with no evident difficulty, and he had his father's body transported to Pasargadae for burial in the tomb that he had prepared beforehand (cf. Ctesias §8).

Apart from scattered information in Babylonian tablets, the reign of the new Great King is known only from the story given by Herodotus about Cambyses' campaign in Egypt between 525 and 522, after which he died in Syria. In Herodotus and among the Classical authors in general, the figure of Cambyses is burdened with strongly negative judgments. The primary reason is that he is strongly contrasted with "good king Cyrus." This is certainly the case for Xenophon, who writes: "As soon as Cyrus was dead, his children at once fell into dissension, states and nations began to revolt, and everything began to deteriorate" (*Cyr.* VIII, 8.2♦). A long passage follows in which Xenophon illustrates his favorite thesis of "Persian decadence." The same version is found in Plato (*Laws*, III.693ff.), in whose eyes the perfect balance achieved under Cyrus deteriorated rapidly with Cambyses. He finds the reason for this in the effete education of the son of the founder of the empire. As proof of this "decadence," he refers to the revolt of Bardiya against Cambyses. It is unnecessary to dwell further on the polemical aspect of these analyses, which are built on a conventional view of the supposed relationship between the wealth of kings and their military incompetence.

For his part and following his Persian sources, Herodotus (III.89♦) also contrasts Cyrus with his successors: "The Persians have a saying that Darius was a tradesman, Cambyses a tyrant, and Cyrus a father." In the course of the story of the Egyptian campaign, Herodotus returns several times to the topic. He repeats the opinion of the Egyptians, according to whom "Cambyses went mad, but even before this he had been far from sound in his mind. . . . They say that from birth Cambyses suffered from a serious illness, which some call the sacred sickness" (III.30.33♦). In support of his reports, Herodotus describes in detail the "heinous crimes" perpetrated by the king both against the Egyptians and against well-born Persians, including his sister-wife. And Herodotus concludes: "In view of all this, I have no doubt whatever that Cambyses was completely out of his mind" (III.38♦). It is clear that here Herodotus was depending closely on the oral sources he used in his reconstruction of the Egyptian campaign and the bloody succession to Cambyses. It is thus important to place his judgments in historical context, so as to gain the necessary perspective and thus to award Cambyses proper credit for his part in the construction of the Achaemenid Empire.

8. *The Egyptian Campaign (525–522)*

The Egypt of Amasis

Herodotus (III.1–2), as we have seen, explains Cambyses' decision to march against Egypt by reasons that will scarcely satisfy the historian, for the interpretations he pro-

vides of an Egyptian–Persian dynastic marriage at the time of Cyrus primarily reflect the viewpoint of Persian propaganda. Instead, an examination of the general strategic situation can allow us to understand the conditions that led Cambyses to start so important a military campaign.

Having become master of Cyrus's empire, Cambyses had both to maintain dominion over the conquered countries and to extend the conquest toward the only remaining power of consequence in the Near East, the Egyptian kingdom. This must not be seen as a more or less irrational and uncontrollable desire to take over the entire inhabited world. Cambyses' strategy was instead predetermined by the decision made by his father to annex Trans-Euphrates to Babylonia. This would sooner or later require the subjugation of the countries located between the Euphrates and the Nile and thus necessitated conflict with Egypt, which in the past, and quite recently as well, had exhibited ambitions in this region.

The Egyptian campaign proper was thus certainly preceded by a series of conquests. Our ignorance in these areas is profound. We know in any case that Phoenicia and Cyprus were dependencies of Cambyses in 525. We know neither when nor how the conquest took place. According to Herodotus (III.19♦), "the Phoenicians had taken service under him of their own free will. . . . The Cyprians, too, had given their services to Persia." Both were included in the naval forces mustered by Cambyses for his campaign against Egypt. The conquest of Cyprus was a heavy blow to Pharaoh Amasis because, according to Herodotus (II.182♦), this king "was also the first man to take Cyprus and compel it to pay tribute."

Since 664, Egypt had been governed by the Saite dynasty, whose first members accomplished the difficult task of reuniting the country. Traditionally included in the "Late Period" by Egyptologists, the Saite period seems to have been a true renaissance for Egypt. Since 570, Egypt had been ruled by Amasis, who died in 526. According to Herodotus, "it is said that the reign of Amasis was a time of unexampled material prosperity for Egypt; the earth gave its riches to the people as the river gave its riches to the earth. The total number of inhabited towns at this period was twenty thousand" (II.177♦). Amasis also had powerful armed forces: a fleet that his predecessor, Necho II (610–595), had left him and an army considerably reinforced by contingents of mercenaries from all over the Near East, including Caria and Ionia.

Despite the assets he enjoyed, it can hardly be doubted that Amasis considered Cyrus's conquest of Babylonia a serious danger. He actively pursued a policy aimed at gaining allies for the struggle with the Persians, which was bound to break out in a short time. The Saite pharaohs had long since been fostering relations with numerous Greek states in Europe and Asia Minor. Herodotus (II.178) labels Amasis a "Philhellene." Among the proofs of his philhellenism, he cites the case of Naucratis, a trading post in the Delta established by cities of Asia Minor with the assent of the pharaoh, doubtless during the reign of Psammetichus I. This trade profited not only the Greeks and the Phoenicians (also represented in Egypt), but also the pharaoh, for Amasis maintained strict controls over imports and exports. Customs houses had been erected in the east of the Delta at the Pelusiac mouth and in the west, on the Canopic branch. Taxes were levied there on goods coming from the "northern foreign countries" (Phoenicia, Syria–Palestine) and "foreign countries of the Great Green" (Aegean, i.e., Greek countries), respectively.

Numerous Greek sanctuaries received offerings from the pharaoh: the temple of Delphi and, in Asia Minor, the temple of Athena at Lindos on Rhodes, the temple of Hera

at Samos, and the temple of the Branchidae at Didyma, as well as the sanctuary of Athena at Cyrene. The interest of the Saite kings in the cities of Asia Minor was long-standing: traditionally, it was from these cities that they recruited auxiliary troops, who were granted land in Egypt, to reinforce the Egyptian army. According to Herodotus (II.163), Carians and Ionians under the command of Apries numbered 30,000 when he was defeated by Amasis. The author from Halicarnassus also states (II.154♦) that Amasis settled the Ionians and Carians in Memphis “to protect him from his own people.” In spite of the discontent provoked in the Egyptian soldiers by these favors granted to the soldiers from Asia Minor, Amasis was following the policy of his predecessors.

Amasis could count among his allies Polycrates, who had established a tyranny on the island of Samos after a coup d’etat. “Once master of it, he concluded a pact of friendship with Amasis, king of Egypt, sealing it by a mutual exchange of presents,” writes Herodotus (III.39♦). It was to strengthen this alliance, established with an exchange gifts, that Amasis dedicated “two likenesses of himself, in wood” in the Heraion of Samos (II.182♦). Herodotus emphasizes the power that Polycrates soon acquired: “It was not long before the rapid increase of his power became the talk of Ionia and the rest of Greece. All his campaigns were victorious, his every venture a success.”♦ He extended his power as far as the Cyclades, including Rheneae, near Delos. He soon represented a real threat to the Persian dominion over the Greek cities on the coast of Asia Minor after Cyrus. This is what Herodotus indicates, noting that Polycrates achieved a naval victory over the Mytilenians of Lesbos, allies of Miletus: but Miletus was a subject of the Persians. The raids launched by the tyrant against the islands and the mainland towns imperiled the Achaemenid positions. Herodotus himself emphatically notes that, in his opinion, Polycrates “had high hopes of making himself master of Ionia and the islands” (III.122♦). These were perhaps the circumstances in which Cyrus made Oroetes “governor of Sardis.” Without doubt, Oroetes’ main assignment was the defense of Achaemenid territories against the actions of the tyrant. In relation to the Persians, Polycrates to some extent played the same role as Croesus when he entered into alliance with the Egyptian pharaoh.

In discussing the concerns of Oroetes, Herodotus writes of Polycrates that he “was the first Greek we know of to plan the dominion of the sea” (III.122♦). He was able to nurture these ambitions thanks to his naval power. According to Herodotus (III.39♦), he had 100 penteconters (fifty-oared galleys). This was a naval force beyond the means of a Greek city, even one as rich as Samos. It is thus not out of the question that it was partially as a result of the aid of Amasis that Polycrates was able to build and maintain such a naval force. According to Herodotus (III.44), in 525 Polycrates even had 40 triremes (galley with three banks of oars). The trireme was a great technological and military innovation that appeared in the Aegean world between 550 and 525. This may be the type of warship that Egypt had as well; it enabled Amasis to take Cyprus.

The Conquest of the Nile Valley and Its Approaches

In 525, however, Egypt’s situation had recently taken a turn for the worse. First of all, Amasis had died the year before; he was succeeded by his son Psammetichus III. The loss of Amasis, which occurred when Cambyses was preparing to march against Egypt, had serious consequences. In a long account in the form of a story, Herodotus describes the break between Amasis and Polycrates (III.40–43). According to Herodotus, the treaty

of friendship was abrogated on the initiative of Amasis, who was uneasy about the prosperity and unbridled ambition of Polycrates. In reality, Polycrates had himself established contact with Cambyses, who had urged him to send him a squadron of ships. Polycrates dispatched a force of 40 triremes, which he was careful to man with “carefully selected crews, every man of which he had particular reason to suspect of disloyalty to himself . . . with instructions to Cambyses never to allow them to return to Samos.”♦ The episode poses several difficulties of interpretation, but the essence is clear: Polycrates forsook the Egyptian alliance and made overtures to the Persian king. No doubt he was uneasy about the dangers mounting against him (Sparta was preparing to send a fleet against Samos) and about the increasing opposition of a faction of the Samian elites who favored cooperation with Egypt. The tyrant’s sudden shift of strategy can be understood even better if we assume that it happened after the death of Amasis. Well informed about Cambyses’ preparations, he had decided to seek safety in what he judged to be an inevitable Persian victory.

The pharaoh suffered another defection, that of Phanes of Halicarnassus, “a brave and intelligent soldier,” in the words of his compatriot Herodotus (III.4♦). He was one of the officers of the Carian troops serving close to the pharaoh, who harbored a strong fear of him, “as he was a person of consequence in the army and had very precise knowledge of the internal condition of Egypt.” Escaping the vigilance of the men sent in pursuit of him, Phanes reached Cambyses when he “was anxious to launch his attack on Egypt.” He was able to provide the Great King with firsthand information on both the state of Egyptian forces and access routes to the Delta.

Meanwhile, Cambyses had made considerable military preparations. Herodotus notes that, after the conquest of Asia Minor by Cyrus’s troops, “the islanders had nothing to fear, because the Phoenicians were not yet subject to Persia and Persia herself was not a sea power” (I.143♦). The subjugation of Cyprus and Phoenicia allowed Cambyses to shift the course of things. In 525, the Phoenicians “were entirely dependent on the strength of their navy (*nautikos stratos*).” This force also included Cypriots, as well as Greeks from Ionia and Aeolis, including a contingent from Mytilene. We may say that Cambyses was the real creator of the Persian Navy, which was built with men and materials levied from both Phoenicia and Asia Minor. This was the compliment that the Persians of Cambyses’ entourage paid him when he asked them about his accomplishments: “They had answered that he was better than his father, because he had kept all Cyrus’ possession and acquired Egypt and the command of the sea into the bargain” (III.34♦). It does in fact seem that Cambyses created the royal Persian navy in its entirety, and it was indispensable to his hopes of victorious engagement with the pharaoh, who had an imposing fleet of his own.

The military operations are not known in great detail. While telling the story of Phanes, Herodotus dwells at length (III.4–9) on the relations established by Cambyses with the “king of the Arabs,” who controlled the desert region between Gaza and the Egyptian border. A formal treaty permitted the Persian king access to enough water to reach the Nile Valley. It was certainly this approach route that allowed Cambyses to impose his direct rule over Trans-Euphratian peoples and cities who before then had surely never seen a Persian soldier. This is the state of affairs that Polybius (XVI.22a) later reports, praising the fidelity of the inhabitants of Gaza to their allies: “When the Persians invaded, for example, when elsewhere all were terrified by the power of the adversary,

when all to the last man surrendered to the adversary, they confronted the danger on their own and together withstood the siege." Gaza was an important commercial center—whose prosperity Herodotus compares to that of Sardis—and from that time onward it constituted an essential support for the Persian occupation of Palestine and a bridgehead for any expedition to Egypt.

Psammetichus headed an army comprising Egyptian soldiers and Carian and Greek auxiliaries and was positioned at the Pelusiac mouth of the Nile, where he awaited Cambyses. But Herodotus gives hardly any information about the fighting, being more interested in the terrible vengeance prepared by the pharaoh's Carian and Greek auxiliaries against Phanes (III.11) and in a picturesque comparison of the relative toughness of Egyptian skulls versus Persian skulls (III.12). He mentions simply that the battle ended badly for Psammetichus, whose Egyptian troops sought refuge in the citadel of Memphis. "Cambyses laid siege to the town, and after a time it was surrendered" (III.13♦). Psammetichus was taken prisoner.

The choices made by Herodotus from the information available to him led him to pass over in silence both the strength of the resistance and the role of Psammetichus's navy. A late author, Polyaeus (VII.9), instead emphasizes that Cambyses had to besiege Pelusium and that the Egyptians were able to use catapults and other machines to block Cambyses in front of the town, which ipso facto closed off his entry to Egypt, since Egypt could not be entered without taking the town or having naval superiority. We know that an Egyptian, Udjahorresnet, commanded the sea-going fleet for Amasis and then for Psammetichus III. Because he presents himself as a favorite of Cambyses, we might guess that Udjahorresnet had abandoned Amasis, thus considerably facilitating Cambyses' victory at Pelusium; but the hypothesis remains weak. Once Pelusium was taken, the troops and the Persian navy were able to penetrate the Nile Valley and lay siege to Memphis, which was linked to the sea by various waterways. One of these was traversed by Cambyses' boat, which carried a herald instructed to demand the surrender of the defenders. The herald was killed, along with his retinue. Psammetichus and his troops were in fact able to mount a long resistance in the shadow of the "White Wall," which could not be taken without the support of the fleet. At the end of the siege (whose length Herodotus does not give), Cambyses was able to make his triumphal entry into the town, and a Persian-Egyptian garrison was stationed in the "White Wall."

Once he had conquered Egypt, Cambyses intended to reassert on his own behalf the ambitions of the last pharaohs toward the west (Libya and Cyrenaica) and south (Nubia = Herodotus's Ethiopia). The Libyans, soon followed by the Greeks of Cyrene and Barca, sent gifts to Cambyses as tokens of surrender; as proof of his good will, Cambyses returned the Greek woman whom Amasis had wed when he made an alliance with the Greek town of Cyrene. Then, still following Herodotus (III.17), "he planned a threefold expedition: against the Carthaginians, against the Ammonians, against the Long-Lived Ethiopians who live in Libya on the edge of the southern sea." The expedition against Carthage was canceled because the Phoenicians were unwilling to make war on a Phoenician colony. Although the possibility of an expedition against Carthage seems unlikely, the same cannot be said for royal designs on the south. Cambyses dedicated his efforts to the realization of a great "African project," which consisted in part of acquiring the kingdom of Meroë and in part of seizing strategic positions in the western oases. In this strategy, Cambyses was clearly following the policy of the Saïtes, who since Psam-

metichus I had regularly sent expeditions to the south in order to put an end to the Cushite threat and to solidify their dominion at least as far as the First Cataract. A garrison was established at Elephantine. The garrison, already consisting partly of Jewish contingents, was there throughout the time of Cambyses, as we know because, in their petition dating to the reign of Darius II, the Jews recalled that their sanctuary had been built "in the days of the kings of Egypt" and was standing "when Cambyses came into Egypt," and they implied that Cambyses protected it (DAE 102 [AP 30–31 ♦]).

According to Herodotus, the expeditions, one against the oasis of Ammon, the other against Ethiopia, were repaid with utter disaster. Herodotus blames the "madness" of Cambyses, who "at once began his march against Ethiopia, without any orders for the provision of supplies, and without for a moment considering the fact that he was to take his men to the ends of the earth" (III.26 ♦). But the deliberate bias against Cambyses raises doubts about the accuracy of Herodotus's version. Other evidence indicates that the expedition did not founder in a military catastrophe, even if the difficulties of the undertaking perhaps obliged the Great King to retreat. Specific evidence of this are the latest results of excavations on the site of the fortress of Dorginarti, established in the Saite period at the same latitude as the Second Cataract. The pottery and an Aramaic text show that the fortress, which was doubtless part of an extended network, remained in use throughout the Achaemenid period.

9. *Cambyses and the Egyptian Traditions*

The "Madness" of Cambyses: Sources and Problems

According to Herodotus, up to this time, Cambyses behaved with a certain moderation. He even "felt a touch of pity" and ordered that the son of Psammetichus be spared (III.14 ♦). On the other hand, in the eyes of the same Herodotus, the king "lost his wits completely and, like the madman he was," launched his expedition against the Ethiopians (III.25 ♦). Madness completely possessed the spirit of the king after his return to Memphis. He was seized with fury toward the gods, the cults, the temples, and the priests of Egypt. Herodotus lays particular stress on the murder of the sacred bull Apis and his caretakers. He thinks that Cambyses considered the feasts held in honor of Apis to be celebrations saluting his Ethiopian (Nubian) defeat:

Cambyses ordered the priests to be whipped by the men whose business it was to carry out such punishments, and any Egyptian who was found still keeping holiday to be put to death. In this way the festival was broken up, the priests punished, and Apis, who lay in the temple for a time wasting away from the wound in his thigh, finally died and was buried by the priests without the knowledge of Cambyses. Even before this Cambyses had been far from sound in his mind; but the Egyptians are convinced that the complete loss of his reason was the direct result of this crime. (III.29 ♦)

There follows the tale of his "murderous madness" against highly placed Persians, against his brother Smerdis (III.30), his sister-wife (III.31–33), and against the Lydian Croesus (III.36–37). Then Herodotus brings grave accusations against the king who "broke open ancient tombs and examined the bodies, and even entered the temple of Hephaestus [Ptah] and jeered at the god's statue" (III.37 ♦). And Herodotus concludes: "In view of all this, I have no doubt whatever that Cambyses was completely out of his mind; it is the only possible explanation of his assault upon, and mockery of, everything which ancient law and custom have made sacred in Egypt" (III.38 ♦).

Following Herodotus, all of the Classical authors repeat the theme of the madness and impiety of Cambyses. "Shocked by Egyptian religious practices, he had the temples of Apis and other gods demolished," writes Justin (I.9.2). Strabo offers the same explanations to explain the destruction of the temples of Heliopolis and Thebes (XVII.1.27, 46). This hostile tradition is also found in Diodorus Siculus (I.46.4♦; 49.5♦):

The silver and gold and costly works of ivory and rare stone [that the temples of Thebes contained] were carried off by the Persians when Cambyses burned the temples of Egypt; and it was at this time, they say, that the Persians, by transferring all this wealth to Asia and taking artisans along from Egypt, constructed their famous palaces in Persepolis and Susa and throughout Media. . . . [The circle of gold crowning the tomb of Ozymandias], they said, had been plundered by Cambyses and the Persians when he conquered Egypt.

A late tradition recorded by St. Jerome (*Comm. Dan.* I.7.9) even suggests that Cambyses deported 2500 Egyptian cult images. In short, Cambyses, we are led to believe, is supposed to have done everything he possibly could to alienate the Egyptian population as a whole, especially the great families who administered the temples, whose leading position in Egyptian society he certainly could not have been unaware of. Nor could he have been unaware of the role played by the pharaoh or the crown prince in the funeral rites that were intended to mark the earthly death of an Apis. We know for example that Psammetichus III, shortly before Cambyses' invasion, had himself gone through the especially trying ritual fast (total lack of nourishment for four days, and exclusively vegetarian diet for seventy days) and that he had participated in the exhausting ceremonies that played out over the seventy days it took to embalm the sacred bull. Lastly, Cambyses could not have been unaware of the enormous popularity of Apis among the common folk of Egypt, who joined in the mourning. These people made up the towns and nomes of the provinces who, on the demand of the authorities in Memphis, furnished the enormous quantities of materials needed for the mummification of the sacred animal (silver, gold, royal linen, myrrh, precious stones, and all sorts of "good things"). Even less could Cambyses have been unaware that, at the time of his return to Memphis, ceremonies marking the "revelation" of Apis were to be going on, which, according to Herodotus (III.27♦), were celebrated by Egyptians wearing "their best clothes." In conclusion, in the version presented by Herodotus, Cambyses' Egyptian policy (which he contrasts with that of Darius; III.38) shows a strong break with the policy of his father, Cyrus, in conquered countries. Unable to offer a political explanation, Herodotus had no option but to resort to the "madness" of the king (III.38). But modern historians are obliged to show much greater rigor.

Some of the deeds ascribed to the Persians cannot be denied, but they do not necessarily carry the significance that the ancient authors attribute to them. A man as favorable toward the new master as the Egyptian Udjahorresnet (who will be discussed at greater length shortly) himself speaks of the "trouble that arose in this nome [of Sais], when the very great trouble arose in the entire land [of Egypt]." And exalting his good deeds, he writes: "I saved its [my city of Sais's] inhabitants from the very great trouble that arose in the entire land [of Egypt], the likes of which had never existed in this world." This trouble coincides with the settlement of the "foreigners" in Egypt, which led to a temporary state of anarchy. The disorders were not limited to the Delta, since the destruction of Egyptian temples is also recorded on the southern frontier, at Elephantine. We can imagine that many other instances of outrage against both goods and

persons were perpetrated by the troops. But it would be an error to see this as the manifestation of an anti-Egyptian policy laid down and enforced by Cambyses; it was simply the prerogative of the victors. Let us note also that sending Egyptian treasures (including the wealth of certain temples) to Persia was nothing out of the ordinary. It was exactly what Cyrus had done at Ecbatana and Sardis.

Moreover, the tradition of the murder of the Apis by Cambyses must be completely reinterpreted in light of discoveries made at the Serapeum of Memphis, where the deceased and embalmed Apises were laid to rest in sarcophagi. The epitaph of the Apis interred at the time of Cambyses, in 524, has actually been found. The king, garbed as an Egyptian and on his knees, is there called "the Horus [. . .], king of Upper and Lower Egypt [. . .]," and the inscription says:

[Year] 6, third month of the season Shemou, day 10 (?), under the Majesty of the king of Upper and Lower Egypt [. . .] endowed with eternal life, the god was brought in [peace toward the good West and laid to rest in the necropolis in] his [place] which is the place which his Majesty had made for him, [after] all [the ceremonies had been done for him] in the embalming hall [. . .]. It was done according to everything his Majesty had said [. . .]. (Posener no. 3)

The inscription on the sarcophagus is equally eloquent on the role Cambyses played in the events:

[Cambyses], the king of Upper and Lower Egypt . . . made as his monument to his father Apis-Osiris a large sarcophagus of granite, dedicated by the king [. . .], endowed with all life, with all perpetuity and prosperity (?), with all health, with all joy, appearing eternally as king of Upper and Lower Egypt. (Posener no. 4)

The conclusion seems undeniable: Herodotus recorded spurious information. Far from having killed the young Apis, Cambyses participated in the embalming and funeral rites of an Apis, following the regulations and the ceremony that were well known, particularly in the Saite period. The inscriptions also make it clear that it was in his capacity as "king of Upper and Lower Egypt," as "son of Rā" — in short, as pharaoh — that Cambyses led the funeral ceremonies. From this emerges an image of Cambyses quite different from that which Herodotus wished to convey. Cambyses was a conqueror seeking to take his place and his rank in the rites and rituals of the Egyptians; he was an Achaemenid king who wished to comply, as pharaoh, with the practices and beliefs that had become inscribed in the Egyptian *longue durée*. Confirmation of this wish is found in the inscription on the Egyptian seal of the new pharaoh:

The king of Upper and Lower Egypt, Cambyses, beloved of [the goddess] Wajet, sovereign of [the town of] Inet, great, Eye of the Sun, sovereign of the Sky, mistress of the gods, to whom is given life, as to the Sun.

Udjahorresnet and Cambyses

Conclusions of the same kind can be drawn from the analysis of another, even better-known hieroglyphic text, namely, the inscriptions on a statuette that shows Udjahorresnet, whom we have already met, carrying a small, portable shrine (fig. 44, p. 473). This statue and its inscriptions, probably erected in the temple of Osiris at Saïs, were intended to ensure divine benevolence in the hereafter for the person represented, as is shown by the final appeal to the gods, who were asked to "recall all the meritorious deeds" of the dedicator. They were also intended to preserve his memory and his acts for

future generations of pilgrims. Needless to say, the autobiographical character of the texts invites the historian to submit the texts to a critical reading.

Udjahorresnet presents himself as a benefactor: he restored the splendor of the temple of Neith at Saïs, he was “a good man” in the good town of Saïs, he “defended the weak against the powerful,” he was “a good son and a good brother, filling those near to him with favors and privileges.” On the other hand, he is much more discreet about the manner in which he passed from the service of Amasis and Psammetichus III to the service of Cambyses and then Darius. However it may have happened, there is no doubt that he turned to the new power. In detailing, with a touch of vanity, the titles bestowed on him by Amasis, Psammetichus, Cambyses, and Darius, he presents himself as a man very close to all of the kings, both Saite and Persian: “I was a (man) honored by all his masters. . . . They gave me gold ornaments and made for me all useful things” (Posener no. 1F). Udjahorresnet, a figure of the transition, was firmly devoted to situating his career and his actions in the service of purely Egyptian dynastic and ideological continuity.

It is true that Udjahorresnet, as we have seen, alludes directly to the Persian invasion that caused “great trouble,” not only in Saïs but in all of Egypt. This reference permits him first and foremost to emphasize the relief he himself had brought to the temple of Neith, to his family, and more generally to the inhabitants of the Saite nome. However, it is also in this context that he established a special relationship with Cambyses. He had come before the king to complain about the presence of Achaemenid soldiers (the “foreigners”) within the precinct of the sanctuary of Neith. The king ordered the evacuation of the troops and the purification of the temple. Throughout the text, Cambyses is presented as the restorer of order: expressions such as “as it was before,” “as any king would do,” “as any beneficent king would do,” or “as any previous king would do” are used in regard to him several times. Cambyses “restored” landed estates to the goddess Neith; in the sanctuary he “replaced” people expelled by the soldiers. . . . In this way, Udjahorresnet absolves the king of all responsibility for the extortions that were committed. Cambyses is added to the long series of “beneficent kings” who took care of the temples and cults. He went in person to Saïs, prostrated himself before the goddess, and presented his offerings, “as any beneficent king would do.” He “established the presentation of libations to the lord of Eternity (Osiris) within the temple of Neith, as any previous king would do.”

Cambyses, the conqueror of Egypt, is thus clearly presented by Udjahorresnet as a pharaoh, in the full sense of the term. The Egyptian consistently names the Persian king “king of Upper and Lower Egypt”—a title he also bears in the inscriptions of the Serapeum. In reality, after the victory Cambyses played a sort of double role. He was “the great king of the foreign countries” who came to Egypt with “the foreigners of all the foreign countries.” But, “as soon as he took possession of this entire land [. . .], he was great sovereign of Egypt, great king of all the foreign countries.” Through his titlature and his privileged relationship with the gods, Cambyses acquired in the eyes of Udjahorresnet the status of pharaoh, which clothed him with all of the attributes and endowed him with all of the traditional virtues. Thus, ideological bases were put in place on which the collaboration between Cambyses (later Darius) and Udjahorresnet was founded. From this point of view, the Egyptian’s statements are not inconsistent with the *Cyrus Cylinder*: in the same way that Cyrus was Babylonized, Cambyses in Egypt was Egyptianized by the Egyptians who wished to collaborate with the new power. For both of them it was the

best way to present the image of a solicitous conqueror, graciously bending to the politico-religious traditions of the conquered countries. It was, in a way, acquiescing to Babylonian and Egyptian continuity in order to highlight the Achaemenid discontinuity.

There can be no doubt that this policy was defined by Cambyses himself. Udjahorresnet even states that it was on the orders of the sovereign that he composed his titulature, namely "king of Upper and Lower Egypt." But it seems likely that Persian propaganda must have taken extra pains to justify the power of Cambyses in Egypt. Among the "impious" crimes perpetrated by Cambyses at Saïs, Herodotus (III.16♦) lists the violation of the sepulchre of Amasis: "He gave orders for his body to be taken from the tomb where it lay. This done, he proceeded to have it treated with every possible indignity, such as lashing with whips, pricking with goads, and the plucking of its hairs. . . . Cambyses ordered it to be burnt. This was a wicked thing to do. . . ." A priori, this behavior seems absolutely contrary to the express intention of Cambyses to act as the successor of the legitimate pharaohs. But other acts and accounts also tell of his desire to be linked directly with Pharaoh Hophra (Apries), whom Amasis had deposed in order to seize power. This is also the sense of one of the accounts of Cambyses that describes him as a son of Cyrus and a daughter of Apries. Amasis fell victim to a veritable *damnatio memoriae* in the Persian period.

Collaboration and Resistance

It remains for us to inquire into the origin of Herodotus's presentation of the policy of Cambyses. If it is so contrary to the facts and to the statements of Udjahorresnet, it is because, at the time of his investigation in Egypt two generations later, the historian from Halicarnassus encountered informants hostile to the memory of the conqueror of Egypt—namely, Egyptian informants whom he cites numerous times. Now, at the time of Herodotus, relations between Egyptians and Persians were strained and difficult, the Egyptians having revolted several times after 525. It is this context that gave rise to legends and popular stories that presented Cambyses as the prototypical conqueror—brutal, impious, and bloody. It should be added that Herodotus also gathered information and opinion from Persian circles that were very hostile to Cambyses.

Nevertheless, it would also be excessive and misleading to suggest that the opinion and behavior of Udjahorresnet should be generalized. That the "legitimizing" propaganda of Cambyses would have been ubiquitous and clever is one thing; that it would have aroused unanimous adherence and sympathy is another. The allegiance of Udjahorresnet himself was won conditionally: he would not have recognized Cambyses' power unless Cambyses had adopted the rules and precepts of traditional pharaonic royalty.

Moreover, several indications suggest that not all Egyptians were ready to submit to the Persian king. Herodotus (III.14♦) describes the punishment incurred by the Egyptians who massacred the herald sent by Cambyses to Memphis: 2000 young Egyptians, "their mouths bridled and a rope round their necks," were led to execution, the royal judges having decided that "for each man [massacred by the Egyptians] ten Egyptian noblemen should die." The staging of the "spectacle" is equally significant: the condemned were paraded before the conquered pharaoh, who was surrounded by the fathers of the victims. Anxious above all to throw into relief the dignity of Psammetichus, Herodotus states that the pharaoh remained stone-faced upon seeing his son, unlike his companions, who dissolved in grief. Similarly, a few minutes earlier, Psammetichus had

said nothing when his daughter was paraded, clothed as a slave, along with young aristocratic ladies, similarly dressed. Through his demeanor, the pharaoh expressed his refusal to accede to the new power.

Indeed, Herodotus reports that Cambyses, who “felt a touch of pity,” ordered the son of Psammetichus to be spared. In reality, he was the first to be put to death! He adds that Psammetichus “lived at court from that time onward. Here he was well treated,” and he even thinks that “if he had only had the sense to keep out of mischief, he might have recovered Egypt and ruled it as governor” (III.15♦). He explains the supposed behavior of Cambyses by a rule of the Persian kings, “who are in the habit of treating the sons of kings with honour, and even of restoring to their sons the thrones of those who have rebelled against them.” But the Egyptian examples Herodotus cites are quite unconvincing. As for the behavior ascribed to the Persian kings, it is at least nuanced by Isocrates, who says kings “as a rule . . . do not reconcile with those who rebel before they have taken them prisoner” (*Evag.* 63). It is clear that Cambyses never dreamed of returning the government of Egypt to Psammetichus. It should be emphasized above all that Psammetichus was not content merely with intrigue: “He was caught in *flagrante delicto* inciting the Egyptians to revolt; and when he was discovered by Cambyses, he was forced to drink bull’s blood; and he died on the spot. Thus was his end!” So it seems clear that the pharaoh had never agreed to recognize the one who claimed to be his successor.

Another social group—again closely linked to the Egyptian aristocracy—could with good reason claim to be unhappy with Cambyses’ activities—namely, the administrators of the Egyptian temples. It is true that Udjahorresnet emphasizes that, at his request, the new pharaoh restored to the goddess the revenues of the landed estates, “as it had been previously.” But his exaltation of the new pharaoh’s piety toward Neith of Saïs must be placed in the context of a statement that was intended primarily to stress the amount of benefactions the sanctuary at Saïs realized from the cooperation between Udjahorresnet and Cambyses. It appears that not all of the temples would have been so happy about Cambyses’ policy. The stelas marking royal generosity to the temples, so numerous before 525, disappeared in the time of Cambyses. This observation has been linked to a royal decree attributed to Cambyses. The text, unfortunately quite difficult to read, is preserved in a Demotic document on the verso of the *Demotic Chronicle*. Cambyses is accused of having set drastic limitations on the revenues in kind that the Egyptian temples collected in the time of Amasis. Only three temples were exempt from this regulation.

Many obscurities continue to surround the scope and objectives of the measure taken by Cambyses. The compilers contrast his conduct with that of Darius, who collected the Egyptian jurisprudential traditions, including those relating to “rights of the temples.” Let us simply recall that the problem of relations between the temples and the king persisted throughout Egyptian history, with the pharaohs attempting simultaneously to recognize the rights of the temples and to limit their financial power. The gifts of land to the temples were not disinterested: the pharaoh, who retained a right of eminent domain, thus developed a policy “intended less to enrich the temples than to keep active the economy of which they were the center” (D. Meeks). The Saïtes acted no differently. In this area, the discontinuity introduced by Cambyses is perhaps more apparent than real. To evaluate it, this measure must be placed in the framework of an overall study of

tribute administration in Egypt—a difficult task in view of the scarcity of documentation. Moreover, converging indications attest to the increase of tribute appropriations under his reign. The Egyptian temples no doubt did not avoid them.

It is thus quite likely that the negative image of Cambyses goes back in part to the moment of the conquest and administrative organization of Egypt. On this hypothesis, we might think that the fiscal measures enacted by Cambyses were reprisals against the sanctuaries that had little inclination to legitimate the installation of a foreign power. Whatever it was, the royal decision need not be considered a contradiction of the general policy applied to the Egyptians. As for the powerful Egyptian temples, the new pharaoh could not pursue a policy of unlimited generosity. He had to control them or risk reducing the conquest to a short-lived pretense. It was the same in Babylonia, where the proclamations of devotion to Cyrus and Cambyses went hand in hand with increased fiscal pressure (pp. 73f.). It was not only the financial power of the new pharaoh that was at stake but also the reality of his power, so recent and fragile and threatened by opposition. Perhaps this is also why Egypt was converted to a satrapy whose government Cambyses, before departing, turned over to the Persian Aryandes.

Called back by news of a rebellion in Persia, Cambyses left Egypt hastily in the spring of 522. While crossing Syria, he was wounded in the thigh; gangrene set in, and the son of Cyrus died at the beginning of summer, 522. Before returning at greater length to the events of 522, we should pause to draw up the initial balance sheet of the conquests.

Chapter 2

The Conquest and After: An Interim Summary

1. From Cyrus to Darius: Sources and Problems

By the time of Cambyses' death in 522, an impressive amount of territory had been conquered in the span of thirty years. The Achaemenid dynasty, which around 550 ruled a narrow territory of the southern Zagros, had engulfed every kingdom and empire that shared the Near East and Central Asia. The range of its dominion extended thenceforth from Cyrenaica to the Hindu Kush, from the Syr Darya to the Persian Gulf. The earlier political structures were officially dissolved, and their titulature had vanished or else had been assumed by the conquerors. From this point of view alone, the reigns of Cyrus and Cambyses would appear to be a high point on the scale of the ancient history of the Near East. For the first time, a state had been formed with a single purpose, and what is more, a state that was based not merely on continental possessions; it also had wide access to the sea via the Persian Gulf, the Mediterranean, and the Black Sea. With Cambyses, the new state had forged a naval power that allowed it to control a vast maritime front. This is in striking contrast to the geopolitical situation prevailing toward the middle of the sixth century.

Traditionally, the organizational work is attributed almost exclusively to Darius. But there is no a priori reason to distinguish sharply between a phase of military conquests (Cyrus and Cambyses) and a phase of organization (Darius). Obviously no one would dream of depriving Darius of his justified renown in this area. Nonetheless, it must also be recognized that Darius and his advisers built on preexisting structures, which emerged both from local traditions and from the initial adaptations introduced by Cyrus and his son. That said, it must be admitted that we do not have the sort of abundant and varied documentation for Cyrus and Cambyses that is available from the reign of Darius. Marked by the theme of "good king Cyrus," the Classical sources are of scant help. This remark holds true especially for Xenophon, who in the *Cyropaedia* assigns his hero an essential role in the organization of the empire: Cyrus, conqueror without peer (Xenophon even credits him with the conquest of Egypt) and creator of the Persian army and cavalry, would have been the first, after the conquest of Babylon, ever to have a global vision for the administrative organization of the Empire-in-the-making. He appointed the high officials of the central court (VIII.1.9–12), organized the finances (I.13–14), required nobles to attend the royal court (1.5–6, 17–22), etc.—everything is listed under the name of Cyrus. The same goes for the institution of satraps (VIII.6.1–15) and of the inspectors' service for the satrapies and the express postal service (VIII.6.16–18). And Xenophon insists repeatedly on the durability of decisions made by Cyrus: "And the institutions which Cyrus inaugurated as a means of securing the kingdom permanently to himself and the Persians, as has been set forth in the following nar-

rative, these the succeeding kings have preserved unchanged even to this day" (VIII.1.7⇨). But none of this presentation has any diachronic value. Xenophon instead paints a timeless tableau of the Achaemenid Empire. Sufficient proof may be found in a comparison of the identical portraits of Cyrus the Elder in the *Cyropaedia* and Cyrus the Younger in the *Anabasis*. To be sure, many of the institutions portrayed in the *Cyropaedia* are known and confirmed by many other texts, but nothing requires us to attribute them to Cyrus alone.

In fact, the strictly Persian written evidence is bafflingly sparse. Cyrus is never mentioned by Darius in the Behistun inscription other than as father of Cambyses and Bardiya. Darius, whose legitimacy as monarch was not entirely above suspicion, was not afraid to write about his predecessors: "Those who were the former kings, as long as they lived, by them was not done thus as by the favor of Ahuramazda was done by me in one and the same year" (DB §§50–52⇨). It would be going too far, however, to attribute to Darius a desire to inflict a *damnatio memoriae* on the founder of the empire. Besides, we know that the memory of Cyrus was preserved with special fervor by the Persians. Cyrus was certainly one of the "great men" whose heroic deeds were passed on to the younger generation. "Cyrus—with whom nobody in Persia has ever dreamt of comparing himself," Herodotus remarks (III.160⇨), claiming to represent Darius's views. Wishing above all to legitimate his newly won power, Darius quite naturally dedicated the Behistun inscription to exaltation of his own accomplishments, which he intended to be preserved for posterity. The Behistun inscription is not a textbook of Persian history! There are several copies of three trilingual inscriptions (in Old Persian, Akkadian, Elamite) in the name of Cyrus, found at Pasargadae. They are very short: "I am Cyrus the King, an Achaemenian" (CMA⇨), or "Cyrus the Great King, an Achaemenian" (CMC⇨). Another (CMB⇨) reads: "Cyrus the Great King, son of Cambyses the King, an Achaemenian. He says: When . . . made . . ." But these documents must be excluded from the discussion, because their authenticity is now widely contested, not without excellent reasons. They most certainly derive from Darius, taking the role of forger that is attributed to him, who wished in this particular case to draw on the prestige of Cyrus to his own advantage.

On the other hand, we can turn to archaeological records discovered in Persis, as well as to written records of non-Persian origin. The many Akkadian tablets provide indirect but valuable indications of the administration of Babylonia at the time of the founders of the Empire. Information that is drawn from texts and iconography from Judah, Egypt, and western Asia Minor may be added.

Precisely because of the nature of the available documentation, the picture of the Empire around 522 cannot be more than partial. But it is well to attempt to paint it, in order better to comprehend not just the specifics of the reforms put in place by Darius after he seized power but also the breadth and limitations of the modifications and adaptations Cyrus and Cambyses made to the organization of the countries they had just subjugated.

2. *Satraps and Satrapies*

The Satraps of Cyrus and Cambyses

The long passage Herodotus dedicates to the reforms set in motion by Darius after his victory over his opponents begins with this phrase (III.89⇨): Darius "proceeded to set up

twenty provincial governorships (*nomoi*), called satrapies." It would be venturing well beyond the evidence to conclude from this text that the first satrapies were inaugurated at the beginning of Darius's reign (which is not what Herodotus says, in any case). The term *satrap* is in fact firmly attested from the time of Cyrus and Cambyses. First of all, this is what the situation existing in 522 shows: in his Behistun inscription, Darius himself refers to Dādārši, "satrap in Bactria" (DB §§10–19), and Vivāna, "satrap in Arachosia" (DB §§54–64). We also learn that at this date Hystaspes, the father of Darius, held a high military post in Parthia-Hyrcania (and not the post of satrap of Persia, as Herodotus has it; III, III.70). In Asia Minor, the Persian Oroetes was named "governor of Sardis" by Cyrus (Herodotus III.120♦). There, as elsewhere, Herodotus does not use the term *satrap*, but the much less specific term *hyparch*. With the expression *Sardiōn hyparkhos*, Herodotus seems to refer to a vast district in Asia Minor, including both Lydia and Ionia (III.127). The residence of Oroetes is sometimes Sardis (III.126), sometimes Magnesia on the Meander (III.121). Oroetes was still in office at the accession of Darius. The satrapy of Hellespontine Phrygia is also known, held at the time of Cambyses by Mitrobates (*hyparkhos*), who resided at Dascylium (III.126). Shortly after the death of Cambyses, Oroetes put Mitrobates and his son Cranaspes to death and brought Hellespontine Phrygia under his authority. It is also known that, beginning in the fourth regnal year of Cyrus (535), a certain Gubāru was given the title "governor (*piḫatu*) of Babylonia and Trans-Euphrates." He was thus theoretically in charge of an immense satrapy that included nearly all of the countries previously under the control of the Neo-Babylonian king, from the Tigris to the approaches to the Nile. In an unclear context, he is mentioned together with a scribe-chancellor (*bēl tēmi*) of Media, which could lead one to suspect the presence of an imperial administration at Ecbatana (cf. also Ezra 6:2). As for Egypt, Cambyses provided it with a "governor/satrap" (*hyparkhos*), the Persian Aryandes (Herodotus IV.166).

It might be supposed that within the most extensive satrapies there were sub-governors, but we have no indisputable attestations for this period, except perhaps in Babylon. Otherwise, it is quite clear that the creation of satrapies did not cause the preexisting political entities to disappear. The Greek and Phoenician cities and the Babylonian towns retained considerable autonomy, as long as they fulfilled the obligations placed on them, especially the financial and military obligations. The same was true for the province of Judah within the satrapy of Babylonia and Trans-Euphrates. Xenophon (VII.4.2♦) states, with regard to Cilicia and Cyprus, that Cyrus "had never sent a Persian as satrap to govern either the Cilicians or the Cyprians, but was always satisfied with their native princes. Tribute, however, he did receive from them, and whenever he needed forces he made a requisition upon them for troops" (cf. also VIII.6.7). Herodotus says (I.28) that Cilicia had not been conquered by Croesus. It was still ruled at the time of Cyrus and Cambyses by a local dynast who bore the title *syennesis* (I.74), described as "king of the Cilicians" by Herodotus (V.118). In spite of the conquest of Xanthus by the Mede Harpagus on the orders of Cyrus, Lycia also continued under the rule of petty local dynasts, who nonetheless were required to recognize Persian power at least nominally. This situation does not necessarily imply that the Persians had no territorial base there, but we cannot verify this with a firsthand document as of this date. We are too poorly informed about the situation before Cyrus within Cilicia, Lycia, or even Caria to be able reasonably to discuss the modifications that may have come about in reaction to the Persian conquest.

The Duties of the Satrap

It is more difficult to determine the precise duties of Cyrus's and Cambyses' satraps. The actual word in Old Persian means 'protector of the realm [kingdom]'. In general, the Greek and Babylonian texts do not use the Old Persian word, preferring to render it with the more vague term 'governor' (*hyparkhos/pihatu*), and when it does appear, it generally does not convey any more specific meaning. At Behistun, when Darius names his two satraps, Vivāna in Arachosia and Dādarši in Bactria, he qualifies both as *bandaka*, a Persian term referring to a personal connection between the sovereign and the Persian aristocrats. In itself, the term connotes first and foremost the total loyalty to the king of the person described by it. In other words, the duty of a satrap was not necessarily connected to a territory. Moreover, the term *satrapy* (attributed to the Persians by Herodotus I.192) does not occur at Behistun: Vivāna and Dādarši are satraps *in Arachosia* and *in Bactria*, respectively. A satrap was first and foremost the personal representative of the king. At the same time, the examples known from the time of Cyrus and Cambyses indicate that their satraps were charged with missions in a specific territory.

A satrap was appointed by the king and had to adhere closely to the orders received from the central authority and remain accountable. Oroetes had already been a rebel in the time of Cambyses (who, according to Herodotus, wanted to dismiss him), and he clearly displayed his desire for independence when he killed the messenger of Darius. The messenger, it seems, had come to inform him of an order to appear at court (Herodotus III.126). This is confirmed by a story (probably fictionalized) of relations between Cambyses and his brother Bardiya (called Tanyoxarces by Ctesias), who had been given a major district in eastern Iran by Cyrus. An intimate of Cambyses counseled him to summon his brother: "To prove the infidelity of Tanyoxarces, he saw to it that if he were ordered to come, he would not come." Tanyoxarces did not defer to the royal command until the third summons and, says Ctesias, he was then put to death (§*Persica*, §10).

One of the primary tasks of the satrap must have been to maintain order and to extend Persian power. According to Herodotus (III.120), Oroetes fell out with Mitrobates when the latter reproached him for not having managed "to add the island of Samos to the domains of the king." After he had come over to Cambyses, the tyrant Polycrates of Samos, it seems, schemed incessantly against the Persian possessions on the mainland and showed himself to be an overt rival of the satrapal court in Sardis. He tried at the same time to gain the support of certain Lydian aristocrats who were unhappy with the government of Oroetes (Diodorus X.16.4). According to Herodotus (III.120♦), who places the event "about the time of Cambyses' last sickness," the satrap decided to put an end to the power of Polycrates. To this end, he sent his principal adviser, the Lydian Myrsos, son of Gyges, to the tyrant. Myrsos succeeded in persuading the tyrant to come and visit Oroetes, who for his part claimed to be threatened by Cambyses. Under these circumstances, Oroetes put Polycrates to death. Maeandrius then succeeded Polycrates. Although it does not imply direct submission to the Persian authorities, the death of Polycrates does attest to the desire of the satrap to expand the domains of the king.

The military duty of the satraps is also evident in the role played by Dādarši and Vivāna in 522–521 in the north and south of the Iranian Plateau, respectively. For these tasks, the satraps were definitely able to count on a standing army. We know that Oroetes "was a powerful man, being governor of Phrygia, Lydia, and Ionia, with a thousand

Persians in his bodyguard" (III.127♦). He thus had to be able to draft contingents from the conquered peoples. It is also likely that the system of assigning land in the conquered countries to Persian families began during the reigns of Cyrus and Cambyses. This was described by Xenophon as follows: "In times past it was their national custom that those who held lands should furnish cavalymen from their possessions and that these, in case of war, should also take the field" (Cyr. VIII.8.20♦). In exchange for land grants, Persian nobles of the imperial diaspora thus had to lead mounted contingents if any satrap demanded it. Since the system was seen in operation around 500 in western Asia Minor, it can reasonably be supposed that it went back to the time of the conquest.

The satraps must have been able to rely on garrisons as well. A Persian garrison was stationed at Babylon. It is possible that the rebuilding of the fortress of Old Kandahār dates to the reign of Cyrus. In Egypt, the Elephantine garrison continued, as in the past, to guard the southern frontier of the country at the First Cataract; another watched over the White Wall at Memphis. Others are known to have been at Migdol (near Pelusium in the Delta) and other Delta sites. According to Herodotus (II.30♦), the Persians retained the Saite installations, not only at Elephantine, but also "in Daphne at Pelusium against the Arabs and Assyrians, and a third at Marea to keep a watch on Libya." It is likely that the granting of land to garrison soldiers, especially well attested at Elephantine, was also inherited by the Persians from the Saites (cf. II.152). In Asia Minor, we know of the fortress of Sardis, where Croesus took refuge and was promptly besieged by Cyrus's troops. The fortress was situated on a formidable height, as is stressed by all of the ancient authors from Herodotus to Polybius. The taking of existing fortresses is presented by Xenophon as one of the goals of his Cyrus in the course of his conquests. He did this especially in the various regions of Asia Minor, particularly Caria and Phrygia, where his generals placed garrisons in the numerous citadels that had already been fortified by the Carians or the Phrygians (cf. Cyr. VII.4.1–11). Finally, the tale of the struggles of 522–520 recorded in the Behistun inscription reveals the existence of numerous citadels (Old Persian *didā*; Elamite *halmariš*) in the Iranian countries: Sikayauvatiš in Media (§DB §13), Tigrā and Uyama in Armenia (§§27–28), and Kapišākaniš and Aršādā in Arachosia (§§45, 47).

The internal organization of these districts is very poorly known. We know of the existence of the treasurer Mithradāta at Babylon in the time of Cyrus, but he was a royal, not a satrapal, treasurer. We know that there was a 'royal secretary' (*grammatistes basilios*) with Oroetes, obviously in charge of the exchange of couriers with the central court. In this regard, Herodotus (III.128♦) adds an explanatory aside: "an officer who forms part of every governor's establishment." The best-known example, the administration of Gubāru, shows that the satrap exchanged extensive correspondence not just with the central authority but also with all of his underlings and perhaps also with officials of other provinces. He thus had under his command a chancellery made up of a large number of secretaries and scribes (*sipiru*). With this in mind, we can surely assume that, from this period on, archives must have existed in every satrapal capital, organized according to imperial instructions and according to the local traditions of each conquered country.

After his victory, Cyrus entrusted the guarding of the citadel of Sardis to a Persian named Tabalus. It thus appears that he was responsible directly to the king and not to the satrap. Let us recall in this regard what Xenophon wrote about the measures he attributes

to Cyrus, stressing their permanence, as usual: "And as Cyrus then effected his organization, even so unto this day all the garrisons under the king (*hai hypo basilei phylakai*) are kept up" (*Cyr.* VIII.6.14♦). According to Xenophon (VI.1.1), the king considered this measure to be a precaution against revolts by the satraps. At the same time, it seems clear that, in a general way, the commanders of the citadels also had to function as subordinates to the satrap, to the extent that he had received orders from the king.

3. Tributes and Gifts

Revenues and Fiscal Administration

After mentioning the twenty districts (*nomoi/satrapies*) organized by Darius, Herodotus writes (III.89♦): "Darius had "each nation assessed for taxes (*pharoi*). . . . During the reigns of Cyrus and Cambyses there was no fixed tribute at all, the revenue coming from gifts (*dōra*) only." We will return below (chap. 10) to the extent of the modifications to the tribute system made by Darius. But at this point it is useful to introduce the subject in order to determine, as best we can, what revenues were paid to Cyrus and Cambyses in these regions. This means first and foremost understanding what Herodotus wrote and what he intended to tell his Greek readers.

First of all, it is self-evident that neither Cyrus nor Cambyses neglected fiscal administration. Both of them needed considerable resources to maintain their armies and to succeed in their expeditions. After each victory, Cyrus had the treasures of the conquered kings sent to his capitals: the treasure of Astyages was sent to Pasargadae. The same was true for the treasures of Croesus. It is likely that Cambyses gave similar orders in Egypt, as well as in Babylon. We know in fact that, when the Jews returned to Jerusalem, Cyrus ordered the treasurer Mithradāta to return the sacred vessels that Nebuchadnezzar had taken to Babylon after the fall of Jerusalem to the heads of the community (*Ezra* 1:7–11, 5:14–15). This is how the accumulation of royal wealth that later so impressed the Greeks began. Each imperial treasury was directed by a royal treasurer ("*ganzabara*"), such as Mithradāta in Babylon in Cyrus's time. He was charged less with literally guarding the treasure than with its management: management, the income and expenditure of capital by order of the king.

Both tribute and gifts accumulated in these treasuries. The existence of tribute levies in the time of Cyrus and Cambyses cannot be doubted. This is apparent not only in the *Cyropaedia*—which is always a priori under suspicion of anachronism—but also in Herodotus. It seems clear that the Greek cities of Ionia had to pay tribute, just as they had in the period of Lydian dominion (I.27). The principle is simple: whether in the form of "gifts" or "tribute," all peoples who acknowledged Persian supremacy were required to pay contributions in kind or in precious metal to the central authority, not to mention the military contingents or oarsmen they had to furnish in compliance with any royal requisition.

This state of affairs is expressed by Herodotus himself, who also says that one of the first measures taken by the usurper Smerdis/Bardiya in his struggle with Cambyses was "to every nation within his dominion he proclaimed, directly he came to the throne, a three years' remission of taxes and military service (*phorou . . . ateleia*)" (III.67♦; cf. Justin I.9.12). Furthermore, only the assumption of regular tribute can explain the regular and permanent exemptions known from this era. Such was the case for a people of the Helmand Valley, the Ariaspi, who, for having rescued Cyrus's army from the brink of

famine, received from the king the title *Euergetes* ('Benefactors') and thenceforth enjoyed an exemption (*ateleia*). The same was true for Bardliya, who, at the death of Cyrus, had received a major district in Central Asia: "Cyrus had prescribed that he would hold these countries while enjoying an exemption (*ateleis*)" (Ctesias, *Persica* §8).

Tribute-Paying Peoples and Gift-Giving Peoples

What, then, are the basic characteristics by which Herodotus distinguishes those he calls gift-givers from those he calls tribute-payers? Let us note from the start that this distinction is not an Achaemenid innovation; it can be found in many states of the Near East, from Mesopotamia to Egypt. It is thus likely that to a certain extent Herodotus gives a Greek cast to Near Eastern phenomena. The problem is that the vocabulary he uses manages to obscure the facts more than it lights the lamp for the modern historian. In fact, he implicitly analyzes Achaemenid tribute in terms of the tribute (*phoros*) levied by the Athenians on the membership of the Delian League, beginning in 478. But, whatever the similarities that can be established between the two organizations, we know that in reality the Achaemenid system was far more complex; tribute properly speaking was just one of the constituent sub-parts of the revenue system (chap. 10). Consequently, it would be pointless to try to determine the Near Eastern terminology concealed under Herodotus's vocabulary. Rather, we should look to Herodotus's method of literary development to bring to light his text's internal logic.

Indeed, it rapidly becomes clear that neither Herodotus's approach nor his objective is that of a specialist in fiscal practice. The discussion in III.88–117 is dedicated primarily to highlighting the political power of Darius. The introductory phrase gives the key to Herodotus's perspective: "In this way Darius became king of Persia. Following the conquests of Cyrus and Cambyses, his dominion extended over the whole of Asia, with the exception of Arabia" (III.88♦). From the first, he stresses that after the accession of the new king, "power was felt in every corner of his dominions."♦ The first act of Darius was to erect an equestrian statue to glorify himself (III.88). "He then proceeded to set up twenty provincial governorships (*arkhoi*), called satrapies . . . and each nation [was] assessed for taxes" (III.89♦).

Herodotus is trying to place Darius in both continuity and discontinuity with his predecessors, whose conquests he had described. He intends first to show his readers that Darius enlarged the Achaemenid possessions (III.117) and that his Empire thereafter extended far in all directions (III.98, 102, 106–7, 114–15). It is according to this logic that the numerical listing of levies that the king assessed on the conquered peoples proceeds from tribute proper to taxes imposed "over and above the regular tax" (III.91, 117♦) to gifts (which are also added to the tribute in the calculation of royal revenues: III.97). The parenthesis on tribute (III.89–98)—if we may venture this paradoxical formulation—is subordinate to an exposition of a political character and to a consideration of territorial strength.

It is by this same logic that at the end of his story he states that even under Darius a few "peoples upon whom no regular tax was imposed made a contribution in the form of gifts."♦ These donors were first the Colchians and the Ethiopians, who even in Herodotus's day brought "presents for their taxes." The Colchians sent "a hundred boys and a hundred girls," the Ethiopians "about two quarts of unrefined gold, two hundred logs of ebony, [five Ethiopian boys,] and twenty elephant tusks. . . . Lastly, the Arabians brought a thousand talents . . . of frankincense every year. This, then, was the revenue

which the king received over and above what was produced by regular taxation" (III.97♦). Let us attempt to explain the apparent paradox created by Herodotus's citation of the peoples who donated to Darius after peremptorily asserting that in the transition from Cyrus to Darius they passed from a system of gifts to a system of tribute.

Let us stress from the start the expression used by Herodotus: these people taxed *themselves*. The terminology explains what was in principle the voluntary nature of the gift. A similar formula is found with regard to the Libyans, the Cyrenians, and the Barcaeans, who were stunned by the victory of Cambyses in Egypt: "The neighbouring Libyans were alarmed by the fate of Egypt and gave themselves up without striking a blow, agreeing to pay tribute (*phoros*) and sending presents (*dōra*). A similar fear caused the people of Cyrene and Barca to follow their example" (III.13♦). It seems clear that from Herodotus's point of view people who sent donations were less dependent on the Great King than people who paid tribute because they were taxed. We may note also that these peoples were located at the extremities (*ta eskhata*) of the imperial territory of Darius (III.97, 106–7, 115–16), at the edge of the "inhabited world" (III.106–7♦). We may remark further that the periodicity of the gifts was not the same as that of tribute. While the Arabs' obligation was on an annual cycle, the Ethiopians paid only every two years and the Colchians every four years. But Herodotus himself expresses the limits of the very distinction that he posed as an absolute rule. On the one hand, both tributaries and donors were situated in the imperial realm, as he says very clearly regarding the Colchians (III.97). On the other hand, he states that the Libyans, the Cyrenians, and the Barcaeans did not just bring gifts to Cambyses; they also sent a tribute (*phoros*) "which they had set themselves" (III.13). Finally, he reports why Cambyses refused the gifts sent by the Cyrenians. In his opinion, the king "objected to the smallness of the amount—it was only 500 *minae* of silver."♦ In other words, however "voluntary" it may have been considered, the gift had to be of a certain value. All this leads us to believe that this amount was negotiated in advance with the king whose sovereignty was to be recognized. The Cyrenians probably "forgot" to do this; hence Cambyses' refusal of what quite reasonably appeared to him to be thinly veiled contempt.

From Cyrus to Darius

Let us return to Herodotus's contrast between Cyrus and Cambyses on the one hand and Darius on the other. In reality, Herodotus did not, strictly speaking, claim that Darius was the first to impose tribute; he intended primarily to stress that he was the first to *fix* the basis of the levies as well as their exact amounts. This is why the term *fix* recurs in his narrative several times, in different forms. This is probably the reason why, in Herodotus's eyes, Darius was the "creator" of tribute in the sense it would naturally have for an Athenian of the fifth century: a system where each subject entity was taxed by the ruling power for a determined amount, evaluated in precious metal and calculated on objective criteria. Thus the final remark on the Ethiopians, the Colchians, and the Arabs. After the reforms instituted by the king, the category of "donor" peoples (in the sense understood by Herodotus) did not disappear. But henceforth, in the eyes of Herodotus it represented more a surviving peripheral element than a constituent element of the Achaemenid tribute system.

From Cyrus to Darius, it was not the institution of tribute itself that was created from nothing; it was instead the conditions under which it was levied that were profoundly altered. This more technical point of view also explains Herodotus (III.89) when he draws

the portrait of Cyrus, considered by the Persians themselves as a "father," in contrast to Cambyses, the "despot" and Darius the "shopkeeper" (*kapēlos*), in fact "driving a bargain in all things." Cambyses "was harsh and reckless"; Cyrus, on the contrary, "was gentle and he had procured for the Persians all sorts of benefits." This is Herodotus's own interpretation, and it is quite difficult to find any factual justification for it. In the Greek portrait of Cyrus, he was a chivalrous conqueror to whom people submitted of their own free will, as Xenophon especially puts it (*Cyr.* I.1). From this perspective, assessments are considered a "gift" in the political sense used by Herodotus. One can suppose that, from Cyrus to Cambyses, the initial modification occurred when Cyrus's successor strongly increased the fiscal pressure on his subjects (whether in the form of gifts or tributes) to finance the Persian fleet needed to conquer Egypt, and thus arose his reputation for "severity." Darius was the first to set a value on land and to establish fixed numbers in proportion to this valuation and in this way perhaps earned the qualification *kapēlos* 'retail trader' that Herodotus assigns to him. But this is nothing but conjecture.

Tribute and Coinage

It is likely that at the time of the first two kings the Persian administrators generally continued to profit from the fiscal practices already in effect in the conquered countries—at Sardis, where the Lydian Pactyes was entrusted with levying tribute, as well as at Ecbatana, Babylon, or Egypt. We can also theorize that, at the time of Cyrus and Cambyses, in certain regions where there were no tribute

rolls (eventually to be established by Darius), it was the satraps who negotiated with the local leaders, with all the risks of arbitrariness that such a procedure presupposes.

It also appears clear that the levying of tribute under Cyrus and Cambyses in no way implies the existence of coinage. When the peoples furnished their tribute in precious metal, a standard of weight served as the basis for calculation: thus, for example, the "gift" of 500 minas of silver from the Cyrenians to Cambyses. If we accept that these were Babylonian minas, then the gift from the Cyrenians amounted to about 252 kg of silver. In any case, there was no specifically Persian coinage before Darius. In western Asia Minor, it seems that the gold and silver Lydian coins called "croesids" continued to be struck and used by the royal Achaemenid administration at Sardis. It is even possible that the silver "croesids" circulated only after the conquest of Sardis by Cyrus, thus virtually playing the role of royal coinage. It is quite certainly in terms of the "light" croesid that the tribute from the Greek cities to the Achaemenid administration was measured.

4. Continuities and Adaptations: The Case of Babylonia

Changes and Integration

The question remains whether the conquest resulted in real changes for the conquered populations. Where the reigns of Cyrus and Cambyses are concerned, the response can only be qualified, because the work of empire-building had just begun. It is clear that neither Cyrus nor his son wished (would they even have been able?) to bring about a total disruption of existing conditions. Many institutions known from their time find their antecedents in the Mesopotamian imperial structures of the previous centuries. In other words, the transformations did not necessarily result from suppression or destruction of the existing institutions, but more often and doubtless more efficaciously came about by gradually adapting these institutions to the new structure outlined by the conquerors.

We have seen that Cyrus himself, beginning with the conquest of Babylon, wished to put the accent more on the continuities than on the discontinuities, at least in his propagandistic assertions. He was recognized in October 539 as 'king of Babylon' and 'king of the countries' (*šar Babili/šar mātāti*), in one instance even bearing the title 'king of the countries, king of the kings' (*šar šarrāni*). The title "king of Babylon" passed very soon to his son Cambyses, who kept it for about a year (early 538 to early 537). Cambyses thus bore the title "king of Babylon" in association with his father, Cyrus ("king of the countries"), as is seen in the dual titlature found on some tablets: "Year 1 of Cambyses, king of Babylon, son of Cyrus, king of the countries." What is more, the internal administration of Babylon does not seem to have been severely damaged. For the first three years of Persian dominion, the highest administrator of the region was a certain Nabū-ahhē-bullit, who under Nabonidus already held the rank of *šakin tēmi*, the highest position in the administration after the *šakin māti* ('governor of the countries'). This system does not reflect the re-creation of the old kingdom at all, since the delegated authority of Cambyses was exercised only over northern Babylonia. Furthermore, the disappearance of the double titlature (early 537) and the creation of a satrapy under the control of the Persian Gubāru (535) indicate that after this period of transition Cyrus considered it useful to assert his direct supervision of the country. We know neither the reasons nor the circumstances that led the king to make these decisions, but the fact is clear: Babylonia was transformed at once into a full-blown satrapy. But what did this mean in practice?

At first sight, the Babylonian documentation exhibits great continuity. In the absence of any satrapal archives, the Akkadian tablets we have basically come from private archives or temple archives. They do not refer explicitly to political upheavals. In the private archives in particular, the major historical events, such as the conquest of Cyrus, would not even be noticeable if the notaries did not date their documents according to the regnal year of the sovereign in power. Several documents from the time of Cyrus and Cambyses indicate that the temple administrators continued to refer to regulations issued in the time of Nebuchadnezzar II, Neriglissar, and Nabonidus. Given these factors, it is not always easy to distinguish between the maintenance of Babylonian institutions and the assumption of power by the Persian conquerors. Thus, in a document like the *Craftsmen's Charter*, from the Eanna during the reign of Cyrus (535-534), the artisans of the sanctuary pledge themselves before the authorities (the *šatammu* and the royal Commissioner) to work exclusively on the projects of construction and restoration at the Eanna and take their oath in the name of "Bēl, Nabī, and the majesty of Cyrus, king of Babylon." If he does not keep his word, the guilty craftsman "will receive the punishment of the gods and the king." Should we see this document simply as an indication of strong continuity with prior practice? Or, rather, should it be considered *also* to be evidence of a policy of Cyrus, who was seeking to ensure the cooperation of the temple craftsmen in view of the restoration work he was then undertaking at Babylon, Uruk, and Ur?

Otherwise, many individuals continued to pursue their own careers, not in the least affected by the political changes. We may mention, for example, a certain scribe at Sippar who is attested without interruption from 545 to 500. The careers of higher officials also continued uninterrupted. Among other examples, we may cite the case of Širikti-Ninurta, who held the highest position (*šandabakku*) at Nippur from year 17 of Nabonidus to year 7 of Cambyses. The title *šandabakku* itself continues to be attested at Nippur until (and beyond) the beginning of the reign of Darius (521) and intermittently as late as 73 B.C. We can make the same observation with regard to a major business firm

like that of the Egibis, which is known from the beginning of the seventh century and which continued to operate under the reigns of Cyrus, Cambyses, and their immediate successors.

However, these formal continuities can conceal adaptations to the new conditions. The reference to prior regulations might also indicate that the regulations had undergone modification. For instance, the Egibi archives also bear witness to the integration of the Babylonian ruling class into the new imperial context. A tablet dated 537 states that the principal representative of the firm, Itti-Marduk-balāṭu, did business at Ecbatana, with the debt payable (in Babylon) in dates at the Babylonian rate. Four years later, the same person is found operating the same way at a place in Iran, with the debt payable at Ecbatana. Furthermore, several tablets dated to the reign of Cambyses (another is dated to the reign of Bardiya/Vahyazdāta?) show that the Egibis also did business in Persia, specifically at Ḥumadēšu, which is identified with Matezziš, very close to the site of Persepolis. The same Itti-Marduk-balāṭu entered into contracts there four times and also bought slaves with Iranian names there, whom he sold in Babylon, before selling them back again to his original business partner in Matezziš. Among other things, these documents show that the Egibis were able to adapt very quickly to the new conditions that derived from the Persian conquest, at the same time that the conquerors were perfectly able to exploit the possibilities opened by the Babylonian institutions and hierarchies.

Temple Lands and Royal Administration

The existing documentation also permits us to determine that the satrap Gubāru was involved in numerous matters. Given the fact that the majority of relevant tablets come from temple archives, his relations with the authorities of these temples are particularly well attested. This is particularly true of the Eanna of Uruk, which is dedicated to the goddess Inanna-Ištar, the “Lady of Uruk.” The Eanna was in control of vast agricultural areas irrigated by a sophisticated system of canals in a network along the Euphrates and dedicated primarily to growing cereals (barley in particular) as well as dates. Some of the land remained more or less fallow and was used to pasture sizable herds of livestock that were branded with the star of the goddess. It was from these lands that the temple drew its most clearly visible revenues. This is why the assessment of the standing crops (*imittu emēdu*) was so important in the agricultural calendar. In the beginning, it is likely that this operation was linked to the calculation of the tithe that everyone, including the king, had to pay to the Babylonian temples.

In principle, the temple administration was autonomous and controlled by the free citizens (*mār banē*) of the city of Uruk, who gathered in assembly (*puḫrū*) to adjudicate differences that might arise, for example, between the temple authorities and their subordinates or the ordinary farmers. The supreme authority over temple affairs consisted of the director (*qīpu*) and the administrator (*šatammu*) of the Eanna. The administrator was in charge of the lands, management of temple personnel, and activities relating to religious service. From the eighth year of his reign (553) on, however, Nabonidus, assisted by his son Bēlshazzar, introduced modifications that in general were not rescinded by Cyrus and Cambyses. In order to gain tighter control over such strategic financial powers and to improve agricultural profitability, the royal authority decided to play a direct role in the economic activities of the Babylonian temples under its control. Henceforth, the administrator of the temple of the goddess of Uruk was flanked by a “royal commissioner, overseer of the Eanna,” who acted simultaneously as royal official

and administrator of the Eanna. The Eanna also had a "head of the royal cash box," clearly a manager and protector of royal interests.

The most important of the modifications introduced by the son of Nabonidus, in the name of his father, was the creation of what is now called the *ferme générale*. The system "consists, as far as we are able to recreate the main features, of putting under the authority of a man or a small staff a certain amount of land and a certain number of men, on condition that the *fermier général* ('chief farmer') deliver a quantity of grain or dates fixed in advance" (F. Joannès). The farms (barley or dates) were allocated to the highest bidder. The royal commissioner was present at every stage: the conclusion of the contract with the *fermier général*, assessment of the harvest, transportation of the harvest, and so on. After the Persian conquest, a man named Kalba was *fermier général* of barley. He kept his post during the first two years of Cyrus, but thereafter the position was associated with Nergal-epuš for barley and Ardiya for dates. Beginning with the third year of Cyrus, Ardiya was in full control of the date farm. Beginning with Cambyses, this same concession was assigned jointly to four farmers, Ardiya retaining the most important farm until the end of Cambyses' reign. The same fragmentation is recorded for the barley farm. At the initiative of Gubāru in 528, ten temple oblates were summoned to Babylon, and a *ferme générale* was then created, with several heads. The situation at the end of the reign of Cambyses was rather different from the situation under Nabonidus. This change results in part from the tension that existed between the temple and royal power. After a short reestablishment of the *ferme générale* at the beginning of the reign of Darius for an oblate named Gimillu, the end of the development led to the reclaiming of the organization by the temple authorities. In view of intentions generally attributed to Nabonidus and his sons, this was to some extent a check on royal authority, but a check the nature and extent of which is difficult to measure because of the loss (or nonpublication) of the temple archives from Darius.

The Fiscal Obligations of the Babylonian Temples

There is no doubt whatever that the Great Kings drew considerable revenues from the Babylonian temples. Perhaps the fiscal pressure even increased in the time of Cyrus and Cambyses, especially if we recognize that, in contrast to their predecessors, the Persian kings no longer tithed to the Babylonian temples. But a recent study of the Ebabbar of Sippar seems to contradict such a clear-cut theory. In any case, the examples of royal appropriations are many and varied. Under orders received from the satrap, the authorities of the Eanna of Uruk frequently had to offer all sorts of payments. The temple repeatedly had to send laborers to do construction work at the royal palaces or furnish raw materials (wood, bricks) for buildings. Each order includes the following threat addressed to the person responsible for the delivery: "If not, he will incur the punishment of Gubāru." The temple also had to deliver foodstuffs to the court, as several documents from the time of Cyrus and Cambyses indicate. For instance, in 531 the Eanna had to deliver spices to the royal palace at Abanu. To fill this order, it had to borrow considerable amounts of silver. In 528, over a short period, the Eanna had to deliver successively 200 suckling lambs and kids, then 80 fatted oxen; several weeks earlier, the temple authorities had received an order to transport 200 casks of sweet date beer to Abanu for the provisioning of the court. Perhaps these were unusual requisitions, owing to the presence of the king and the court in residence near the Eanna. But other obligations also weighed permanently on the temples. At the Eanna, for example,

we know of the existence of royal herds that obviously were fed and maintained at the expense of the temple.

The Eanna also had to furnish soldiers to the royal administration, at least under certain special conditions. A series of tablets dating to the Neo-Babylonian period (reigns of Nebuchadnezzar II and Nabonidus) and to the reigns of Cyrus and Cambyses shows, for example, that the temple herds were sent to distant pastures on the bank of the Tigris. To maintain security, the Eanna levied and equipped archers to keep guard in the look-outs. Indeed, some of these archers who answered to the Eanna were regularly attached to the royal army, even under Cyrus.

The temples were subject to levies and assessments that also applied to the Babylonian towns and their inhabitants. In particular, all those who owned land (whether individuals or organizations) had 'corvée' (*urāšu*) obligations. This duty was required by the royal administrators so that they could maintain the canals. The Eanna of Uruk was no exception to the rule: the administrators were answerable to the king for the proper functioning of the waterways that irrigated the lands of the sanctuary. In short, the Babylonian temples did not enjoy any more or any less right of extraterritoriality under Cyrus or Cambyses than under their Neo-Babylonian predecessors.

The Jurisdiction of Gubāru

Even the organization of the *ferme générale* implied frequent interference from the satrap Gubāru, who sometimes acted directly, sometimes through the royal commissioner at the Eanna. As the authority responsible for the farming contracts that were drawn up in the presence of the "royal commissioner, overseer of the Eanna," Gubāru had to see to the strict fulfillment of the obligations laid on the *fermiers généraux*. Violators of any sort were generally summoned to Uruk by the royal commissioner. In 526, it was the satrap himself who sent the following summons to Ardiya, the date farmer:

Before the end of the month of Kislimu of year 4 of Cambyses, king of Babylon, king of the countries, Ardiya, son of Nabû-bān-ahī, descendant of Rēmūt-Ea, the *fermier général* of dates of Istar of Uruk, will bring 5,000 loads of palm fronds and give them to the palace of the king that is appointed over the Eanna, to Nabû-ah-iddin, royal commissioner, overseer of the Eanna. If he does not bring them, he will incur the punishment of Gubāru, the governor of Babylon and Trans-Euphrates. (YBT 7.168)

In the same way, he was involved in disputes regarding the irrigation work:

Aqrīya, son of Nabû-dala², will muster ten pioneers among the laborers who, divided into groups of six, are under his orders and give them for the canal Harri-kippi. If Nabû-balaṭ-šarri-iqbi, *fermier général* of the Piqūdu canal, sends (different orders) to these pioneers and does not give them (for this work), he will incur the punishment of Gubāru, the governor of Babylon and Trans-Euphrates. (TCL 13.150)

Once Gubāru even intervened to settle a dispute that arose between the authority of the Eanna and the authorities of the city of Uruk, who were refusing to see to guarding the Eanna. A decision was made by the temple administrator and the royal commissioner: the offenders were threatened with an appearance before Gubāru. And one tablet seems to imply that the punishments ordered by Gubāru and his subordinates were applied without stinting (YOS 7.128).

These examples permit us to gauge the extent to which the overlapping interests of the cities, temples, farmers, and royal administration forced the satrap to intervene judicially, at the expense of the city assembly (*puḫrū*). More precisely, in many cases Gu-

bāru's administration served as an appeals tribunal. The most striking example is the case brought by the temple authorities against the oblate Gimillu in September 538, a little less than a year after Cyrus's entry into Babylon. A crafty man with few scruples about his methods, he has already been mentioned (p. 73) in connection with his job, "in charge of livestock revenues of the Eanna." He was hauled before a tribunal at Uruk and convicted of livestock theft and sentenced. However, he continued to perform various tasks at the Eanna and to enrich himself dishonestly, apparently thanks to protection from higher-ups. He even had the nerve to appeal to the jurisdiction of the satrap. The Uruk tribunal promptly decided to send him before the royal tribunal in Babylon. Suits and sentences apparently did not keep Gimillu from regaining his position in Cambyses' time, when he was again in charge of livestock at the Eanna. At the beginning of the reign of Darius, he even acquired the date concession, as well as a barley concession. In this capacity, we find him writing to the "accountant of Babylon" to complain of the conditions laid on him. Exasperated by his chicaneries, the leaders of the Eanna summoned him in 520. He lost the *ferme générale* and then disappeared from the scene.

Administration of Land

Finally, it is likely that one consequence of the Persian conquest was redistribution of some of the land for the profit of the king and the Persian conquerors. Despite the scarcity of evidence, there is hardly any doubt that land was allotted to the crown in the first place. A good illustration of this is found in documents that required the Eanna to send labor to assist in the creation of several "paradises," royal residences par excellence. In Babylonia, as elsewhere, land was also allotted to high officials. A tablet dated 529 refers to Silā, Cubāru's superintendent (*rab bitī*)—apparently the person charged with running the satrap's estates (*bitu*: 'house'). The use of "the canal of Cubāru," which is mentioned in this text, was conceded to communities located in the region of Ḥandid, which was apparently situated not far from Sippar. Two other estates near Uruk allotted to Persians are known from Cambyses' time.

But the greatest novelty seems to have been the institution of the *ḥaṭru*. This is well documented from the second half of the fifth century because of the archives of the house of Murašū. The term refers to a community that was allotted an area that it cultivated in family plots. These plots had various names: 'hand estate' (*bit ritti*), 'bow estate' (*bit qašti*), 'horse estate' (*bit sisi*), 'chariot estate' (*bit narkabti*). The last three terms indicate that the original function of these plots was to supply soldiers for the king. Some texts (unfortunately, difficult to interpret) indicate that these plots, or some of them at least, existed at the time of Cyrus and Cambyses. One of them, dated to the first year of Cambyses king of Babylon (538), refers to a group of Egyptians represented by "the Assembly of the Elders," which, it seems, had carried out the division of plots within a bow estate. Other documents from the time of Cambyses refer to a "town of the Carians." These people seem to have settled on the king's land and to have been required to furnish soldiers. Bow estates are also mentioned in the Babylonian version of the Behistun inscription. The passage seems to provide adequate confirmation that the institution was prevalent even before the accession of Darius, or at least that it was in the process of being organized (see p. 104).

To be sure, precedents for the institution can easily be identified in pre-Achaemenid Babylonia. But, as far as we can determine, Cyrus and Cambyses gave impetus and new significance to a system that simultaneously favored the territorial establishment of the

new authority and the increase of agricultural production and royal revenues. Setting up communities of allotment-holders fully devoted to the new masters showed clearly that the conquest could not be reduced to a violent, transitory raid. Instead, the Great Kings demonstrated their intention to register their authority in space and time. The temple lands themselves were not treated any differently, because we know of the existence of *bit ritti* 'hand estates' at the Eanna during the reign of Cyrus. The holder of the estate had to pay taxes (*ilku*) to the king. We may assume that these estates allowed for the maintenance of men whose service was owed to the king by the temple. It appears that even the inhabitants of Nippur were not excluded from this system that, from the time of the first kings, permitted the conquerors to control the lands that had previously been administered directly by the governor (*sandabakku*) for the profit of the city and the temple of Enlil. To be sure, the available evidence does not allow us to speak of a general reallocation of the land of Babylonia in the time of Cyrus and Cambyses, but it must be observed that the allotment of land to individuals or groups presupposes prior confiscation and/or the opening of previously unworked land. In any case, we get the impression that the kings and their counselors did not operate either from crisis to crisis or for the short term.

5. From Bactra to Sardis

Bactrian Polity and Achaemenid Power

The extant evidence does not permit us to draw up an indisputable accounting of the innovations introduced by the conquerors. This is particularly true of certain regions, such as Central Asia, known only from archaeological data that, although plentiful, are nevertheless ambiguous. The archaeologists have revealed that Bactria was developed well before the Achaemenid period, and they infer from this the existence of state structures in Bactria from the end of the second millennium. It is this state that initiated the great hydraulic works that surveys have brought to light, particularly in the valley of the Upper Oxus (Amu Darya). The Achaemenid military conquest does not seem to have made any detectable material impact on the region, where we find a surprising stability of local traditions (especially in the pottery and the hydraulic technology). Given these factors, the conclusion has been drawn that in these countries the Achaemenid conquest at the time of Cyrus and later was no more than a kind of politico-military epiphenomenon: the introduction of a satrap, garrisons, tribute and military levies, and so on. The hydraulic works that were carried out during the period of Persian dominion thus would not need to be credited to the satrapal administration. On the contrary, the archaeological continuities tend rather to imply the upholding of strong local political traditions, on which the Persians had no effect. In short, any impact of Cyrus's conquest is undetectable in the field.

Central Authority and Cultural Polycentrism

These fundamental discoveries most opportunely remind the historian that the ways and means of imperial conquest/administration must be evaluated in the light of ethnogeographic diversity. The heterogeneity of the Achaemenid political continuum is indeed striking. The societies existing before the conquest surely had not all reached the same stage of development. What, for example, did the master of the immense Neo-Babylonian kingdom, a Phoenician city, a small Anatolian principality, and a nomadic

ethnic group of the Iranian Plateau have in common? There is nothing to suggest a priori that the conquest had the same impact on every country. We must recognize instead that the innovations took root in different ways, the conquerors adapting to the specific sociopolitical and cultural frameworks of the conquered peoples.

The best-known examples show indisputably that the conquerors never tried to unify the territories culturally. On the contrary, as we have seen, it was by building on the local hierarchy and traditions that Cyrus and Cambyses attempted to impose a new authority. The Persians, for example, did not try to spread either their language or their religion. Instead, they exhibited great reverence for the local religions and sanctuaries. Each people continued to speak its own language and use its own writing system. In Babylonia, the proclamations of Cyrus were made in Akkadian and written in cuneiform, and at least beginning with Darius the royal inscriptions were composed in three languages, Persian, Akkadian, and Elamite. When Cyrus promulgated his edict on the Jews' return to Jerusalem, it was proclaimed in Hebrew and recorded in Aramaic. With only a few exceptions, only the Persians spoke Persian, worshiped the Persian gods, and maintained the cultural traditions of the ruling socioethnic class.

Thus—can anyone reasonably doubt it?—neither Cyrus nor Cambyses had the simple aim of ruling in name only over some sort of loose federation of states that would have retained the essence of their sovereign prerogatives. Imperial multilingualism did not in itself present any obstacle to the exercise of Persian authority. It was kept under control by the Achaemenid administration's regular use of a form of Aramaic known as Imperial Aramaic. And if one observes that somewhat later the Persepolis tablets are written in Elamite, it is an Elamite laced with Persian technical terms.

The appointment of satraps in Media, Anatolia, Babylonia, Egypt, or Central Asia does not imply the systematic, formal extinction of local political entities. The administrative jurisdictions were probably modeled on preexisting politico-territorial institutions. The Great King continued to address himself to "peoples, cities, kings, and dynasts." On the one hand, the conquest led to the complete obliteration of the hegemonic kingdoms (Media, Lydia, Babylonia, Egypt) within a unified Empire. On the other hand, the institution of the satrapy perfectly illustrates the conqueror's intention of creating a new state whose unity cannot be reduced to the symbolic. The local political entities (peoples, cities, kings, dynasts) were integrated into the state, in different ways to be sure, but undeniably integrated nevertheless. All the same, the settling of a veritable imperial Persian diaspora in the provinces demonstrates the royal intent to create conditions for effective authority over the conquered territories and populations. The respect shown for the local sanctuaries by the kings went hand in hand (with the rarest exceptions) with very strict oversight of their material resources and with the obligation laid on them not to challenge Persian dominion in any way.

The means Cambyses adopted to create an *Achaemenid* navy are also instructive. The navy was not simply a haphazard conglomeration of regional contingents whose command was left to the local leaders, but rather a royal fleet constructed on the initiative of the central government and commanded by Persian officers. In this process, the subject peoples were required to pay taxes in silver or in kind and to furnish oarsmen. A final example is especially enlightening: the buildings built by Cyrus at Pasargadae. The activity of Lydian and Mesopotamian craftsmen there is indisputably attested, even apart from the stylistic and architectural borrowings from the Anatolian and Assyro-Babylonian

areas, not to mention Phoenician and Egyptian. Consider the tomb of Cyrus or the familiar “winged genius.” Moreover, the result of Cyrus’s building activities cannot be explained simply as a collage of incompatible styles in which one might find confirmation of the permanence of the earlier artistic traditions. Thus, the introduction of irrigated gardens in Cyrus’s new capital does not simply attest to the continuation of a technology well known particularly among the Neo-Assyrian kings. A more careful study shows that his landscape architects adapted the preexisting model by making the garden an integral part of the palace and one of the highlights of court life.

Thus it was not the foreign artisans (Lydian, Babylonian, Elamite, Egyptian, etc.) who worked out the plan and defined the function of Pasargadae. Just like Persepolis later on, Pasargadae was conceived in its entirety by the king and his counselors as a function of a dynastic and imperial program within which the stylistic diversity fed the political unity of the palace as a whole, rather than damaging it. The stylistic syncretism also expresses the fact that the cultural diversity of the empire went hand in hand with the exaltation of the sovereign who assured its political unity. In every case, it is better to speak of adaptations of local sociopolitical structures within an imperial framework defined by the kings and their counselors, rather than of continuities pure and simple. These adaptations do not imply the disappearance of local traditions, nor do they imply continuity of all their constituent elements. At this point, an initial methodological observation may be made: there is no *necessary* contradiction between imposition of Persian authority and maintenance/partial adaptation of regional and local conditions.

Text and Image

To return to the Bactrian example, it is important to realize that the problem it poses is unique: the history of this country, particularly during the reign of Cyrus and Cambyses, is known essentially from archaeological evidence. In fact, the Classical authors are hardly even interested in these regions before the conquest of Alexander. In the Greek imagination, these regions are located “at the extremities of the *oikoumenē*,” on which they had no real information anyway. The countries of the Iranian Plateau remain largely terra incognita. It will suffice to recall here that before the time of Alexander no ancient author saw fit to offer his readers any description of Pasargadae or Persepolis.

There is no reason to infer from this gap in the evidence that in the eyes of the Great Kings themselves the eastern Iranian countries were distant—not just geographically, but politically. On the contrary, the appointment of Bardiya, the younger son of Cyrus, to Bactra leads us to think that the Great Kings attached great importance to Bactria. And in 522, Dādarši, the satrap of Bactra, made it possible for Darius to put down the rebellions that had broken out in the northern regions of the Iranian Plateau. In the eyes of Strabo (XI.11.4), the Syr Darya itself was the “boundary” of the Persian Empire bordering on the Saka of Central Asia, and Cyrus situated several garrison towns there. In short, the silence of the Classical authors cannot be used as an indication, one way or the other.

The case of Bactria is unique because of the importance of the gap in textual evidence. On the other hand, the methodological problems it poses turn up time and again in Achaemenid countries. Susa and Elam appear to have continued to exist as if nothing had happened; not a trace of Persian presence can be found in the archaeological record before Darius; the archaeological evidence shows the perseverance of Elamite traditions

there. And we have hardly any archaeological evidence of Persian dominion in Egypt in the time of Cambyses.

Thus, the interpretations of "Bactrian" archaeologists throw a rather different light on the process of taking control in the countries conquered by Cyrus and Cambyses, then administered by the Persians for more than two centuries. Although the evidence from Bactria supports the notion that the conquest had only a superficial effect on already developed regional organization, consideration of other evidence permits a different view of the effects of the conquest on other developed regions of the empire. Consequently, the Bactrian case calls upon the historian to propose a general characterization of the question of imperial coherence, and this must await a later discussion (chap. 16).

6. *Persians and Conquered Populations*

Military Conquest and Ideological Strategy

The analysis of the regional cases leads the historian to inquire into the relationships between conquering and conquered populations. This is a basic problem to which we will return several times, because in large part it frames the discussion just mentioned about the very coherence of the imperial structure. Despite the gaps in evidence, it is imperative that we analyze the solutions adopted by Cyrus and Cambyses, insofar as these solutions also unavoidably concerned their successors.

The problem facing the conquerors can be presented in relatively simple terms. First and foremost, they needed to control the territories and populations as efficiently as possible. But considering the relatively small number of Persians, the military occupation of the territories constituted only a partial response to the problem facing the conquerors. They not only had to be able to quash whatever revolts might arise, but they also, and most importantly, had to be able to take steps to prevent revolts from arising in the first place. To this end, Cyrus and Cambyses followed an ideological strategy meant to create conditions for cooperation with the local elites, a most urgent need. This is why, rather than appearing to be outsiders bent on overturning the existing kingdoms and societies, the Great Kings endeavored to appropriate local traditions to their advantage over the long run and to present themselves as protectors of the sanctuaries. At the same time, this strategy required allowing the elites of the conquered countries to participate in the functioning of the new imperial power. But experience would soon show that the process of putting this policy in force was full of pitfalls and ambiguities.

In fact, while the adoption of this strategy seems well established in its broad outlines, we must not allow ourselves to be confused by it. The actual cooperation of the local elites presupposes that they agreed beforehand to serve the new authority loyally. We must also dispel the illusions created by the dominant view of the ancient sources. Herodotus and philo-Persian [or Persian-leaning] Babylonian and Egyptian sources tend to deny or discount the vigor of the resistance put forth by the states and kingdoms that the Great Kings coveted for themselves. In reality, no military victory was easy or immediate. The relatively humane fate that was accorded the vanquished monarchs is not evidence of Persian respect for the fallen kingdom. Rather, it was the first stage of their political strategy of "continuity," a strategy aimed at the same time at encouraging the ruling classes to ally with them. But putting this policy into effect presupposed the elites' allegiance to Persian imperial objectives—which obviously was not always the case. Cyrus

realized this quickly in Lydia: careful to cultivate the cooperation of the Lydian aristocracy, he conferred on one of them, Pactyes, the job of raising tribute, a function that he may already have been responsible for under Croesus. Pactyes turned this to his advantage by inciting the Lydians against the Persians. Of course, on the other hand, Pactyes was not representative of the entire aristocracy of the country. In Lydia, as elsewhere, representatives of the local dominant class surely collaborated and probably did not participate in the revolt. This was certainly the case with "Myrsos, son of Gyges," who held an important position in the bureaucracy of the satrap of Sardis from Cyrus to Darius. The example of Pactyes could only make the Persians reluctant to award imperial command positions to local aristocrats in the future.

The origins of these resistance movements are not easy to analyze. The example of the great rebellions of 522–520 (to which we will return in the next chapter) demonstrates that the strength and permanence of the local dynastic-political traditions are only a partial explanation. It is also true that, initially, the aristocrats legitimately feared for their socioeconomic status. The temporary concessions of the kings did not always suffice to calm their uneasiness, especially because, in the face of resistance, Cyrus and Cambyses sometimes had to retaliate. Consider for example an Egyptian noble who, after the Persian victory, "fell from great wealth to poverty . . . , had nothing but what a beggar has." He was a close companion of the pharaoh, to whose table he had access, and his economic status was intimately linked to the fate of his master, whose destiny he shared. In some sense, he was the antithesis of someone like Udjhorresnet, who had had the forethought to choose the side of the victor. The will to resist expressed by someone like Pharaoh Psammetichus could only have weakened the position of the nobles who had remained faithful to him. Hence the extreme vigor of Cambyses' reaction against the great families. It was a very clear warning aimed at the local nobility: the maintenance of their socioeconomic privileges depended on their unreserved allegiance to the victors and accepting the reality of the newly imposed imperial structures. Otherwise, their property would be confiscated and their prestige would be abrogated.

The Political Personnel of Cyrus and Cambyses

In any event, an analysis of the political staff of Cyrus and Cambyses clearly shows the limits of relying on local administrators. They are of course frequently mentioned in the most important corpus of documents, the Babylonian tablets. But—without exception—after the first years of occupation, local officials were awarded subservient jobs, not positions that involved setting policy at the highest level. Any attempt at statistical analysis of personal names is doomed from the start. In fact, the basic data of personal names come from private archives or temple archives, in which the proportion of Babylonians is necessarily overwhelming. Furthermore, the transmission of titles and professional qualifications was a matter of privilege, passed down along family lines. By contrast, we do not have a single official (satrapal) archive that could provide comparable data on the ethnic origin of the highest officials of the satrapy.

Generally speaking, the Egyptian records reveal more continuity of lifestyle from before the conquest than novelties that may have been introduced by the Persians. This is especially true of a very interesting Demotic text known as the "Petition of Peteisis." This curious text tells of the quarrels of a family of priests serving the temple of Amon of Teuzoi (El-Hibeh) from year 4 of Psammetichus I (660) to year 4 of Cambyses. Provided

with a benefice at Teuzoi, Peteisis (I) passed on his position to his son Esemteu, despite some problems, and then to his grandson Peteisis (II). While he was away on a military expedition with Pharaoh Psammetichus II (594–589), Peteisis (II) was stripped of his property and privileges. The family's troubles continued for a long time, under Amasis (570–525) and then Cambyses and Darius. The document gives the impression that, apart from references to regnal years of Cambyses and Darius, the Persian conquest was only hazily perceived. In particular, the names are all Egyptian. The reason is simple: in this text it is "ordinary" Egyptians who speak, not the officials of the satrapy. A "governor" appears, before whom the members of the family come to seek redress. But, during the reign of Cambyses, was he Persian (the satrap), or was he Egyptian? At this time, no certain solution has been found.

Let us note simply that the Persian conquest did not bring a sudden end to the careers of the high bureaucrats (Khnemibre, Ahmose) who surrounded the last pharaohs. But it appears at the same time that their place in the administrative hierarchy was relatively modest, despite the sonorous titles they gave themselves, which say more about their prestige in Egyptian society than about political parity with the Persians of the satrapy. In any event, some titles disappeared with the conquest, in particular those of "elder before the king," "elder before his master," and "known to the king." Only a man like Udjhorresnet could boast of being "known to the king (Cambyses)."

Besides, if we examine Udjhorresnet's titulature before and after the conquest, we find that he retained many traditional titles. But this is more a question of honorary titles than political functions per se. We also see that he lost the only responsible position he held before the arrival of Cambyses, that of admiral of the fleet. Under Cambyses (then Darius) he held the position of chief medical officer. This was hardly an innovation, because Egyptian physicians were famous and were used at the Persian court in the time of Cyrus (cf. Herodotus III.1). To be sure, it was an honorary position, which gave its incumbent undeniable prestige. Udjhorresnet with pride specified that Cambyses "assigned him the position of chief medical officer, [he] placed [him] beside [him] as companion and director of the palace." He decked himself out with pompous titles like "pasha, royal chancellor, sole companion, true friend of the king who loves him," traditional Egyptian titles that had already been bestowed on him under Amasis and Psammetichus. This accumulation of titles does not obscure the fact that, despite his defection to Cambyses, Udjhorresnet did not receive a single position of political influence, either from the king or in Egypt itself.

The Medes were apparently the only conquered peoples who acquired positions of the highest rank. At the news of the revolt of the Lydian Pactyes, Cyrus assigned the Mede Mazares to lead the operation of reconquest and suppression. On his death, the command passed to another Mede, Harpagus—the same man who had switched allegiance to Cyrus at the time of the conquest of Media. It was he who completed the conquest of the coast of Asia Minor. Among the generals who were with Darius at the beginning of his reign, we know another Mede, Takhmaspada. We may also cite the case of Datis "the Mede," who held a military post of the first rank at the end of the 490s and who perhaps had begun his career under Cambyses.

The position of the Medes is certainly remarkable. It is likely that after the conquest of Ecbatana Media retained special prestige among the conquered countries, perhaps because of ancient political and cultural links between Persians and Medes. But at the

same time it is clear that our perspective is somewhat skewed because of propaganda. For example, the marriage between Cyrus and Amytis, daughter of Astyages, recorded by Ctesias, is not a verified fact. It would thus be excessive to speak of a Persian-Median joint sovereignty. All of the ancient authors acclaim Cyrus as the one who uprooted ruling power from the Medes in order to transfer it to the Persians. The former are the vanquished, the latter the victors. Culturally, however, Medes and Persians were close cousins. In spite of these facts, the importance of the Median heritage in the state organization of Cyrus and Cambyses must be evaluated with detachment and moderation. The Elamite influence was far greater. In the Persian lists of known countries, starting from the time of Darius, Media is always listed after Persia. Media was also transformed into a satrapy and, unlike Persia, had to pay tribute like any other provincial government. Furthermore, no satrap of Median origin is known with certainty. Medes seem to have held only military posts. In this function they were subordinate to the orders of the king. In Asia Minor, for example, the Median generals had to cooperate (at least) with the Persian satraps, with the Persian generals, and with the commander of the citadel of Sardis, Tabalus, who also was a Persian.

It is quite remarkable that the satraps of Cyrus and Cambyses came without exception from Persian families: Gubāru in Babylonia–Trans-Euphrates, Aryandes in Egypt, Oroetes in Sardis, Mitrobates in Dascylium, Dādarši in Bactria, and Vivāna in Arachosia. The same was true for the imperial treasurer in Babylon, Mithradāta. As Herodotus says (III.64), Cambyses' entourage in Egypt also was made up only of Persians. It was "the most distinguished" Persians that the dying king called before him to exhort not to let the Medes take control. Among these aristocrats, Herodotus particularly distinguishes the Achaemenids themselves. For example, the future king, Darius, enjoyed a high position at the court of Cyrus and Cambyses (Aelian, *VH* XII.43; Herodotus III.139), and his father Hystaspes governed Parthia-Hyrcania or at least occupied a very important military position there (*DB* §35). It was also Persians who held trusted positions around the king, such as, under Cambyses, the "message-bearer" Prexaspes (whose son served as royal cupbearer) as well as the royal judges—for example, Sisamnes, who was put to death by Cambyses (Herodotus III.34; V.25).

Considered as a whole, the composition of the political staff under the first kings demonstrates the grip on power held by the representatives of the Persian aristocracy in the government of the Empire. It was exclusively Persians who held the command and policy positions. This simple observation strikingly confirms that the Empire-in-the-making was not simply the juxtaposition of preexisting state structures; it was an entirely new empire, where the conquerors, grouped around their king, kept for themselves positions, prebends, and benefices. The local political and social structures and elites were not appropriated, except to the extent they could be integrated into the new state-information. Local dignitaries were associated with the government of the Empire as auxiliaries to a new ethnically and socially homogenous ruling group. This group would henceforth become the dominant socioethnic class, consisting for the most part of representatives of the great aristocratic families of Persia.

Contacts and Acculturation

This observation obviously is not meant to imply that the Persians did not establish close relationships with the local ruling classes. Some examples and simple logic suggest

the opposite. In some regions, particularly in Fārs and Ēlam, as we have seen, the contacts and exchanges predate the conquest of Cyrus. In Babylonia, for example, during the first quarter of the sixth century, there were Babylonians with Iranian patronymics. In a document from the reign of Cambyses, issued in Persia to Matezziš, the descendant of a Babylonian has an Iranian name (Bagapada). But we know nothing more about possible marriages between Persians and members of other peoples. We might almost suppose that during this period some of the Persian kings' concubines might have been Babylonian in origin. On the other hand, in Asia Minor, marriages between the Sardian aristocracy and families of the Greek cities, so abundantly attested from the Mermnad period, are completely absent from the documentation of the early Achaemenid period.

Among local princes who were fascinated by Persian luxury and ways of life, Polycrates, the tyrant of Samos, stands out. Herodotus (III.125◊) states that "apart from the lords of Syracuse, no other petty king in the Greek world can be compared with Polycrates for magnificence (*megaloprepeiē*)." And numerous ancient authors like to cite the example of the tyrant of Samos, since one of their favorite topics was the relationship between power, wealth, and decadence. In their eyes, Polycrates epitomized the characteristics they commonly imputed to oriental kings, especially their love of luxury (*tryphē*). At Samos he re-created a genuine court, to which he brought celebrated poets (such as Anacreon) and also craftsmen recruited at high price (cf. Aelian, *VH IX.4*). He established workshops to produce sumptuous fabrics and celebrated drinking vessels. The opulence of the furnishings of the men's hall (*andrōn*) was well known, not to mention the pomp of the banquets held there. Among the creations that the ancient authors underscore was a neighborhood in Samos reserved for prostitution. Clearchus states that this quarter was modeled on one at Sardis and was in competition with it. There can hardly be any doubt that it was a sort of park, a "paradise." It is also said that Polycrates brought fabled animals from everywhere: dogs from Aegina and Laconia, goats from Seyros and Naxos, sheep from Miletus and Attica, hogs from Sicily (cf. Athenaeus XII.540e-f). This constitutes one of the traditional functions of oriental paradises, which were also gardens for acclimatizing exotic species. In Polycrates, then, we have an example of a Greek tyrant fascinated by the luxury of the oriental courts, in whose eyes political rivalry was also expressed in the sumptuousness of court life. According to Herodotus (III.122◊), "he had high hopes of making himself master of Ionia and the islands." In Polycrates' view, contending with Sardis for power entailed copying and equalling the luxury of the Lydian kings and, later, of the Persian satrap of Sardis, who in a certain sense succeeded the Lydian kings.

The case of Polycrates is all the more interesting because a number of his innovations antedate the Persian conquest. The same authors who liked to extol the luxury of the Lydians in every aspect of life also condemned their love of luxury. The rivalry between the courts of Polycrates and Oroetes takes place in an ongoing history. Thus, on arriving at Sardis, the Persians adopted some of the Lydian royal practices to their advantage. Paradises are attested in Lydia before Cyrus, not just at Sardis but also at Dascylium; likewise, royal hunts (cf. Strabo XIII.1.17). This is not to say that Cyrus got the idea for the paradise at Pasargadae from Sardis. Such parks were known in Assyria and elsewhere well before. Rather, the Persians probably spread the model of the paradise still more widely in Asia Minor. Xenophon (*Cyr.* VIII.6.12◊) reports that "Cyrus" enjoined his satraps to "have parks, too, and keep wild animals in them." We might say, then, that social

intercourse between the Lydian and Persian aristocracies ensured that their social behavior would not diverge very much from each other.

In Asia Minor we have further evidence of cultural exchange from this period. But the traces of Iranian influence are rare. One of the most frequently cited examples is the pyramidal tomb of Sardis (fig. 1, p. 87), which is so similar to the tomb of Cyrus at Pasargadae in Fārs that it is believed to have been built by a Persian aristocrat of the satrapal court shortly after the conquest of Cyrus. The tomb at Buzpar in Fārs also has obvious similarities to that of the founder of the Empire. Another tomb discovered near Phocaea, at Taš-Kule, shows principles of construction that appear to relate more to Persian traditions than to Lydian-Anatolian heritage. Unfortunately, the debate over the dating of the monument (either 540 or during the fifth century) is not settled. It thus cannot be said with certainty to represent the first generation of the imperial Persian diaspora.

In any event, in Asia Minor, the Persians encountered more than the local aristocracies. They also underwent strong Greek influence, just as the Lydian court of the Mermnads did. Striking evidence is found in the paintings on the four sides of a tomb found in Lycia at Kizilbel, near Elmali. The paintings essentially represent mythological scenes belonging to the Greek iconographic tradition. Other scenes probably allude to incidents from the life of the local prince who was buried there: a sailing scene and hunting scenes (wild boar, stag, and lion). To be sure, the scenes of the hunt and the funerary banquet would later be incorporated into the style traditionally known as "Greco-Persian." But they belong just as much to the local repertoire and do not presuppose Persian influence, to which, however, later Lycian materials bear witness. Dated around 525, the Elmali paintings, for instance, dramatically attest to Greek cultural influence in a small Lycian dynastic court.

7. *The Seats of Power*

The Old Royal Residences

After the conquest, the Achaemenids retained the royal residences of the conquered states for themselves: Ecbatana, Sardis, Bactra, Babylon, Susa, Saïs, and Memphis. Even after the foundation of Pasargadae in Persia, all of these capitals retained an eminent place in the new Empire, but with different roles. Some, such as Memphis, were reduced to the rank of satrapal capital or subsatrapal capital (e.g., Damascus); others, like Sardis in the west or Bactra in the east, represented centers of Persian authority over wider regions; still others—Ecbatana, Babylon, and probably Susa—were promoted to royal residences in the full sense, while maintaining their position as satrapal capitals. In Ecbatana and Babylon there were not only royal archives and treasury but also one or more palaces where the king and his retinue could stay.

In the absence of systematic excavations, we know nothing of the royal palaces of Ecbatana except for the description given by Herodotus (I.98) and the late information from Polybius (X.27). Herodotus assigns the construction of the town to King Deioces, whom he presents as the founder of the Median kingdom. The building of a capital is understood as the act that founds a new state. According to Herodotus, the town developed around the palace and the treasuries and was surrounded by seven walls of different colors: white, black, purple, blue, and red-orange. The blue wall had silver battlements; the red-orange had golden battlements. On the other hand, in a description from the Hellenistic period, Polybius holds that Ecbatana was at this date "without fortifications."

He stresses instead the splendor of the royal palace, enhanced by the gleam of the columns sheathed with plates of silver and gold and with tiles that "were all silver." But it is not possible to determine what in a late text goes back to the Median period and what is the result of Achaemenid and (even later) Hellenistic alterations. What is certain is that Ecbatana continued to be one of the royal residences, with its palaces, treasuries, and archives. The town, moreover, constituted a strategic site for a power that was reaching toward Central Asia.

It is true that, beyond the proclamations of Cyrus himself, we do not know much of anything about the palaces of Babylon at the time of the conqueror and his son. We know, however, that several secondary residences provided with paradises were built in Babylon and that the king or his son stayed in them on occasion. In the *Cyropaedia*, Xenophon assigns a central position to Babylon in the organization of the imperial space. This is where he places the principal decisions made by the conqueror regarding imperial administration (VII.5.37–86; VIII.1–7). He even says (VIII.6.22) that the king spent seven months of the year at Babylon, which was deliberately chosen because of its location at the center of the Empire. There is little doubt in fact that the practice of periodically relocating the Achaemenid court was inaugurated during the reign of Cyrus. Finally, the excavations at Susa show that the Great Kings did not undertake any architectural or urbanization projects before the reign of Darius. Until that time, the remains at Susa reflect only the maintenance of Neo-Elamite cultural traditions. This observation implies not that Susa was not a residence under Cyrus and Cambyses but that at this time Susa had not yet achieved the place it would hold beginning with Darius.

Palace and Gardens of Pasargadae

In truth, Persia, cradle and nursery of the Persian people, continued to occupy a central place under Cyrus and Cambyses, especially on the ideological plane. It was in Persia that Cyrus decided to erect a new capital, Pasargadae, situated at a height of about 1900 m in the Zagros, some 40 km as the crow flies from the site of Persepolis. Strabo (XV.3.8♦) describes the conditions of the foundation of the town in these terms:

Cyrus held Pasargadae in honour, because he there conquered Astyages the Mede in his last battle, transferred to himself the empire of Asia, founded a city, and constructed a palace as a memorial of his victory.

In reality, the link of cause and effect asserted by Strabo is dubious, for the battles won at Pasargadae against the Medes were not the last ones; far from it. At any rate, numerous archaeological arguments favor a date after the conquest of Sardis for the founding of Pasargadae.

It is well to recall that, according to Herodotus (I.125♦), of the three tribes most important to the Persians, the Pasargadae were "the most distinguished; they contain the clan of the Achaemenidae from which sprung the Perseid kings." The choice of site is thus explained most naturally by its location in the tribal territory of the Pasargadae (which was both ethnonym and toponym). Throughout Achaemenid history, Pasargadae was considered the town of Cyrus. Nevertheless, it is established that Darius furthered the work of Cyrus so well that the dating of the various monuments remains cloaked in considerable uncertainty. Two palaces, which the archaeologists call P and R, have been cleared. The date of the first, a residential building in the full sense of the term, remains debated, the tendency being to attribute it to the reign of Darius. However, Palace R

without doubt goes back to Cyrus. First, it fills the function of a monumental gateway providing access to the palace complex proper. It is also to the reign of Cyrus that the *Zendan-i Sulaiman* ("Prison of Solomon") dates; it is a tower of squared stone, entered by a stairway, and its precise purpose has not been determined. Alexander the Great, sometimes called *philokyros* ('friend of Cyrus'), stayed at Pasargadae twice, at the beginning of 330 and after his return from India. He took special care of the monumental tomb in which the founder of the Empire had been buried; his political acumen led him to demonstrate public admiration for Cyrus's memory. This leaves us contradictory descriptions by several Hellenistic authors (pp. 205–208). Archaeological work now reveals that the funerary chamber proper (topped by a roof with two sloping sides) was erected on top of a monumental podium with six tiers, the entirety rising originally nearly eleven meters (fig. 2).

The Classical authors emphasize the abundance of trees planted within the funerary area. Aristobulus, cited by Arrian (VI.29.4⇨), states that the tomb was located "in the royal park; a grove had been planted round it with all sorts of trees and irrigated, and deep grass had grown in the meadow." The excavations carried out on the site have shown that this is true of all the buildings of Pasargadae, which all opened on gardens. A "royal garden" has been discovered there, with stone channels running through it and marked by basins fed by the Pulvar River, which waters the plain. There can be little doubt that the original plans for these gardens go back to the time of Cyrus, even if they were completed in the time of Darius and scrupulously maintained during the entire Achaemenid period. All of the royal palaces were so furnished, as several Babylonian documents from the time of Cambyses show unambiguously. The paradises, integrated into the Achaemenid palace space (cf. *Esther* 1:5, Vulg.), were always considered one of the most striking external manifestations of Persian wealth and luxury by the Greek authors.

The Beginnings of Persepolis

It is not only at Pasargadae that the continuity between Cyrus and Darius is visible. It can also be seen at Persepolis, which has traditionally been considered an entirely new project of Darius's. In one of his inscriptions, Darius proclaimed that he had constructed a fortress there where none had existed before (*DPf*), a legitimate assertion, for he inaugurated the work on the terrace. However, numerous remains of buildings have been discovered on the plain, indicating that a vast area of nearly 200 hectares was in the process of urbanization well before Darius. Analysis has shown that there were in fact several palaces and monumental gates and that the techniques used in their construction resemble those of Pasargadae more than those of Persepolis. We may add that some of the palatial ruins are located close to an unfinished monument, the *Takht-i Rustam* ('the throne of Rustam'), which seems to have been a nearly exact replica of the tomb of Cyrus at Pasargadae. It is sometimes interpreted as having been intended as a tomb for Cambyses. It is thus reasonable to conclude that these structures go back to the reigns of Cyrus and Cambyses. It is nearly certain that the site is the one that is called *Matezziš* (*Uvādaicaya* in Persian) in the Persepolis tablets from the time of Darius. Several Babylonian tablets make it perfectly clear that *Matezziš* was a very active urban center during the reign of Cambyses (see p. 72).

These recent discoveries and analyses do not call into question Darius's role in conceiving the Persepolitan palace complex; on the contrary, they help us situate it within

Fig. 2 (right): Tomb of Cyrus.

Fig. 3 (above): Tomb at Buzpar.

Fig. 4 (right): Tomb at Taš Kule.

the continuum of Achaemenid history. When Darius chose the site of Persepolis, it was not only to distinguish himself from Cyrus, whose work he actually carried on at Pasargadae. Nor was it simply because it was at Matezziš that he had his principal opponent of Persian origin, Vahyazdāta, executed (if the public execution was carried out there, it was rather because the city had already acquired some prestige by that time). The choice of Persepolis is explained by prior developments, which had made the region a vital, populous palace and urban center in contact with the Babylonian centers. It was also a center capable of providing the basic resources (particularly food staples) needed for the enormous works the king and his counselors had planned for the terrace. We know that, like Darius and Xerxes at Persepolis, Cyrus and Cambyses summoned workers from different parts of the Empire (especially Lydia), and we know that a ration system had been in place since the time of Cyrus (see p. 95 below). Considering these facts, it seems likely that, before the date of the first currently known Elamite tablet (509), an already well-organized "royal economy" of the Elamite type existed in Persia and that it was revised and improved by Darius and his son.

Persian Society and Empire

These regional policies imply profound modifications of the Persian way of life, which is usually thought (in a rather schematic way) to have been seminomadic or agropastoral before the conquests of Cyrus. Beginning with Cyrus and Cambyses *at the latest*, part of the population settled around the royal residences and thereafter turned to agricultural activity. However, the entire Persian population did not abandon the nomadic or seminomadic way of life. Even later, the Classical sources make it possible to identify several subgroups belonging to the Persian *ethnos* who practiced short-range nomadism along with subsistence agriculture in the valleys. Nevertheless, the general direction of the development can hardly be doubted—development that was the result of a conscious policy enacted by the kings and made possible by the influx of wealth to Persia from the military conquests.

Several Babylonian tablets from the time of Cambyses and Bardiya also explain the development of commercial activities at Matezziš. Six tablets refer to the purchase of slaves and three to contracts entered into in the city by the representative of the Babylonian business firm Egibi. They attest to the vigor of trade between Babylon and the royal residences and to the presence of Babylonian communities in Persia at this date. They also show that the Persians were fully integrated into these commercial networks, since in one tablet a Persian is called 'head merchant' (*tamkāru*). Finally, several slaves and their owners had Iranian names. If the names given to slaves were their own, they indicate that lower-class Persians could be enslaved; if they were names assigned by their Persian owners, we must conclude that prisoners of war were deported to Persia as early as the time of Cyrus and Cambyses.

In each case, the complex image of Persian society extracted from these documents is quite different from that supplied by Herodotus (I.125), who simply distinguishes agricultural and nomadic tribes. These same documents also allow us to clarify the claim of numerous Greek authors who say that the Persians "were completely unfamiliar with the concept of markets and did not use them at all," or "did not set foot in a market (*agora*), since they had nothing either to buy or sell." Herodotus also mentions a prohibition on going into debt as one of the Persian social rules (I.138). These brusque for-

Fig. 5. Relief from Palace P at Pasargadae.

mulations may find their explanation in the aristocratic ethic of which some Greek admirers of Sparta were particularly enamored. But they express only part of the truth, which the Babylonian documents will be able to enrich substantially.

8. Royalty and Authority

Royal Representations and Titles at Pasargadae

If everything suggests that the construction of Pasargadae was striking evidence of a dynastic policy, it is also true that direct links between Cyrus and his new capital are not very clearly visible in the available archaeological and epigraphic evidence. An incomplete relief found at Palace P shows a king accompanied by two servants, one of whom seems to hold a fly-whisk (or parasol?). But this image (fig. 5), similar to some reliefs at Persepolis, may date only from the reign of Darius.

There remains the famous "winged genius" carved on Gate R (fig. 6). It shows a bearded man, garbed in an "Elamite" robe, wearing a complex Egyptian-type crown, and possessing four wings. The stone formerly bore inscriptions above the "winged genius," with the very simple text "I am Cyrus the King, an Achaemenian." ♦ Hypotheses about the exact meaning of this atypical and in many ways mysterious image have come fast and furious. Influences from Egypt (the crown), Assyria (winged geniuses), and Phoenicia may be found in it. But does it relate to Cyrus himself, as is often supposed? Nothing could be less certain. Sometimes the relief is compared with a passage in Herodotus (1.209♦) about one of Cyrus's dreams, which he reported to Hystaspes, father of Darius: "I saw your eldest son with a pair of wings on his shoulders, shadowing Asia with one of them and Europe with the other." It is rather tempting to imagine that this is a metaphorical representation of Persian authority over regions of great cultural diversity.

The syncretistic originality of the monument continues to pose problems that, in the absence of comparable iconography, risk remaining insoluble.

The only "royal" Persian image dated before Darius is a seal that was still in use in the time of Darius at Persepolis but clearly goes back to a much earlier period. In fact, it has the legend "Kuraš of Anšan, son of Teispes," the person generally identified as Cyrus I, grandfather of Cyrus the Great, even though he is not explicitly identified as king. The scene engraved on it is a war scene, which, though Elamite in origin, became very popular in Achaemenid glyptic: a horseman jumps over two warriors, who lie fallen on the ground, and rushes in pursuit of a footsoldier (fig. 7). Whoever this figure may be (and he may be intentionally anonymous), there can scarcely be any doubt that at this time one of the justifications of royal authority was physical strength and bravery in war. It is around this theme that Herodotus also organizes his tale of the first confrontation between Cambyses and his brother Smerdis/Bardiya, who alone among the entire royal entourage succeeded in drawing the bow sent by the king of the Ethiopians (III.30). Beginning with the first kings, the bow appears as a symbol of royal power; this is why Cyrus was buried with his weapons (Quintus Curtius X.1.31).

The construction of the tomb of Cyrus at Pasargadae, which has an exact parallel near Persepolis (Takht-i Rustam), in itself also implies an exceptional position for the king in Persian society. The descriptions of the contents of the tomb of Cyrus confirm this. Here, for example, is what Arrian writes (*Anab.* VI.29.5–6♠):

A Babylonian tapestry served as a coverlet and purple rugs as a carpet. There was placed on it a sleeved mantle and other garments of Babylonian workmanship. According to Aristobulus, Median trousers and robes dyed blue lay there, some dark, some of other varying shades, with necklaces, scimitars and earrings of stones set in gold, and a table stood there. It was between the table and the couch that the sarcophagus containing Cyrus' body was placed.

This text shows how luxurious the court of Cyrus must have been—the richness of his garments and the abundance of jewelry—characteristics of kingship that were to endure throughout Achaemenid history.

Unfortunately, doubts about the date of the inscriptions found in Cyrus's town make reconstruction of the royal titlature problematic (*CMa–b–c*). In some of them, Cyrus is simply called "Achaemenid king"; in others, he bears the more prestigious title "Great King," which is regularly borne by Darius and his successors. But several of these inscriptions have been ascribed to Darius himself, which makes it very difficult to distinguish precisely between Cyrus's original titlature and that which was later awarded him by Darius. The only indisputable title is the simple "king." But what exactly did this title mean in Persia at the beginning of the second half of the sixth century? We do not have a single undisputed relief or inscription at Pasargadae that allows us to discuss the themes of monarchic authority and ideology during the time of Cyrus. This statement does not imply that there was no discernible development in this area during the time of Cyrus, especially after his conquests. In all likelihood, some sort of development must be assumed. But historians cannot choose their sources. Care must thus be taken in putting forth interpretive hypotheses.

It is to the Babylonian documents that we must give preference instead. The Assyro-Babylonian titlature assumed by Cyrus and Cambyses should not be taken into account here any more than the Egyptian titlature adopted by Cambyses in Egypt, because they have nothing to do with the titlature belonging to the dynasty that ruled

in Fārs. On the other hand, a passage in the *Cyrus Cylinder* is most interesting. Speaking in the first person, Cyrus appears as the son, grandson, and great-grandson of Cambyses [I], Cyrus [I], and Teispes, all of them called “king of Anšan.” It is also by this title that the Babylonian writers refer to Cyrus in the *Dream of Nabonidus* and the *Nabonidus Chronicle*. If we assume that the writers followed explicit instructions from the king, we infer from this that Cyrus, like his predecessors, was concerned to announce clearly his position as heir of the Elamite kings in the high country of Anšan. Anšan was already named Persia (Parsu), but a considerable population of Elamite origin also lived among the native Persians. Use of the title “King of Anšan” does not mean that in Persia itself the kings did not also bear the title “King of Persia,” because a few Babylonian documents in fact use this latter title. To be sure, no document from Pasargadae mentions this title, but later on it was occasionally used by Darius. Note also that in the Babylonian version of the Behistun inscription, Gaumata is accused of having fraudulently presented himself as such: “I am Barziya, the son of Cyrus, [himself] king of Parsu, younger brother of Cambyses” (DB Bab. §10).

Royal Protocol

In 522, after the execution of Smerdis/Bardiya, the seven aristocrats who led the plot made an agreement, recorded by Herodotus (III.84♦) in the following terms: “Permission, namely, for any of the seven to enter the palace unannounced (*esaggeleos*), except when the king was in bed with a woman.” It is often supposed that in reality these privileges already existed for some families under Cyrus and Cambyses. Nevertheless, the very conditions of the execution of Smerdis seem to suggest that the Great Ones were not strictly bound by the rules of protocol. The guards of the outer gates (*phylakoi*) admitted men who counted as *prōtoi* and they did not “suspect that from them could come anything of [like a murder plot]”; but it was the “eunuch messengers” who intercepted the plotters in the courtyard (*aulē*) and who accused the guards at the gate of negligence. To get as far as the royal quarters, the Seven had to kill the eunuchs on the spot (Herodotus III.77). According to Ctesias (*Persica*, §14), the Seven succeeded in their undertaking only because of the complicity of Bagapates, “who held all of the keys to the palace.” This episode thus seems to indicate that, at the time of the first kings, all of the aristocrats were subject to the usual rules of royal protocol that were meant to control access to the interior of the palace.

Fig. 6. Winged genius at Pasargadae.

Fig. 7. Seal of Kuraš of Anšan (PFS 93*).

This passage in Herodotus and the existence of an official called “messenger” (III.34) indicate that the rules of protocol known in greater detail from a later period (cf. chap. 7) were in force at the time of Cambyses. But at what date did the king become “unapproachable,” to use the word used by several Greek authors? Herodotus (I.99⇨) pushes its origin back to the Median king Deioces:

He introduced for the first time the ceremonial of royalty: admission to the king's presence was forbidden, and all communication had to be through messengers (*aggeloi*). Nobody was allowed to see the king. . . . This solemn ceremonial was designed as a safeguard against his contemporaries, men as good as himself in birth and personal quality, with whom he had been brought up in earlier years. There was a risk that if they saw him habitually, it might lead to jealousy and resentment, and plots would follow; but if nobody saw him, the legend would grow that he was a being of a different order from mere men.

In the *Cyropaedia*, Xenophon introduces the cupbearer Sacas, who at Astyages' court “had the office of introducing to Astyages those who had business with him and of keeping out those whom he thought it not expedient to admit” (I.3.8⇨). And it is to Cyrus that he attributes the introduction of court protocol, in particular, the protocol that regulated the precedence and conditions of royal audiences.

Indeed, the Herodotean chronological framework must be treated with caution. He could have transferred regulations that he knew from the courts of Darius and Xerxes to the court of a mythical Deioces. The same goes for Xenophon, who is always inclined to attribute to Cyrus the creation of a state *ex nihilo*. Still, the construction of the royal palace and residences at Pasargadae and elsewhere implies that regulations were issued under Cyrus and that these regulations organized the king's life and fixed the courtiers' obligations. Otherwise, in this area as in so many others, the first Persian kings no doubt borrowed from the ceremonial of the Assyro-Babylonian courts.

From One King to the Next

According to Herodotus (I.125⇨), the royal family itself came from a wider subcategory that he calls the *phratry* of the Achaemenids, a Greek term usually rendered ‘clan’. These clans in turn made up “tribes,” among which Herodotus especially notes three: the Pasargadae, the Maraphii, and the Maspaii: “Of these the Pasargadae are the most distinguished; they contain the clan of the Achaemenidae from which spring the Perseid kings.” It is just such a circumstance that is also represented in inscriptions from Pasargadae, where Cyrus is called Achaemenid (*CMa-b-c*). Aside from some information that has now been confirmed (the name *Maraphii* has been found in Persepolis tablets), Herodotus's presentation raises serious doubts. Because of suspicions that weigh heavily on the authorship (Darius!) of the inscriptions at Pasargadae [*DMA-b-c!*], it now appears that it is only with Darius that the term *Achaemenid* received all of its political value (see p. 111 below). It would be better to eliminate the term *Achaemenid* from the discussion and to depend on a more trustworthy document, the *Cylinder*, in which Cyrus carries his genealogy back to his great-grandfather Teispes, who is called “king of Anšan.” There we have the simple but meaningful expression of dynastic justification by right of blood.

The circumstances of the accession of Cambyses also indicate that, to assure dynastic and familial continuity, the reigning king prepared for the succession during his lifetime. By delegating to Cambyses the title “King of Babylon,” Cyrus had already clearly designated his choice. However, we should not *in any way* consider this decree to repre-

sent a co-regency, since Cambyses held the title for only a few months after the conquest of Babylon (p. 71). The Classical texts formally state that Cambyses had been designated crown prince by his father, whom he succeeded with no apparent difficulty. Nevertheless, the problem of younger siblings emerged at that very moment. The younger brother of Cambyses, Smerdis/Bardiya, had been "compensated" by the grant of a vast district in Central Asia. He was soon to show that he did not intend to settle for second place.

There is no indication that an obligation to take a wife from among the members of certain great aristocratic families was ever recognized by Cyrus or Cambyses. We know that, "born of the same father and the same mother," Cambyses and Bardiya were the fruit of the union of Cyrus and Cassandane, daughter of Pharnaspes (Herodotus II. 1; III.3). Cambyses, like his father and his successors, had several wives. He wed Phaidime, a daughter of Otanes, who certainly was a high aristocrat, since Herodotus (III.68♦) calls him "one of the wealthiest members of the Persian nobility." But in the context of royal polygamy, Phaidime was only one of the king's wives. It is quite significant that Cambyses also married his sister Atossa, Cyrus's daughter (III.88), and a bit later another of his sisters "by father and by mother" (III.31). In these instances we can see the institution of a policy of endogamy that was applied consistently by the Achaemenids throughout their history and that permitted them to wipe out the royal ambitions of any other great aristocratic family.

9. The King and the Gods

Persian Religion and Iranian Traditions

Our information on Persian religious beliefs and practices at the time of Cyrus and Cambyses is extraordinarily thin and contradictory. The existence of sacred sites can scarcely be doubted. Darius in fact accuses the usurper Gaumata of destroying the *āyadanā* (DB §14). But there is no agreement among historians on the identification of these *āyadanā*. Were they clan sanctuaries, royal sanctuaries, or something quite different? We have no royal statement that might clarify the problem. Even the archaeological findings at Pasargadae are subject to caution. The interpretation of the tower called Zendan-i Sulaiman as a fire temple has hardly any supporters today, any more than the view that considers it the tomb of Cassandane. There are also two stone plinths that are sometimes considered a ritual site, where the king could sacrifice to the sacred fire; but this is a hypothesis that currently lacks any empirical confirmation.

The problem is that we do not know very much of Iranian religion—or religions—in the first half of the sixth century. The historical existence of Zarathustra, under the name Zoroaster, is frequently recorded by Classical sources (but not Herodotus). But many uncertainties remain regarding the period and the regions where the "prophet" is supposed to have carried out his reforms, and there is even more uncertainty about the actual content of these reforms. The only available written sources, aside from the inscriptions of Darius and his successors, are the various books of the *Avesta*, the sacred book of the Iranians, which the efforts of Anquetil Duperron brought to the attention of Western scholarship in the second half of the eighteenth century. Put in writing between the fifth and seventh centuries A.D., the *Avesta* is traditionally divided into three major parts: the *Yasna* (rituals of sacrifice), the *Yashts* (hymns to various divinities), and

the *Vidēvdāt* ('law of separation from the demons'). The most recent philological studies have shown that within the *Yasna* a subgroup, the *Gāthā* ('Songs'), goes back to a very ancient origin. Zarathustra is mentioned in the *Gāthā*, and his privileged relationship with the divinity Ahura-Mazda is stressed. From the linguistic point of view, the *Gāthā* are in what is now conventionally called Old Avestan, which could go back at least to the year 1000 B.C. From the history of religions point of view, this text allows us in principle to reconstruct Mazdaism in its pre-Achaemenid phase.

Beginning with a comparison of the Achaemenid written sources and the *Avesta*, historians have strived to answer the question of whether the Achaemenids were "Zoroastrians" or, more accurately, Mazdians—that is, initiates in the religion dominated by Mazda. The problem is that the Persian evidence for the reigns of Cyrus and Cambyses hardly permits access to their beliefs in the Mazdian religion, such as it can be reconstructed from the *Gatha*. The testimony of Herodotus remains unclear: on the one hand, he Hellenizes whatever information he receives; on the other, he is writing a century after the death of Cyrus. Beginning with such poor information, it seems quite reckless to try to reconstruct what the religion of Cyrus might have been. Some think that Darius's later insistence on the preeminence of Ahura-Mazda above all other gods (*baga*) indicates that he had broken with the tradition of Cyrus, for whom Mithra was the most important god. Exactly the opposite hypothesis makes Cyrus a Zoroastrian zealot. According to this hypothesis, the great "Zoroastrian" (Mazdian) continuity of the dynasty must be stressed, rather than any break between Cyrus and Darius.

But all of these interpretations seem to be built on sand. How in fact can we contrast the beliefs of Cyrus and Darius, when the former never "spoke" and the latter left conflicting messages for his contemporaries and the generations to come? The only indication in favor of a privileged cult in honor of Mithra is the institution of horse sacrifices around the tomb of Cyrus; in Iranian tradition, these sacrifices are often associated with the cult of Mithra.

The Tomb of Cyrus and Persian Funerary Practices

There is in fact just one aspect of the religion of Cyrus and Cambyses that is documented: the funerary customs. Cyrus was buried in the tomb he had had built during his lifetime at Pasargadae. Arrian (*Anab.* VI.29.5–6♦) gives a precise description of the burial chamber. According to his informants, Cyrus was placed in a gold sarcophagus; "a couch stood by its side with feet of wrought gold . . . and a table stood there." According to Quintus Curtius (X.1.31♦), the king was buried with his weapons. Alexander in fact discovered "the king's moldering shield, two Scythian bows, and a scimitar [*akimakēs*]."

Note first of all that the style of burial of Cyrus (and his successors) does not conform to the rules of the *Avesta*. The weeping and wailing that according to Herodotus (III.66) accompanied the death of Cambyses or Persian aristocrats (cf. IX.24) also flies in the face of the traditions called "Zoroastrian." Persian practices also differ from the customs that are well attested in eastern Iran until the end of the Achaemenid period (and well after), which required exposure of the corpses to animals who would scavenge the flesh, leaving the bones to be deposited in an ossuary. Herodotus, speaking of secret rites, states that "a male Persian is never buried until the body has been torn by a bird or a dog" (I.140♦). But the reservations expressed by the author himself and the continuation of the statement, as well as a passage in Strabo, show that only the corpses of the *magi*

“were never interred without first being stripped by the birds or the dogs” (Strabo XV.3.20). Passages in Plutarch (*Art.* 18.7) and Herodotus (VII.10) also provide evidence that only inhumation, not the scavenging of the corpse, was considered normal among the Persians. The degrading character of the practice is well illustrated by the punishment inflicted on anyone who made an attempt on the life of the king: He “has his head and arms cut off and his body cast forth [to the beasts]” (Strabo XV.3.17♦). Furthermore, a passage in Ctesias indicates that cremation was contrary to established practice among the Persians (*para ton nomon; Persica* §57); this prohibition is confirmed by Strabo (XV.3.18).

Many texts, moreover, attest to the practice of inhumation. After the battle of Issus, “Alexander authorized the mother of Darius to bury whom she wished according to the custom of her country (*patrio more*). She interred (*humari*) a small number of very close relatives,” while avoiding in her current situation “the pomp of the funerals with which the Persians celebrate the last rites to the dead . . . , when the [Macedonian] victors were cremated in no costly manner” (Quintus Curtius III.12.14♦). After the death of Artachaces, who had been in charge of digging the canal at Athos, “Xerxes had him carried out and buried with all pomp and ceremony. The whole army helped to raise a mound over his grave” (Herodotus VII.117♦). This repeats a practice already attested by Herodotus among another Iranian people, the Scythians: after royal obsequies, “everyone with great enthusiasm sets about raising a great mound, each competing with his neighbour to make it as big as possible” (IV.71♦). Furthermore, the archaeological evidence is also unambiguous. At Susa, an Achaemenid burial that dates to the beginning of the fourth century has been discovered. The body of a woman had been placed in a bronze casket along with much jewelry belonging to the deceased, as well as various Egyptian alabaster vases. A cemetery has also been discovered in Syria, a short distance from Carchemish (Deve Hüyük), in which the earliest tombs go back to the eighth century. In this cemetery we can witness the change in practice from cremation to burial in the Achaemenid period.

The Sacrifices around the Tomb of Cyrus

Ctesias writes that “immediately after his death, Cambyses returned the body of his father to Persia (*eis Persas*) in the care of the eunuch Bagapates for burial (*taphenai*), and he issued orders according to his father’s last wishes” (§9). Although the phrasing is very general, it is tempting to connect it with what Arrian writes of the sacrifices instituted around the tomb “from the time of the reign of Cambyses”:

Within the enclosure and by the ascent to the tomb itself there was a small building put up for the Magians who used to guard Cyrus’ tomb, from as long ago as Cambyses, son of Cyrus, an office transmitted from father to son. The king used to give them a sheep a day, a fixed amount of meal and wine, and a horse each month to sacrifice to Cyrus. (VI.29.7♦)

Arrian’s text is fully understandable only if it is explicated in light of some types of tablets from Persepolis. One of these, called Category E (about 40 published tablets), includes quantitative information on the materials delivered to the caretakers of different religions (Iranian, Elamite, Babylonian). These materials were intended for the sacrifices themselves. Another, Category K1 (35 published tablets), includes the amount of rations (*gal*) delivered by the royal administration to the caretakers as payment for their services. Even though the Persepolis tablets are later than Cambyses, it is clear that the information

given by Arrian corresponds quite closely to what can be determined from the tablets. The priests entrusted with the sacrifices at the tomb of Cyrus received rations for themselves (a sheep per day, wine, and flour) and a horse each month for the sacrifice.

In the Persepolis tablets, the rations provided by the administration consist of the following items: flour (12 times), beer (11), wine (6), grain (4), dates (1), figs (1). We find more or less the same items intended for the sacrifices themselves: grain (23), wine (14), flour (2), beer (1), sheep (1). We may note that the caretakers never receive meat in their monthly or daily rations. In this regard, the priests of Cyrus's tomb are favored. The quantities, too, are quite extraordinary: more than 360 sheep each year. Of course, we do not know how many *magi* were involved in these sacrifices.

Horse sacrifice is not recorded at all in the tablets, and it obviously was an exceptional practice. In a passage of the *Cyropaedia*, Xenophon states that horses were sacrificed to the Sun during the feasts periodically held by the king in Persia (VIII.3.12, 24) and that a chariot was dedicated to the Sun. Here, as often, the Sun is very likely Mithra. According to Strabo (XI.14.9), the satrap of Armenia had to send the king 20,000 colts for the feasts of Mithra (*Mithrakāna*) each year. The *magi* immolated white horses in 480 in the Strymon to obtain favorable omens (Herodotus VII.113). The link between the king and the white horses, often called "sacred horses," from the Median stud farms on the Plain of Nisaea is frequently attested. Recall that, according to Herodotus (I.189), after Cyrus marched against Babylon "one of the sacred horses, the white horses, bolted, went into the river and tried to cross it, but the river engulfed it in its waves and carried it away." Cyrus "took vengeance on the river by dividing it into 360 canals." We may then suppose that it was one of these horses that the *magi* were instructed to immolate each month in front of the tomb of Cyrus.

Finally, the guarding of the tomb and the performance of sacrifices were entrusted to the *magi*. Few institutions have given rise to as much discussion as that of the *magi*. The reason is that the evidence, basically the Classical sources, is extremely confused. The term, according to Herodotus (I.101), refers originally to one of the Median tribes. It is in this sense that Herodotus (III.73) and Darius (at least in the Babylonian version) call Smerdis/Gaumata a Median *magus* (DB Bab. §10). But, in the Persian context, the *magus* was primarily a ritual attendant (cf. Herodotus I.132). Arrian's text also shows that the status of *magus* was transmitted from father to son. Besides, it is certain that from the reigns of Cyrus and Cambyses on some of these *magi* were permanently in the entourage of the kings. According to Pliny (VI.116), it was the *magi* who advised that the tomb of Cyrus be oriented toward the east. Among their prerogatives, divination (*manteia*) was well known to the Greek authors. Their task of interpreting royal dreams is attested from this period on (Ctesias §12; cf. Aelian, VH II.17 [Artaxerxes III]).

To conclude, the funerary sacrifices practiced regularly at the tomb of Cyrus offer the only indisputable example of state religion established prior to Darius. It is obvious that, in the eyes of Cyrus himself, the construction of a tomb in the town he had just founded represented an important element of his dynastic policy. When his successors committed to maintaining these sacrifices intact, it was because they wished to profit from the renown of Cyrus. The case of Cambyses continues to be problematic. Cyrus is the only representative of the dynasty who can be said with certainty to have been buried in a tomb built above ground. Beginning with Darius, the kings chose tombs dug into the cliff of Naqš-e Rostam.

10. Bardiya's Usurpation (522)

The Reputation of Cambyses

The time has come to consider the circumstances of Cambyses' death. On this topic, it is important to stress right from the start that we depend heavily on the Classical sources, particularly Herodotus, who paints an exclusively negative portrait of Cambyses. The contrast between Cyrus and Cambyses is a veritable *topos* among the Classical authors. We must return to Herodotus's account; he explains that in the course of the campaign in Egypt, tensions arose between Cambyses and his entourage. The Egyptians were not the only victims of the king's "madness"; according to Herodotus (III.30), it also caused the death of his brother, Smerdis. Then, seized by a fit of rage, Cambyses caused the death of his sister-wife while she was pregnant (III.31–32). His "closest relatives" were not the only victims. He also put to death the son of Prexaspes, his cupbearer, with an arrow (III.34–35). "On another occasion he arrested twelve Persians of the highest rank (*prōtoi*) on some trifling charge and buried them alive, head downwards" (III.35♦). Croesus also was to suffer from the madness of the king (III.36), and Herodotus adds (III.37♦), without details: "All this may pass for a sample of the maniacal savagery with which Cambyses treated the Persians and his allies during his stay in Memphis." Perhaps this is a reference to the especially cruel execution of the royal judge Sisamnes:

He had him flayed; all his skin was torn off and cut into strips, and the strips stretched across the seat of the chair which he used to sit on in court. Cambyses then appointed his son [Otanes] to be judge in his place, and told him not to forget what his chair was made of, when he gave his judgments. (V.25♦)

The information given by Herodotus need not necessarily be taken literally, and still less the "moralizing" interpretation he gives to the facts he reports. He himself stands back, hiding behind his informants ("they say"). He is quite willing to give several versions (Greek and Egyptian) of the death of the king's sister. Furthermore, it seems nearly certain that the story of the murder of Smerdis is an invention. Then again, the story of the torture inflicted on twelve Persian aristocrats is not in itself unbelievable. Elsewhere (VII.114♦) Herodotus states that, in 480 at a place called Nine Roads in Thrace, the Persians "took the same number of young men and young women of the country to bury them alive in this place," and Herodotus adds: "Burying people alive is a Persian custom; I understand that Xerxes' wife Amestris in her old age did it to fourteen Persian boys of distinguished family (*epiphaneis*), by way of a present which she hoped the supposed god of the underworld would accept instead of herself." If we reject the "moralizing" explanation of the behavior of Cambyses ("cruelty," "madness"), we may surmise that he was actually taking reprisals against the great families that had expressed opposition to some of his decrees.

According to Herodotus, Cambyses died in Syria shortly after receiving a messenger sent by the usurper who had taken power in Persia in the name of his brother Smerdis (III.62–65). Whatever the facts may be, it must be stressed that Herodotus at this point is once again highlighting some serious differences between the king and "the most esteemed of the Persians," whom he had summoned to his tent. The Persian aristocrats did not grant any credence to the version of the events presented by Cambyses: "They believed it was Smerdis, son of Cyrus, who had made himself king" (III.66). It thus appears clear that the anecdotes relating to the Persians and Smerdis were collected by Herodotus

from people in Persian aristocratic circles who faithfully preserved the traditions hostile to Cambyses. Herodotus states elsewhere (III.89♦) that the Persians considered Cambyses "harsh and careless of his subjects," and he records the opinion of Otanes, one of the conspirators of 522, who condemned Cambyses' "pride of power" (III.80♦).

Smerdis, Tanyoxarces, Mergis, Mardos

In his narrative about Cambyses, Herodotus returns several times to the case of Smerdis, brother of the king, "born of the same father and the same mother" (cf. DB §10). This individual is given a variety of different names in the Greek sources (Tanyoxarces, Tanoxares, Mergis, Mardos). The Behistun inscription and the Babylonian tablets tell us that his name was Bardiya (Barziya in the tablets). Few events in Achaemenid history raise as many questions or rouse as much debate as the short period between the demise of Cambyses and the accession of Darius. An analysis of it is all the more necessary because it allows us to evaluate more carefully the strengths and weaknesses of the Empire at the end of the reign of Cambyses.

In the version recorded by Herodotus, Prexaspes put Smerdis to death on the orders of Cambyses. After the return of his brother from Egypt to Persia, Cambyses in fact was worried, having dreamed of Smerdis "sitting on the royal throne" (III.30♦). Later, two *magi* who were brothers took advantage of the fact that the execution of Smerdis had been kept secret and that "the majority of Persians believed Smerdis was still alive." They rose up against Cambyses. One of them, Patizeithes, entrusted by Cambyses with "the care of his house," placed his brother on the throne. This brother not only was named Smerdis but also resembled him feature for feature! From then on, he ruled under the name and in the place of Cambyses' brother until a conspiracy of aristocrats overthrew him and brought Darius to power (III.61–87).

Several other Classical authors devote discussions to these events. In addition to the brief allusion to Mardos in Aeschylus (*Persians*, 770–75), two authors give more or less circumstantial accounts of the usurpation. For Ctesias (*Persica* §10–13), the break between Cambyses and his brother Tanyoxarces/Bardiya arose as the result of a dispute between Tanyoxarces and a *magus* named Sphendadates, who denounced his master. After several fruitless summons, Cambyses succeeded in bringing Tanyoxarces to court and had him executed. The *magus* Sphendadates took the place of the king's brother, profiting from an extraordinary physical resemblance, and for nearly five years occupied the position of satrap of Bactria, a position that Tanyoxarces had previously held. Among the king's confidants were the eunuchs Artasyras, Bagapates, and Izabates. The first two put Sphendadates on the throne. But Izabates, who was entrusted with transporting Cambyses' body to Persia, denounced the fraud and was put to death.

Justin's version (I.9.4–11) agrees closely with Herodotus's, but there are some differences. It too takes into account the dream of Cambyses in Egypt, recounting that Cambyses ordered Cometes, who was a "*magus* among his friends," to execute Mergis/Smerdis. Without waiting for the death of Cambyses to become known, Cometes assassinated Mergis and substituted his brother Oropastes, who became king. The fraud succeeded so well because "in the conformation of his face and body, Oropastes strongly resembled Mergis."

From this comparison, we can see that all the versions agree on one or several common motifs: the murder of Smerdis (Tanyoxarces/Mergis/Bardiya) by order of his brother

Cambyses, his replacement by a *magus* (Smerdis/Sphendadates/Oropastes), and the physical resemblance between the *magus* and Bardiya that made it possible to keep the murder a secret from everyone. But the contradictions in the details are significant. Some violate the logic of the story. In Ctesias, for example, the role of Prexaspes is taken by the eunuch Izabates, and there is no involvement of two *magi*. The plot took place at the initiative of two highly placed individuals at court, the eunuchs Bagapates and Artasyras, who decided to bring the *magus* Sphendadates to power. The chronological differences are more significant: Ctesias locates the execution of Bardiya five years before the usurpation; Herodotus places the death of Bardiya and then the usurpation of Smerdis during the expedition to Egypt; Justin states that both took place after the death of Cambyses.

Darius, Bardiya, and Gaumata

After his victories over the usurper and the rebels, Darius had a long proclamation carved on the cliff at Behistun; in it he recounted the events that led to his triumph, from his own perspective:

A son of Cyrus, Cambyses by name, of our family—he was king here. Of that Cambyses there was a brother, Bardiya by name, having the same mother and the same father as Cambyses. Afterwards, Cambyses slew that Bardiya. [This murder] did not become known to the people. Afterwards, Cambyses went to Egypt. When Cambyses had gone off to Egypt, after that the people became evil. After that the Lie (*drauga*) waxed great in the country, both in Persia and in Media and in the other provinces. . . . Afterwards there was one man, a Magian, Gaumata by name; he rose up from Paīšiyauvādā. A mountain by name Arakadri—from there XIV days of the month of Viyakhna were past when he rose up. He lied to the people thus: "I am Bardiya, the son of Cyrus, brother of Cambyses." After that, all the people became rebellious from Cambyses, (and) went over to him, both Persia and Media and the other provinces. He seized the kingdom; of the month Garmapada IX days were past, then he seized the kingdom. After that, Cambyses died of natural causes. (DB §§10–11♦ [Kent writes "Smerdis" for Bardiya and writes "by his own hand" for "of natural causes"'])

Darius also dwells on the illegitimacy of the usurper who had seized the kingdom "that belonged from the beginning to our line" and on the lack of reaction of the inhabitants:

'There was not a man, neither a Persian nor a Mede nor anyone of our family, who might make that Gaumata the Magian deprived of the kingdom. The people feared him greatly, (thinking that) he would slay in numbers the people who previously had known Bardiya; for this reason he would slay people, "lest they know me, that I am not Bardiya the son of Cyrus." Not anyone dared say anything about Gaumata the Magian, until I came. . . . (DB §13♦ [Kent writes "Smerdis" for Bardiya])

We see immediately that the version of Herodotus agrees with the statements of Darius on the most important points, in particular that the rebel was a *magus* who had assumed the identity of Bardiya/Smerdis, brother of Cambyses; that Cambyses was responsible for the death of his brother; and that the death of Bardiya was kept secret. The Behistun inscription also supplies precise information on the chronology: Gaumata's insurrection is dated March 11, 522. Starting in the month of April, the Babylonian tablets in fact begin to be dated to the reign of Bardiya (Barziya), who is called "king of the lands" and "king of Babylon, king of the lands." On July 1, Gaumata "seized power," shortly before the death of Cambyses. But we must emphasize that Darius is careful not to specify the date of the king's death, even though other events are quite consistently fixed to the month and the day throughout his narrative.

Bardiya/Smerdis and Gaumata

We can see that many obscurities about the identity of the rebel and the circumstances of his appearance persist. The general agreement between Herodotus and Darius does not in itself guarantee certainty. We know in fact that the Behistun text, on the orders of none other than Darius (DB §70), was proclaimed throughout every province of the Empire. Did a Greek version, which could have been consulted by Herodotus, exist? It is possible, but again we must note that if this be the case, Herodotus exercised his full freedom of interpretation. In fact, the points on which Herodotus differs from the text of Darius are also notable, including the role of Darius himself in the plot against the usurper (see chap. 3/2, pp. 114ff.). Herodotus also does not agree with Darius on the date of Bardiya's execution. He attributes it to Prexaspes (on the orders of Cambyses) and places it during the Egyptian expedition, whereas Darius states that Cambyses gave the order before departing for the Nile Valley. It is also noteworthy that Herodotus gives the usurper the name Smerdis—a "faithful" Greek transcription of the Iranian personal name Bardiya—while noting that, surprisingly, the *magus* had the same name as the son of Cyrus! The name Gaumata is found only in Justin, but the *magus* by this name (Cometes) was assigned by Cambyses himself to put to death the real Smerdis and was the one who put his brother Oropastes on the throne! It seems clear that Herodotus and his successors have mingled several oral versions that, at the time of his inquiry, were in circulation in Asia Minor and Greece and among the great Persian aristocratic families.

In any case, the agreements between Herodotus and Darius do not prove anything for the plain and simple reason that Darius's autobiography is itself highly suspect. Anxious to appear to be a legitimate king descended from the family of Achaemenes (DB §§1–4) and to be the restorer of dynastic legitimacy (DB §14), Darius had a serious interest in insisting on the death of Cambyses' brother and the deception of the man called Gaumata. The new king carefully highlighted the restrained character of his narrative (§58) and his love of truth (§63), but his assurances will not fully convince the reader who has been forewarned about the stereotypical character of these statements. It will also be noted that the information is not entirely consistent among the versions. The Babylonian version (§10) is the only one to call Gaumata a Mede. But what does this mean? Could it not simply be that for a Babylonian (as for a Greek or an Egyptian) the generic ethnic term *Mede* also included the Persians?

For all of these reasons, generations of historians have been asking the question: Was Gaumata really the usurper called "*magus*" by Darius, or was he just an invention of Darius, because he was anxious to conceal that it was really he who had overthrown Bardiya, the true son of Cyrus? The question may seem to be purely rhetorical, to the extent that the sources agree on the execution of Bardiya. But the rest of the story seems entirely too strange, not to say unbelievable. For Ctesias, Tanyoxarces' own chief eunuch was taken in by the scene imagined by Cambyses, "so that the *magus* deceived them by his resemblance"! How to explain, furthermore, that the execution of so important a person could be kept secret for four or five years—even, according to Herodotus (III.68–69), from his wives Atossa and Phaidime? Phaidime's discovery of the deception, as it is told by Herodotus, is more fairy tale than history.

Apparently aware of how difficult it would be to believe in a feature-for-feature resemblance between Bardiya and the usurper, Justin (I.9.11) tries to forestall the objections

of his readers (or to respond to his own) by remarking: "The secret was so well guarded because, among the Persians, the kings do not show themselves." Justin is obviously referring to the royal protocol that kept the king isolated within the royal palace. But can we be expected to believe that the king (or his substitute) would not have granted a single audience during the course of several years? In any event, Herodotus himself reports that Otanes, Phaidime's father, had doubted the official story for some time. The same was true for Otanes' companions, Aspathines and Gobryas (III.70), as well as Darius (III.71). Herodotus (III.66♦) also acknowledges the skepticism of the nobles who surrounded Cambyses on his deathbed: "They were convinced that it was Smerdis the son of Cyrus who was on the throne." It is thus obvious that the version published by Darius was not universally accepted.

When, with good reason, the modern historian casts doubt on the reality of the execution of Bardiya, the entire structure collapses like a house of cards. But it must also be remembered that nothing has been established with certainty at the present time, given the available evidence. The historian is reduced to arguing for probabilities and choosing the option that appears the least uncertain. To explore the problem, we must now entertain the hypothesis, these days generally accepted, of a deception devised by Darius himself.

Cambyses and Bardiya

To explore the theory of Darius's ploy, we need to return to the succession of Cyrus, who, as we have seen, made the decision to transfer authority before his death to his older son Cambyses rather than to Bardiya, "born of the same father and the same mother." This is the first known case of a father's choosing the crown prince; many others are known afterward. The younger son, Bardiya, received a major district in Central Asia as compensation. The reasons for Cyrus's choice elude us completely. Preference for the older son, often presented as a rule by the Classical authors, did not obligate the reigning king, who always retained total freedom of choice based on his own preference and/or analysis (cf. pp. 518–522, below). It is sufficient to recall that Cyrus's preference was expressed early, since in 539 Cambyses had already received the title "king of Babylon." Reading the address placed by Xenophon on Cyrus's dying lips leaves the impression that the king nursed some fear for the future (VIII.7.11–28). It proves in any case that Bardiya had never really accepted his father's decision. Although mollified by an exemption from paying tribute to the central court, as a satrap he remained dependent on his brother, the king. This is made quite clear by Ctesias, who states that several times Cambyses summoned his brother to the court, and twice Bardiya refused, "detained by other obligations."

One can guess that relations between the two brothers could only deteriorate. This is the import of an anecdote Herodotus (III.30) locates in Egypt. The king of the Ethiopians gave the ambassador-spies sent by Cambyses a bow, along with the following message: "The king of Ethiopia has some advice to give him: when the Persians can draw a bow of this size thus easily, then let him raise an army of superior strength and invade the country of the long-lived Ethiopians" (III.21♦), an insolent challenge that could not be met by any Persian in Cambyses' entourage. Smerdis/Bardiya, on the other hand, was "the only Persian to succeed in drawing—though only a very little way, about two fingers' breadth—the bow" (III.29♦), thus providing occasion for the "jealousy" of

Cambyes, who sent his brother back to Persia. The anecdote is particularly revealing of the relationship between the brothers. For the Persians, in fact, "the chief proof of manliness" is "prowess in fighting" (I.136◊). The king himself justified his power with his qualifications as a warrior; he was a "good bowman" (*DNB* §8h◊). Thus, in the form of a metaphor, Herodotus set forth Bardiya's aspirations to the kingship.

Of course, these observations do not clear away all of the uncertainties; far from it! If Bardiya's ambition was so obvious, we can understand perfectly well that Cambyes would have had him executed, whether before his departure for Egypt (Darius's and Ctesias's version) or after Bardiya's return to Persia (Herodotus's and Justin's version). And it is hard to believe that Cambyes would have sent him back to Persia, permitting him freedom of movement, before thinking better of it. Again we must recall that one author (Justin) places the death of Bardiya after the death of Cambyes and that this version, frankly, is neither more nor less likely than the others.

Having returned to Persia (under our hypothesis)—or not having accompanied his brother to Egypt (another possible hypothesis)—Bardiya revolted during the course of March 522, as Darius notes precisely. But was this a real usurpation, in the strict sense of the word? According to Darius, Cambyes was still alive at the beginning of July. The problem is that we cannot compare Darius to any other indisputable source. Herodotus states that Cambyes received the messenger sent by the usurper with "a proclamation "to the troops . . . that they should take their orders in future not from Cambyes but from Smerdis" (III.61◊) while he was in Syria. We also know that certain Babylonian tablets are still dated by Cambyes until mid-April 522. But these documents (of quite varied nature) do not indicate the date of the death of Cambyes decisively. On the other hand, let us emphasize once more that Justin places the usurpation of Oropastes *after* the death of Cambyes and that, according to Ctesias, "the usurper reigned *after* the death of Cambyes." Darius himself carefully distinguishes two stages: in March 522, Bardiya revolted in Persia; but it was not until July 522 that he "seized royal power." To be sure, the Babylonian tablets provide evidence that he was recognized in Babylon in April. But the expression used by Darius seems to indicate that it was not until the beginning of July that he officially presented himself as the successor to the deceased king, perhaps after an official ceremony had taken place at Pasargadae.

If Cambyes died in the meantime, we may assume that Bardiya had waited for this moment before claiming his legitimate right to the throne, using official protocols. As the son of Cyrus, "the throne was his by right," as Justin explains (I.9: . . . *cui regnum debebatur*). The situation with regard to the succession was at the same time both complex and simple. We know in fact from Herodotus (III.66◊) that Cambyes "had no children, either sons or daughters" (cf. Ctesias §12). As far as we know, this was the first time such a situation had arisen. The fact remains that after the death of Cambyes, Bardiya was the sole male descendant of the royal family. Rebel and usurper for several months, Bardiya had himself named king upon the death of Cambyes. To mark his legitimacy still more clearly, he took the wives of his "predecessor." We can now understand why Darius was motivated to date Bardiya's official assumption of power before the death of Cambyes: it was to transform into a usurper a king who could legitimate his authority by his filiation.

In any event, there is nothing to indicate that this proclamation suffered many objections. Darius himself states on the contrary that the discontent with Cambyes was old

and had already begun to appear upon his departure for Egypt. He also stresses that upon the revolt of Gaumata, "all the people conspired against Cambyses"; that the "magus" "rallied to himself Persia, Media, and the other countries"; and that no one was able to organize any opposition. He adds, it is true, that "Gaumata" reigned by terror and that he did not hesitate to put many people to death (DB §13). But, here as elsewhere, Darius's claims are subject to caution. He wishes above all to gain credence for the false idea that he was the first and only one to dare to oppose the person whom he calls a usurper. The accession of Bardiya to the throne instead implies that he had prepared his coup and that he had sufficient support in Persia to assure him the dynastic loyalty of its inhabitants. It is moreover quite noteworthy that the uprising took place in Persia itself, at Paīšiyavādā, perhaps near Pasargadae, the same place where sometime later the Persian Vahyazdāta would rise up against Darius.

Bardiya and the Persian Aristocracy

The ancient authors' presentation of the relations between Cambyses and the aristocracy leads us to believe that Bardiya succeeded in rallying to himself the great families against whom Cambyses had taken severe measures during his stay in Egypt, at a date when he could not have been unaware of the ambitions of his brother. Did Bardiya give assurances to certain heads of clans, promising them that he would rule in a manner less "despotic" than Cambyses? This is a frequently advanced hypothesis.

In his version, Darius (DB §14) condemns the measures Gaumata had taken in Persia. He takes credit for restoring to its original state the kingdom that had been confiscated by Gaumata: for restoring the 'sanctuaries' (*āyadanā*) destroyed by Gaumata; for restoring to the 'people' (Old Persian *kāra*; Elamite *taššup*; Babylonian *ūqu*) the fields, the herds, the 'workers' (Old Persian *māniya*, Elamite *kurtas*, Babylonian *agru*), and the 'clan domains' (Old Persian *viθ*) that the *magus* Gaumata had confiscated. And he concludes thus:

By the favor of Ahuramazda this I did: I strove until I reestablished our royal house on its foundation as (it was) before. So I strove, by the favor of Ahuramazda, so that Gaumata the Magian did not remove our royal House (*viθ*).

This text presents enormous interpretive problems. Let us note first of all that the claims of Darius, here as elsewhere, are a priori affected by a strong coefficient of critical doubt. It is especially clear that, in the very logic of his self-justifying discourse, he needs to present Gaumata as absolutely evil, and he thus congratulates himself for restoring things to the way they were before the usurpation of the "magus." He therefore insists on Gaumata's illegitimacy (usurper of the power of the Achaemenids), on his impiety (destroyer of sanctuaries), and on his injustice (confiscator of property from its legitimate owners). This is, traditionally, how every new conqueror as well as every usurper presents himself ideologically to the conquered countries in order to advance his own legitimacy (compare this with Cyrus's contrast of himself with Nabonidus in Babylon). We should also note that Darius's denunciations of Gaumata position Darius within the traditional representations of Iranian society, while they accuse Gaumata of attacking the interests of the army, the priests, and the peasants.

All the same, Darius's accusations are fairly specific, and they cannot be dismissed with a wave of the hand. But their historical interpretation is tricky, insofar as enormous philological problems persist, which generations of specialists have struggled with and

still do. The question is simple: what social group(s) did Gaumata/Bardiya have in mind? The word *kāra*, the term used for those Darius names as the victim of Bardiya's measures, has a fairly vague meaning, fitting the sense 'people' (in the broad sense) as well as 'army'. The vocabulary used by the composers of the Babylonian and Elamite versions does not remove the difficulty, for the terms *ūqu* and *taššup* are as vague as *kāra*, just as easily designating 'people' (or 'peoples') or 'troops'. We are immediately tempted to think of the aristocratic clans that without a doubt owned great estates devoted to agriculture and stockbreeding, worked by dependent peasants (*kurtuš*); the term *viθ* (and the corresponding Elamite *ulhi* = 'House') then would refer to the aristocratic Houses. According to this hypothesis, the "sanctuaries" destroyed by Gaumata would be the clan sanctuaries, dedicated to the heroicized ancestors of these powerful aristocratic groups; the term *kāra* would designate the aristocrats more narrowly, those who were devoted in a privileged way to the profession of war.

But this interpretation does raise reservations and feeds insurmountable contradictions, not least by transforming Bardiya into a reformer/social revolutionary who desired to rely on simple peasants to humble the economic privileges of the aristocracy. This is a wholly improbable hypothesis, for Bardiya could not forego the support of the aristocratic class, who at this time governed the Empire under the authority of the king and whose cooperation was indispensable to anyone who wished to claim supreme power. Furthermore, the hypothesis rests on an unstated and totally unacceptable assumption—namely, that in the Persia of 522 social antagonisms were based not only on objective realities but also on a very advanced class awareness, which an outsider like Gaumata would have been able to use. It also depends (without saying so) on the perfectly false parallel of the origin of certain tyrannical regimes in archaic Greece. That Herodotus (III.80–82) later sought to filter the events of 522 through a Greek mental grid is one thing; for the modern historian to follow Herodotus on this path is another. We have as much reason to be skeptical as Herodotus's own audience was (cf. III.80; VI.43).

There is a fairly simple way of resolving this contradiction. The interpretive hypothesis that we will briefly review is implicitly based on the chronology provided by Darius (but even so without insisting on it), namely: (1) usurpation by the *magus*; (2) confiscation of lands; (3) plot against Bardiya. Interchanging stages (2) and (3) is all that is needed to come up with a more reasonable explanation. If we suppose that in fact the plot against Bardiya was hatched in Syria, shortly after the death of Cambyses, it is easy to understand that Bardiya took steps to counter it. Would not the confiscations Darius speaks of first have been aimed at those who sought to remove him? The purpose of the confiscation was thus to take away from Bardiya's opponents their social and economic bases in Persia as well as in other conquered countries where they may have received land. In this framework, we may stress the importance of the Babylonian version (§13). Likewise referring to Bardiya's confiscations, it cites the herds, the workers (*agru*), and the Houses (*é/bitu*). But the parallel with the Persian and Elamite versions stops here, for the logogram *é* is followed by an expression peculiar to the Babylonian version, namely, *qašātu*. Thus for the first time we find an expression well known from the later Murašû tablets, *bit qašti*, 'bow estate' (not 'fief', as it is "translated" all too frequently). Besides confirming the existence of military tenancies in the early Achaemenid period (p. 75), the passage offers a most interesting clue. We know in fact that at a later period the royal *dōreai* in Babylonia frequently included bow, chariot, and other estates. What

Bardiya was doing, then, was preventing the rebellious nobles from using military forces connected to the Babylonian *hatrus* against him. The objective was thus not to confiscate family property; the royal power was revoking the rights of rebellious nobles to land that had been granted to them by the king on a conditional basis (*dōreai*). It was understood that in the case of insubordination these royal grants (*nidintu šarri*) could be reclaimed by the king, who could then redistribute them to loyal nobles. If this interpretation is correct, it would only confirm that the measure taken by Bardiya was based on a positive policy objective: it was meant not only to injure his opponents (confiscations) but also to cement his alliance with the portion of the Persian nobility that had supported him from the beginning (redistributions).

This interpretation presents the undeniable advantage of resolving the apparent contradictions in the documentary record without doing it violence. Bardiya was not so foolish as to turn the Persian aristocracy against him at the very moment when his power was endangered by a conspiracy; he isolated those who opposed him. It was doubtless representatives of these hostile families from whom Herodotus gathered his testimony, according to which, "he was regretted after his death by all the Asiatics under his rule, though not by the Persians themselves" (III.67♦). It was in the interest of the aristocratic Houses who had revolted against Bardiya to promote the idea that Bardiya had aroused unanimous opposition, which was obviously not the case.

Bardiya and Tribute from the Empire

Herodotus makes this remark while citing another decision made by Smerdis/Bardiya after his accession: "To every nation within his dominion he proclaimed, directly he came to the throne, a three years' remission of taxes and military service."♦ Presented by Justin (I.9.12–13) as a demagogic measure, this decision, Herodotus says, gained him the good will of the populace. Elsewhere (VI.59♦), Herodotus mentions the "Persian custom whereby a king, on his accession, remits arrears of tribute from all his subject states." But the two measures cannot be reconciled with each other, for Bardiya did not decree the forgiveness of back tribute as a "gift of joyous accession" but proclaimed an exemption from tribute and military obligations for the three years to come.

The interpretation does not seem open to doubt. Bardiya took a course opposite to that of his predecessors, in particular Cambyses, whose reign had brought an increase in tribute appropriations from the conquered peoples. If Bardiya had taken an equally drastic measure, we would expect discontent among the subject peoples to have surfaced. Darius himself states that, after the departure of Cambyses for Egypt and the execution of his brother Bardiya, the "Lie" (*drauga* = 'rebellion') spread not only among the Persians but also among the Medes and other peoples (DB §§10–11). It is true that otherwise he dates the great revolts as beginning in late September 522—that is, after the execution of the person he calls Gaumata. But these revolts themselves can be considered the brutal end of a period of widespread troubles, revealing imperial dysfunction. The enormous levies required by Cambyses for the construction of a navy and for the expedition to Egypt weighed too heavily on the subject peoples, above and beyond the arbitrary requirements of the satraps. To reestablish order and to combat centrifugal forces, Bardiya found himself forced to take a protective measure. With this step, we can suppose, he and his counselors dreamed of reforming the system of imposing tribute—a reform that came about with Darius. It is not out of the question that Bardiya's analyses

of the situation were shared by a certain number of nobles who were uneasy with the troubles that were brewing in the Empire and who, for this reason, chose to support his coup d'état against Cambyses. But it is likely that, at the same time, he aroused the hostility of other Persians, who were unhappy to see the profits of the Empire slip through their fingers even temporarily and doubtless more inclined to repression than to tactical accommodations. This could be the source of Herodotus's suggestion about the poor reputation that Smerdis/Bardiya left among the Persians (III.67). Undoubtedly, the mention of Mardos in Aeschylus (*Persians* 773–775) flows out of this current: "Mardos was fifth to take power, a disgrace to his fatherland and to this ancient throne." This note by Aeschylus is especially interesting because it seems to recognize the legitimacy of Mardos while at the same time condemning his way of governing.

Whatever the particularly difficult imperial and dynastic situation Bardiya found himself in, he never intended to sell off the conquests of Cyrus and Cambyses. The suspension of tribute and military contingents was only temporary. It was intended to calm the uneasiness and discord of the subject peoples in order to set up a new system of assessment. In itself, the tribute policy of Bardiya attests to contradictions in the imperial structure at the time of the death of Cambyses. It also attests to the clear political thinking of the person whom Darius presents as a usurper.

Chapter 3

Trouble, Secession, and Rebuilding (522–518)

1. Darius Comes to Power (522)

The Conspiracy of the Seven: Darius and Herodotus

The ancient sources contain major contradictions regarding the identity of Gaumata/Smerdis, and using them for reconstructing the conditions surrounding the removal of Smerdis and the coming to power of Darius is correspondingly complicated. According to Herodotus (III.68–70), it was Otanes who initiated a conspiracy, being “the first person to suspect that he [Gaumata/Smerdis] was not the son of Cyrus but an impostor” (§68♦). When a conversation with his daughter Phaidime reinforced Otanes’ conviction, he “took into his confidence Aspathines and Gobryas . . . and told them of his discovery.” The three men then came to an agreement, and each of them chose a fully trustworthy companion: “Otanés chose Intaphernes, Gobryas Megabyzus, and Aspathines Hydarnes.” When Darius arrived on the scene “from Persia . . . it was decided to add him to the number” (III.70♦).

In this story, the role of Darius appears singularly minor: until his arrival, Otanes is the central character in the drama. At this point (III.71), the tone of Herodotus’s story changes: from now on, he shows Darius and Otanes on opposite sides in the discussions about strategy and tactics held among the Seven. Otanes was particularly opposed to the rapid action urged by Darius. Darius’s arguments convinced Gobryas, then the other conspirators (§73). Darius’s resolution prevailed once more as the Seven conferred a second time on the way to the palace (§76). Once they had entered Smerdis’s quarters, it was Darius and Gobryas who fell on the usurper. In complete darkness, Darius thrust Smerdis through with his sword, as Smerdis was being held by Gobryas (§79). Finally, a few days later, the Seven held a meeting at which Otanes, Darius, and Megabyzus quarreled about the political outcome of the crisis they had stirred up. By arguing in favor of a monarchy, Darius again won the approval of the other four conspirators (§§80–83). In the last phase, Otanes withdrew from the competition (§§83–84) and the royal title was contested by the six remaining conspirators. Darius took it through a ruse effected by his groom (§§85–87): “In this way Darius became king of Persia” (§88♦).

In the text of his proclamation at Behistun, Darius does not embarrass himself with such details. From the beginning, he proclaims loudly and clearly that his royal authority derived from the heritage of his ancestors and the protection of Ahura-Mazda. This is the basic article of self-justification to which he returns incessantly. He also recalls the origins of the usurpation of Cambyses’ rule by Gaumata the *magus*, and he stresses that no one, neither Persian nor Mede nor anyone else, dared to rise up against the false Bardiya. In contrast, he, Darius, with the aid of Ahura-Mazda, “with a few men slew that Gaumata the Magian, and those who were his foremost followers. A fortress by name

Sikayauvatiš, a district by name Nisāya, in Media — there I slew him. I took the kingdom from him. By the favor of Ahuramazda I became king; Ahuramazda bestowed the kingdom upon me” (29 September 522; DB §§1–13♦). The measures taken by the new king to reestablish the order that was destroyed by Gaumata follow (§14).

Darius thus attributed to himself a role that was not merely dominant but hegemonic: the “few men” who gave him a hand appear only in the background; their subordinate status could only further enhance the royal image of Darius, who presented himself as the only person who could eliminate the usurper. So it continues throughout the long narrative — absent from Herodotus’s version — dedicated to the cumulative recital of victories won by Darius. Of course, here and there the king gives the names of the generals who fought under his command, but in every case credit for the victory comes back to him, as a result of the protection that Ahura-Mazda unceasingly provided to his royal person.

Herodotus and Darius would thus be in flagrant contradiction if Darius did not suddenly recognize the other six in a closing paragraph: “These are the men who were there at the time when I slew Gaumata the Magian who called himself Bardiya; at that time these men cooperated as my followers (*anušīyā*).” A list of six names and a solemn declaration follow: “Saith Darius the King: Thou who shalt be king hereafter, protect well the family posterity of these men” (DB §§68–69♦ [Kent writes Smerdis for Bardiya]).

Note first that the lists of names given by Herodotus and Darius generally agree:

DB §68	Herodotus III.70
Vidafarnab, son of Vāyaspāra	Intaphernes
Utāna, son of Thukra	Otanes, son of Pharnaspes (III.68)
Gaubaruva, son of Marduniya	Gobryas, father of Mardonius (VI.43)
Vidarna, son of Bagābigna	Hydarnes
Bagabuxša, son of Dātuvahya	Megabyzus
Ardumaniš, son of Vahauka	Aspathines

There is a only one disagreement: Ardumaniš and Aspathines are clearly two different people. The former is unknown elsewhere; perhaps he perished in the assault on Smerdis. In contrast, Herodotus’s Aspathines is easily recognizable as one of Darius’s companions shown bearing royal arms on the king’s tomb; an inscription calls him Aspacānā (DND).

In any case, the participants in the plot are all clearly descendants of important aristocratic Persian families (the Persian identity of each of them is indicated by Darius), even though we lack precise indication of the ancestry of some of them; their aristocratic origin is known especially from the status that they and their sons held after Darius’s victory. Herodotus (III.68♦) presents Otanes as “one of the wealthiest members of the Persian nobility.” One of his daughters, Phaidime, had been taken to wife first by Cambyses, then by Bardiya (III.68); hence the role attributed to him by Herodotus in the denunciation of the fraud (III.68–69). According to Herodotus (II.1; III.2), Cassandane, the wife of Cyrus, was also Otanes’ sister. Gobryas and Aspathines are also identified by Herodotus as “two eminent (*prōtoi*) Persians” (III.70♦). Moreover, both are depicted on the tomb at Naqš-i Rostam: the inscription (DNe♦) gives Gobryas the title “spear-bearer (*arštibara*) of Darius the king.” The inscription does not give his patronym to identify

him but calls him *Patišuvāriš*, a designation in which we recognize the Patischorians, a subgroup of the Persian people whom Strabo (XV.3.1) lists in a loose way with the Achaemenids and the *magi* among the Persian tribes (*phula*). Whatever the socio-genetic reality of the Patischorians, there is no doubt that their members were indeed among the *prōtoi* of the Persians.

The Problem of Power

The logic of the plot, as it appears in Herodotus and Darius, cannot be denied. The essential problem to be settled was that of power pure and simple. From the beginning, the problem with the desire to eliminate Bardiya was that there was no heir, since Cambyses, as everyone knew, had died without male issue. According to Herodotus, it was not until after the murder of the “*magus*” and his companions that the Seven addressed the issue: “The conspirators met to discuss the situation in detail. At the meeting certain speeches were made—some of our own countrymen refuse to believe they were actually made at all; nevertheless—they were” (III.80♦). Three theses are then presented, defended respectively by Otanes, Megabyzus, and Darius: (a) establishment of a regime where the ‘people’ (*plēthos*) and the ‘great number’ (*pollon*) exercise power; (b) setting up an oligarchic system, whose keystone would be “a group of men chosen from the best” (Megabyzus of course mentions that the Seven would be included); (c) lastly, retaining the monarchic regime. The conclusion of the debate was: “These were the three views set out in the three speeches; the four men who had not spoken voted for the last” (III.83♦).

Like Herodotus’s Greek listeners (cf. VI.43), modern historians have given little credence to putting these speeches in the mouths of the three nobles. Their tone and vocabulary are typically Greek. Are we really expected to believe that the supposed excesses of Bardiya/Gaumata against the nobility had caused a resurgence, from a very distant past, of the aspirations of the chieftains of clans and tribes to govern collectively, in other words, to perpetuate the structure of the conspiracy as it is described by Herodotus? This interpretation seems rather farfetched, since it implies that a number of Persian aristocrats would put at risk the fruits of the conquests from which they had so greatly benefited. It is totally shattered if the reconstruction of events presented (as a hypothesis) in the previous chapter is accepted.

In truth, what was at stake was not really the *monarchic* principle; what was at stake, and what the debate must have dealt with, was a *dynastic* problem. In the absence of a direct heir, who should be chosen? This was the only real question. We know the explanation given by Herodotus: Otanes took himself out of the competition, and the other six nobles decided to let fate make the decision: “They proposed to mount their horses on the outskirts of the city, and he whose horse neighed first after the sun was up should have the throne” (III.84♦). Then Herodotus gives the details of the ruse concocted by Oebares, Darius’s groom, that led his master to be recognized as king (III.85–88). Obviously, no one could believe that Darius’s accession to power was due exclusively to a ruse. The motif of hippomanancy was added afterward because it meshes neatly with the notion Darius wished to propagate—namely, his special relationship with the deity. But it is clear from his other qualities and assets that the son of Hystaspes was obliged to seize supreme power with the consent and support of the other conspirators—unanimous support because, basically, Otanes had also given his consent. His companions thereafter

had no choice but to recognize the supremacy of Darius, which could only be based on intrinsically superior rights and/or a coalescence of forces in his favor.

The “Rights” of Darius

Darius states that he became king because of and under the protection of Ahura-Mazda and because of the antiquity of his familial rights. He presents himself from the start as “son of Hystaspes, grandson of Arsames, an Achaemenian” (DB §1♦). Then he includes his father and grandfather in a sequence going much further back, since it reaches Achaemenes, who is presented as the eponymous founder from whom Teispes and Ariaramnes, father of Arsames and thus great-grandfather of Darius, were directly descended (§2). He simultaneously stresses the antiquity and the distinction of his family: “For this reason, we are called Achaemenians. From long ago we have been noble. From long ago our family (*taumā*) had been kings” (§3♦). And finally he adds: “Saith Darius the King: VIII of our family (there are) who were kings afore; I am the ninth, IX in succession we have been kings” (§4♦). Despite several difficulties in translation, the image Darius wishes to project is perfectly clear. From his viewpoint, there cannot be any disagreement: his right to kingship is rooted in the long duration of the “royal seed,” and the purpose of his action was the restoration of his House (*viθ*) to its ancient foundations (§14).

On many counts, Darius’s claims are insupportable. He does not mention Cyrus, even though he includes Teispes in his genealogy and presents him as his great-great-grandfather; Cyrus calls Teispes his great-grandfather. The only way to harmonize the two genealogies is to suppose that Teispes divided his kingdom into two branches: the first (beginning with Teispes and Cyrus I) represented by Cambyses and Bardiya; the second by Darius through his father, Hystaspes. But, despite Herodotus (VII.11), the theory of two Persian kingdoms will not stand. Certainly, if this theory were accepted, we cannot see who the eight kings to precede Darius might have been; he is careful not to name them! We know in fact that his father and grandfather, Hystaspes and Arsames, were alive in 522 (cf. *XPf* §3) and that they certainly never bore the title of king. If Darius had a Teispes in his family, the only possibility is that it was a man with the same name as the great-grandfather of Cyrus the Great. There is not one text to demonstrate that Hystaspes’ son came from a related line of descent, as is often supposed. Indeed, Plato (*Laws* III.695c) and Aelian (*VH* XII.43) stress that Darius was not the son of a king. This is exactly what Justin suggests (I.10.13–14). Herodotus does not give the slightest hint that Darius had any greater right to the throne than his fellow conspirators. Quite the contrary, he later recalls, using the word *idiōtēs*, that before 522, although he had a prestigious court title (*doryphoros*), Darius was “not yet of any particular importance . . . a person of no power or consequence” (III.139–140♦). By this, he simply means that Darius was not the son of a king; he was an *idiōtēs* [‘private person’] (VII.3).

But making Darius into a “usurper,” as has been customary, does not make much sense either, for the plain and simple reason that none of the other six conspirators— not even Otanes—could argue for the same dynastic credentials that the son of Hystaspes asserted without discussion. Nor is there much sense in objecting that Hystaspes had more “rights” than his son. It seems clear that, given the occasion of a dynastic vacancy, Darius wished to claim a new foundation for the Persian kingdom and Achaemenid dominion. Therefore, he chose an eponymous ancestor, Achaemenes, which justified his rights a posteriori. It was probably on this occasion that a new “founder legend” was introduced,

the legend in which Achaemenes was said to have been fed and raised by an eagle (Aelian, *Anim.* XII.21), an animal whose connections with royal Persian power are well attested. As for the word *Achaemenid* itself, it is clear that Darius uses it in a very narrow sense. For him it does not refer to a clan—which is how we understand Herodotus's *phratries*. It is a name that applies exclusively to the members of Darius's patrilineal family. It is also in this sense that the new king used the word in the fraudulent Pasargadae inscriptions supposedly created by Cyrus (CMA-b-c = DMA-b-c). By describing Cyrus quite simply as "king" and Achaemenid, Darius was trying to mask his familial manipulations by making Cyrus the fictive ancestor of the new royal family. Here the term clearly referred to the royal family, for we cannot see what Darius would have gained by stressing that Cyrus belonged to the clan/phratriy of the Achaemenids.

It is thus totally useless to stress that a man like Otanes would have had as much right as Darius because his father, Pharnaspes, is called "Achaemenid" by Herodotus. Aside from the fact that Herodotus's information is absolutely demolished by the Behistun inscription (§68: Thukra), for Herodotus and Darius the term *Achaemenid* designated different social realities. For Herodotus, it referred to the Achaemenid clan, which was part of the Pasargadae tribe. This is, moreover, the sense in which he described Darius's father as Achaemenid (I.209). In contrast, Darius used the term exclusively to refer to his ancestry in the direct line. As Aelian implies (*Anim.* XII.21), it is by reference to this familial-genetic reality that one must evaluate the nobility (*eugeneia*) of the various Persian families from this time onward. That is, "nobility" was no longer merely a matter of genealogy: the category was thereafter inserted into the political—or, if you like, dynastic—vocabulary.

In other words, Darius did not come into power because of his dynastic ancestry. Quite the converse is true: as a result of the power that he arrogated to himself, he established the dynastic rights of his ancestors. It is not because he was Achaemenid (in the clan sense) that Darius achieved power; it was his accession to royalty that allowed him to redefine the reality of what it meant to be "Achaemenid." At the same time, this redefinition did not wipe out the earlier understanding; it seems clear that the Achaemenid clan continued to function as in the past. But it is also clear that membership in this clan was not enough to claim any sort of right of succession. This decision remained solely in the hands of the "head of the family"—in other words, the reigning king. It was thus the very bases of dynastic reality that Darius modified from top to bottom, as well as the special themes of dynastic ideology, which he did more to manipulate than to restore. It is therefore entirely pointless to judge Darius's candidacy for the throne in terms of a right of succession that he in fact redefined *after* his accession.

The Primacy of Darius

At this point in the discussion, it seems useful and sensible to leave the realm of ideology and propaganda behind. But to decline argument on the terms imposed on posterity by Darius is to find ourselves back at the question posed at the beginning: why, of the seven conspiring nobles, was it the son of Hystaspes who was eventually chosen? It hardly seems legitimate to attribute much credibility to the premonitory dream of Cyrus recorded by Herodotus (I, I.209), which implies that as early as 530 Cyrus feared a revolt by Darius, the son of Hystaspes. If, moreover, we abandon speculation on the "nobility" of his origins, there are other explanations that are worth exploring. It must be assumed that Darius operated from a position of strength, imposed or negotiated. Indeed, contrary

to appearances, Herodotus does not at bottom distance himself from the implications of Darius's own statements on this point. Herodotus's phrasing (III.70) and the story of the formation of the conspiracy indicate that from the outset Darius held a special position among the conspirators. Before his arrival, in fact, an organizational chart of the conspiracy could have been diagrammed as a pyramid, drawn up according to the order of appearance on the scene of the first six conspirators, as seen by Herodotus:

The schema leaves out Darius, who came later. He was then integrated into a conspiracy formed by the heads of six great families without having been recruited personally either directly by Otanes or at a lower level by Aspathines or Gobryas. To put it another way, he was not personally dependent on the other conspirators, particularly not on Otanes. In other words, from the moment of his appearance he occupied a position of strength equal to that of Otanes.

The other observation—a more important one—is that representatives of Darius's family were part of Cyrus's and Cambyses' circle of intimates. According to Herodotus (III.70), Darius's father, Hystaspes, was "governor of Persia" in 522. But this is certainly an error: the Behistun text shows that he held a high military command in Parthia at the time (DB §35). It was perhaps in this capacity that he was part of Cyrus's entourage at the beginning of his final campaign in Central Asia (Herodotus I.209). The career of Darius himself is interesting, to the extent that we can reconstruct it even very imperfectly from remarks in the Classical authors. According to an author who is late but in general well informed about Persian matters, Darius "carried the quiver (*pharētophoros*) for Cyrus" (Aelian, VH XII.43♦). We also know that he accompanied Cambyses on his Egyptian expedition, since Herodotus places him there in a well-known story. Herodotus states that at this date Darius "not yet of any particular importance,"♦ an evaluation that only makes sense in contrast to his position as king, his position when Herodotus first introduces him in the course of his narrative. The author from Halicarnassus states, in fact, that in Egypt Darius had the title "lance-bearer (*doryphoros*) of Cambyses" (III.139). "Lance-bearer" and "quiver-bearer" must be considered not so much duties as court titles by which a king wished to demonstrate the distinction he bestowed on one of his faithful. It was precisely this custom that Darius observed when he placed Aspathines and Gobryas near him on his tomb at Naqš-i Rostam (DNe-d). In other words, Darius had acquired first-rank political stature when he seized supreme power in 522. Born around 550, he was able to make a name for himself during the reign of Cambyses.

But the problem remains. That Darius was not a "self-made man" is one thing (and this, after all, is open to question); that he was to become king is another. In a developing situation like that of spring 522, it was within the council of Seven that the decision was made. But to go beyond this simple observation, it would be useful to be familiar

with the inner workings of the group of Seven. Though they came together for the purpose of overthrowing Smerdis, it is also true that there already was a personal and familial solidarity among them, a solidarity that the available evidence allows us to glimpse faintly in the case of one of the conspirators, Gobryas. The privileged relationship between Gobryas and Darius is illuminated by the place the new king reserved for him on the façade of his rock-cut tomb at Naqš-i Rostam, where he appears as royal lance-bearer (*arštibara* = *doryphoros* [DNC]). Indeed, we know from Herodotus that before ascending the throne Darius had married Gobryas's daughter, who bore him three sons. The oldest son was named Artobarzanes (VII.2), and another was named Ariabignes (VII.97). Gobryas at an unknown date married a sister of Darius, who bore him Mardonius (VII.5). These wife-exchanges cemented a solid family alliance. We may also point out that, in a tradition recorded by Herodotus, Gobryas was Darius's closest and strongest supporter. He took the floor to second Darius's initial proposals (III.73) and he participated directly in putting the *magus* to death (III.78). Furthermore, Gobryas was among the four co-conspirators who approved Darius's "constitutional" proposals (III.83). Keeping in mind the Greek garb in which Herodotus's report appears, we understand that Gobryas and three other conspirators (Intaphernes, Hydarnes, Ardumaniš) supported Darius's royal claims from the beginning, and the other two (Otanés and Megabyzus) did not interfere. In fact, Otanés then chose to remove himself from the royal competition.

The Elimination of Bardiya

To make headway, we must become familiar with the practical considerations that led to the execution of Smerdis. All of the ancient authors insist on the fact that the Seven acted alone, personally facing with weapons in hand first the guards, then Smerdis and his companions. It seems improbable, however, that access to the king was defended only by a few guards at the gate and a few eunuchs. Herodotus, who incorrectly places the scene in the palace at Susa, composed his tale from heroic motifs, which he later repeated in his passage on Intaphernes' revolt (III.118). Certain parallels with other revolts suggest instead that there was in fact a pitched battle. This implies that the Seven had troops at their disposal. The later example of Intaphernes leads us to think that each of the Seven had gathered the people of his House (*oikos* = *viθ*), sons and relatives, around him (cf. III.119). My hypothesis, then, is that for reasons that probably relate to the state of his prior preparations, Darius would have had the most numerous and best seasoned "contingent."

At this point in the discussion, it is useful to set aside the tales of the Classical authors and return to Darius's version. To be sure, it is convenient and justifiable to distinguish the portion of the Behistun inscription devoted to the revolt of Gaumata from the long discussion dedicated to the "nineteen battles" with the nine liar-kings that Darius claims to have won "in a single year." Gaumata is separate from the rest of the kings, who are represented with ropes around their necks before the Great King: he lies at the feet of the Great King, who sets his left foot and his bow on Gaumata's body. Nothing else about him appears except that he is in the list and the victory won over him is apparently reckoned among the nineteen battles. Darius writes: "I with a few men slew that Gaumata the Magian, and those who were his foremost followers. A fortress by name Sikayauvatiš, a district by name Nisāya, in Media—there I slew him" ♦ (29 September 522). Darius's tale is thus rather different from Herodotus's, which places the scene in

the palace of Susa, or Ctesias's, which claims that the rebel was in bed with one of his Babylonian concubines at the time! If we follow Darius and believe that Gaumata won over a part of the population to himself, then we must doubt that his elimination could have been accomplished simply by a murder in the bedroom of a badly defended palace. It seems more likely that the physical elimination of the rebel was the result of a lost battle, after which Gaumata took refuge in a Median fortress. That is, we can imagine a scenario identical to that of other revolts: a battle, the flight of the vanquished to a fortress, and the execution of the rebel and a few dozen of his associates. If this scenario is valid, the council of the Seven, to whose debates Herodotus limits himself, was nothing other than the general staff who knew they could count on an army capable of doing battle with the forces that were undoubtedly available to "King Bardiya." If this is the case, it must be recognized that, after the death of Cambyses, Darius already held a well-established position that allowed him to take command of certain contingents that he would later call "the Persian and Median army that was with me" (*DB* §25). This hypothesis implies that Darius had planned his violent coup well in advance, at least from the time of the death of Cambyses several months earlier. Perhaps he was among the Achaemenids at Cambyses' deathbed who heard the suffering king exhort them to do battle with the usurper (*III.65*). It was probably there, or on the road back, that the plot against Bardiya was hatched, the plot that Bardiya attempted to counter by confiscating the property of nobles supporting it (pp. 103ff.). Unfortunately, we have no precise information about the period between the death of Cambyses and the elimination of Gaumata/Bardiya, apart from a few allusions in one of the inscriptions of Udjahorresnet (Posener, no. 1E), who reports that he accompanied Darius in Elam. The new king sent him back from Elam to Egypt. Udjahorresnet would have us understand that, after Cambyses' death, Darius was in charge; but it seems difficult to ascribe too much value to this statement.

A Remark on Method

The comparison of Herodotus and Darius does not bring fully to light an affair that was probably simpler than either of them would have us believe. Once the propagandistic distortions of the new king have been carefully bracketed, his version is far more useful than Herodotus's. The tale of the historian from Halicarnassus is marked by a whole series of literary motifs that he probably wove into a pattern that in turn was built on a series of versions circulating in his time in Asia Minor, or even Greece. The very framework of Herodotus's tale is scarcely credible: a conspiracy of seven aristocrats (the figure 7 is already suspicious), elimination of the *magus* by the Seven, "constitutional" debates, and the selection of Darius by resorting to hippomanancy—in all seriousness, not one of the narrative elements presented by Herodotus can hold the attention of a historian for long. New views can only come from a better comprehension of Darius's statements reconsidered in the context of dynastic history.

2. Revolts and Reconquests (522–518)

The Liar-Kings

"This is what I did after I became king": this is how Darius presents his work of "dynastic restoration" (*DB* §10 and 15♦). Herodotus notes, "In this way Darius became king of Persia" (*III.88♦*). Then, after recalling the marriages Darius contracted and the erec-

tion of an equestrian statue, Herodotus turns directly to an account of tribute reform (III.98), which is incorporated into an extensive discussion of the extent of the territories over which the Persian king held sway (III.98–117). Next, he turns to the elimination of Intaphernes (III.118–19) and the revolt of Oroetes (III.120–29). In contrast, he is totally silent about other events of the greatest importance, the revolts of the subject peoples, to which Darius devotes the greater part of his statement at Behistun (§§16–57; V §§71–76). Actually, Herodotus was not unaware that the appearance of Darius ushered in a “time of troubles” (III.126–27, 150). But, for reasons that escape us, he did not see the need to grant the subject much space. Aside from the story of a Babylonian revolt, he makes a single brief allusion to the revolt of the Medes (cf. I.130), who, his informers told him, had already inspired the revolt of the “magus” (cf. III.65, 73, 126). The other Classical authors are all equally silent. It is thus to the Behistun inscription that the historian must turn. We have not one version, but four. Along with Elamite (the first to be inscribed), Babylonian, and Persian versions, there is also a badly damaged Aramaic copy, found in Egypt. On the whole, the versions agree, but they also offer a number of differences. The historian is fortunate to have the comparison, for this or that version includes pieces of information that are not found elsewhere. Thus, only the Babylonian and Aramaic versions give the number of people killed and taken prisoner among the rebel armies.

According to Darius’s presentation, the earliest revolts broke out in Elam and Babylonia after the elimination of Gaumata. In Elam, Açina, son of Upadarma, seized power; in Babylonia, the tablets attest that the revolt of Nidintu-Bêl did take place by the beginning of October 522, when he was recognized as king of Babylon under the name Nebuchadnezzar, presenting himself as the son of Nabonidus. While the first revolt was put down without much difficulty (§16), the second was not. At the head of the army, Darius crossed the Tigris, then the Euphrates, inflicting two successive defeats on the rebel Nidintu-Bêl before capturing him and putting him to death (18 December 522; §§18–20). At this point, Darius enumerates the countries that revolted while he resided at Babylon: Persia, Elam, Media, Assyria, Egypt, Parthia, Margiana, Sattagydia, and the Saka of Central Asia (§22). The tale of the victories won by Darius and his lieutenants follows.

The historical use of the Behistun inscription poses a number of problems. If we go by the list of rebellious countries cited by Darius, the revolts embraced the entire Empire from the Mediterranean to the Indus, from the Syr Darya to Babylonia and Elam. But we are not equally informed about all of the fronts. Darius speaks primarily of the troubles in three major regions: Persia and Media, the Iranian Plateau and Central Asia, and Elam and Babylonia. In contrast, he is uncharacteristically laconic about the western regions. We learn from Herodotus that there were troubles in Asia Minor, but these involved the insubordination of a Persian satrap (Oroetes), not a Lydian revolt properly speaking, even though the satrap’s administration had previously disaffected part of the population (Diodorus X.16.4). The king is also silent about a rebellion in Egypt, although he alludes to it in his enumeration. It is possible that a local dynast, Petubastis, revolted in 521, and disappeared a few months later, doubtless shown the error of his ways and executed by the satrap Aryandes. It has sometimes been thought that troubles also arose in Judah in concert with the Babylonian revolts. But the prophetic texts adduced for support must be read with care. We might think it unlikely that the Jews, just

fifteen or so years after their difficult and harsh return, would have had the men and energy needed to contemplate seriously the restoration of the ancient monarchy for the benefit of Zerubbabel.

It is the chronological aspects that remain most problematic. Each victory is precisely dated to the month and day within the year. But it is not always easy to identify the year. Several times, Darius boasts of having won nineteen victories in a single year. The meaning of this expression continues to be debated. There is hardly any doubt that the repetition of this ideological theme, well known from elsewhere, is first of all meant to magnify a triumphant king. Darius is certainly not overly modest, inasmuch as he proclaims: “Those who were the former kings, as long as they lived, by them was not done thus as by the favor of Ahuramazda was done by me in one and the same year” (§59♦). But at the same time, Darius denies exaggerating or falsifying reality:

I turn myself quickly to Ahuramazda, that this (is) true, not false, (which) I did in one and the same year. . . . By the favor of Ahuramazda and of me much else was done; that has not been inscribed in this inscription; for this reason it has not been inscribed, lest whoso shall hereafter read this inscription, to him what has been done by me seem excessive, (and) it not convince him, (but) he think it false. (§§57–58♦)

Because the military operations played out on several fronts at the same time, the compilers of the inscription did not follow a chronological plan. They envisaged the confrontations on a regional basis: Elam and Babylonia (§§16–23), Media, Armenia, and Sagartia (§§24–34), Parthia-Hyrcania (§§35–37), Margiana (§§38–39), Persia (§44), Arachosia and Sattagydia (§§45–51), summary (§§52–53). The order in which the liar-kings are represented on the Behistun relief, however, appears to be chronological (Gaumata [Persia], Açina [Elam], Nidintu-Bêl [Babylonia], Fravartiš [Media], Martiya [Elam], Ciçantakhma [Sagartia], Vahyazdâta [Persia], Arkha [Babylonia], Frâda [Margiana]). But even so, there remain several debates, particularly regarding the date of the elimination of Frâda (December 522 or December 521?).

The Victories of Darius and His Lieutenants (522–521)

The multiplicity of fronts is stressed by Darius himself, doubtless to further exalt the valor of his final triumph: “While I was at Babylon {mid-December–mid-January 521}, these are the provinces which became rebellious from me” (§21♦). A list of nine countries (*dahyâva*) follows. In this framework, maneuvers on a grand scale were carried out on fronts sometimes at great distances from each other. Victories were won by Darius’s armies a few days apart, or even on the same day: on 15 July 521, the Median general Takhmaspada wiped out a rebel in Sagartia (near Media), and another general, Artavardiya, reconquered Vahyazdâta in Persia. In December 522–January 521, Darius and his lieutenants needed to extinguish numerous brushfires: in the second half of December 522 alone, there were two victories by Darius in Babylonia, the putting down of a rebel in Elam, and another victory in Assyria, not to mention the victory over Frâda of Margiana, if it is actually to be dated to December 522. Nevertheless, Darius cites only the pitched battles. In point of fact, we should probably imagine a campaign characterized by a series of skirmishes.

Even though he presents all the victories very personally (“By the power of Ahura-Mazda, my army wiped out the rebel army”), it is quite clear that the king did not personally lead the operations every time. He was present to put down the Babylonian

revolt in December 522, and it was clearly from Babylon that he gave the order to execute the Elamite rebel Āçina. It was at Babylon that he received dispatches from the various fronts and determined his responses. He sent orders to Vivāna, his satrap in Arachosia, to attack the troops sent there by Vahyazdāta, who had taken power in Persia in the name of Bardiya. At the end of December 522, his lieutenant, Vaumisa, won a battle in Assyria over the Armenian rebels, and the next January 12, the Persian Vidarna—dispatched from Babylon—was victorious in Media.

In mid-January 521, Darius left Babylon and decided to establish his general headquarters in Media, where his lieutenants were encountering major difficulties. The Median rebel Fravartiš had clearly achieved some success there and was extending his operations toward Parthia-Hyrcania. Shortly afterward, Vivāna won a second victory in Arachosia (21 Feb.), and Hystaspes, father of Darius, conquered Fravartiš's partisans in Parthia-Hyrcania (8 March). Darius faced the Median chief in person and won the victory (8 May). Following this victory, Darius set himself up at Ecbatana, where the rebellious Median king soon was brought before him after being captured at Rhagae in Media (mid-May). For several months, Darius had to coordinate operations on several fronts. The Armenian rebellion was still going on in June 521, despite several victories won successively by Vaumisa and Dādarši, satrap of Bactria. Several days later (in July), the Sagartian rebel was eliminated, and then the last few outbreaks of revolt in Parthia-Hyrcania were quashed. During this time, Vahyazdāta pursued his offensive in Persia and was halted in mid-July. The king (who had meanwhile returned to Persia) could not relax his efforts; in August 521, the Babylonians rebelled again, under the leadership of Arkha, who took the title King of Babylon. Darius sent an army to Babylon under the leadership of Hydarnes (1 Sept.), who was victorious on 27 November. Finally, if the revolt of Frāda of Margiana is to be dated in 521 (and not in 522), it was at the end of December that Dādarši brought it to an end. It was then that Darius ordered the relief and inscription to be carved on the cliff at Behistun (in their original version), where he could proudly proclaim: "This is what I did by the favor of Ahuramazda in one and the same year after that I became king. . . . These IX kings I took prisoner within these battles" (DB §§52–53♦).

The Victories of Darius: A Military Evaluation

Despite the triumphalist character of Darius's proclamations, the gravity of the crisis must not be underestimated. The trial that Darius and his followers survived serves to reveal anew the strengths and weaknesses of the Empire built by Cyrus and his son. What kind of assessment can be made?

Answering this question is no simple task, for the very character of the account inscribed at Behistun defeats any attempt at useful analysis by its one-sided report of the accumulated victories at the expense of any notice of the defeats or an occasional reverse. It is thus difficult to confirm that at the end of 521 all of the fires of revolt had indeed been snuffed out. We may note, for example, that there is no explicit mention of a definitive defeat of Armenia/Urartu. Dādarši defeated the Armenians three times, but obviously none of these victories was decisive, because he waited in Armenia for the arrival of the royal Median army (§28). Another army, led by Vaumisa, beat the Armenians twice more and then in turn waited for Darius to come from Media (§§29–30; *DB Bab.* §24). Since it is not cited separately in the list of rebel countries (§21), Armenia's revolt

probably was implicitly considered to be organically linked to the revolt of Fravartiš in Media. Nor is Armenia mentioned in the general recapitulation (§52), and there is no Armenian "Iar"-king in the relief. In short, it seems risky to take literally the results of the "pacification," as it is triumphantly described by Darius. An attitude of reserve is all the more justified because in the following year (519) Elam revolted anew, and Darius himself had to lead an expedition against the Saka of Central Asia (V §§71–74).

A simple fact must be underscored at the outset: Darius and his generals in a few months put out several fires of rebellion. On the level of direct results, we may say that the royal and satrapal armies demonstrated their superiority, though even this statement is problematic. Several times, Darius states that he drew various units of his forces from "the Persian and Median army." This doubtless refers to the army of Cambyses, minus the contingents sent to Egypt by the tribute-paying countries. Moreover, Darius could count on his troops to remain loyal. This was even true in Media, where only a minor part of the Persian and Median army refused to engage the rebel. Furthermore, he was able to enlist new soldiers in the course of his victories.

The other figures we possess are the numbers of rebel casualties that are given in the Babylonian and Aramaic versions.

Country	Battle	Killed		Captured	
		DB Bab.	DB Aram.	DB Bab.	DB Aram.
Persia	Rakkha	4,404	35,404 (?)	2...?	??
	Parga	6,246	4,464?		
Media	Maruš	3,827?	5,827?	4,329	4,329?
	Kunduruš	34,425?	[34,42]5	??	1,801[.]
Parthia	Višpauzathiš	6,346		4,346?	
	Patigrabana	6,570		4,192	
Margiana		552.?	5]5,24[3	2.?	6,972
Armenia	Tigra	546	504[6]	520	[520]
	Uyama	427	427	525?	[0]02
	Izala	2,034	2,034		
	Autiyara	2,045	[2,04]6	1,588??	1,578

Some of the figures are impressive. But the problem, as we can see, is that the readings of the figures are far from certain and their interpretation is difficult and even risky. Only one statistic for an army is given in the Babylonian version: the army commanded by the satrap of Arachosia, Vivāna, after winning the second battle against Vahyazdāta's lieutenant is reported to number 4,579 men. We learn elsewhere that the king entrusted an army corps to Hydarnes for putting down the Median rebellion and that this army corps "smote that rebellious army exceedingly" (§25♦). Of course, according to the Babylonian version, the Median losses after this battle (the battle of Maruš) amounted to 3,827 killed and 4,329 captured, which demonstrates that the total of the rebel army was much larger. The best evidence is that Hydarnes thereafter preferred to wait in prudent readiness until the arrival of Darius, whom he would later join near Behistun. Thus either the decisive "victory" was nothing more than an uncertain engagement (or even a defeat),

or else the figures in the Babylonian version must be treated with caution. At any rate, the two interpretations are not mutually exclusive. It is proper to consider Darius's propagandistic intent: he loves to repeat that he overcame numerous powerful revolts with an army that he describes several times as "small." It seems clear that the main part of the force remained under Darius's direct command and that he used it to regain Babylonia (October 522–early January 521). As a consequence, he was sending out army units of only a few thousand men under the command of his lieutenants. It is likely that the victory over Phraortes of Media (May 521) was of decisive strategic importance, considering the effect of this battle (the battle of Kunduruš) on the Median rebel army (see the table). It is likely that the securing of the northern front in May–June allowed Darius to redeploy troops against Vahyazdāta in Persia.

If in the end Darius defeated all of the armies that had allied against Persian power, it is apparently because there was no real unified plan for opposing the royal armies. Isolated, some of the rebels were quickly defeated. The first insurgent in Elam, Āçina, surrendered after the dispatch of a message from the king, and the second received no local help. Impressed by the mere approach of the king (Darius says), the Elamites seized their "king" and put him to death themselves. In contrast, other revolutionaries offered long and stubborn resistance. The Armenian insurgents were able to survive five battles in six months; Fravartiš of Media resisted for five months; and Vahyazdāta of Persia was not captured until seven months had passed and two battles were fought in Persia itself.

This is not to say that there was no interregional cooperation; quite the contrary. It is precisely cooperation that helps explain the danger presented particularly by the Median and Persian revolts. One of the dangers was that these revolts prevented Darius, in the beginning at least, from raising fresh troops in these two countries that constituted the base for Achaemenid conscription. Moreover, Fravartiš took command of the Median army stationed in the country (§§24–25), and Vahyazdāta assembled "the Persian army which (was) in the palace" (§40♠). Then, after an initial defeat at Rakha, Vahyazdāta raised a new army at Paišiyauvādā, near Pasargadae (§42). What is more, neither of these rebellions was geographically limited to Media or Persia proper. Vahyazdāta tried to nibble at the eastern part of the Iranian Plateau by sending an army against Arachosia. This offensive and the troubles in Sattagydia (a region located between Arachosia and Gandhara) threatened Achaemenid power on the southern Iranian Plateau as far as Carmania (late 522–early 521). The case of the revolt of Fravartiš in Media is even clearer. In Sagartia, the rebel chief claimed, like Fravartiš, to belong to the family of Cyaxares, and Darius calls the rebel chieftains of Parthia-Hyrcania "the partisans of Fravartiš." It also seems (as we have seen) that the length of the struggle in Armenia was related to the Median rebellion. Fravartiš held the strategic route from Media to Central Asia for awhile. After his defeat, moreover, he decided to march east, which is why Darius detached an army corps that succeeded in catching up with him and capturing him at Rhagae, near the Caspian Gates. Darius understood the danger well: it was the reason he quickly moved to establish himself in Media (January 521)—so that he could coordinate the counteroffensives and prevent Fravartiš from cutting off his communications with Central Asia. It is perhaps because of the importance of the revolt of Fravartiš that Herodotus highlights the Median uprising when he discusses the subjection of Ecbatana by Cyrus: "At a later period [the Medes] regretted their submission and revolted from Darius, but were defeated and again reduced" (I.130♠; cf. Diodorus XI.6.3).

The Political Aspect of the Revolts

Defining the origins and causes of the revolts is especially problematic. The most noteworthy observation is that the various ringleaders all had dynastic aspirations. Each took the title “king”: Ācina proclaimed himself “king in Elam,” Ciçantakhma “king in Sagartia,” Frāda “king in Margiana,” etc. In most cases, the rebels took a regnal name that permitted them to connect with the local dynasty that had been erased by Cyrus: in Babylon, Nidintu-Bēl called himself “Nebuchadnezzar, son of Nabonidus”; Fravartiš claimed that he was “of the family of Cyaxares [Uvaxštra],” like the Sagartian rebel. The desire to stir regional sentiments is evident. Even foreigners such as the Persian Martiya in Elam or the Armenian Arkha in Babylon sought to turn the assertion of dynastic continuity to their profit. This choice reflected a clear political intent to resume the course of local history and close what was by implication only a parenthesis of Achaemenid dominion. At Babylon, in fact, for several months private documents were dated to the accession year and first regnal year of a King Nebuchadnezzar (III or IV), and in Persia to the reign of Vahyazdāta/Bardiya (but this may refer to the first Bardiya).

Unfortunately, it is difficult to estimate the popular impact of these manipulations. The impact apparently was not very significant in Elam, where neither of the two “kings” was in a position to raise an army. On the other hand, the recurrence of revolts in the same region (Elam or Babylonia, in particular) suggests that the integration of conquered territories into the Achaemenid Empire was still very imperfect. Until Darius, Susa also remained exclusively Elamite in character. But, generally, we lack information on the breadth and depth of the rebellions. Some historians think that on the basis of the number of people killed and captured—about 100,000 in all—they can draw conclusions regarding the popular and national character of several uprisings. Even setting aside the uncertainty of the readings, the totals for casualties in Media (nearly 50,000) and in Margiana (55,000 killed and 6,972 captured, according to some readings) are especially noteworthy. But does the extent of the losses indicate that the uprising led the entire population to take up arms in a national and popular revolt or, more simply, does it reflect ferocious repression striking out blindly at civilian populations who remained aloof from the movement? There is little doubt that the Persians resorted to the use of terror: Darius boasts of massacring every survivor of the Babylonian armies that he attacked on the banks of the Tigris and the Euphrates (*DB Bab.* §17). In the end, the fact that the leaders raised troops from among the population says nothing about the “national” character of the movement.

According to Darius, the revolts broke out after his victory over Gaumata (29 Sept. 522; §15). But, for reasons already given, the statement of the new king must be considered in perspective, because discontent was previously evident among the conquered populations. The best proof of this is the measure taken by Smerdis to end tribute and military levies for three years (see above, p. 105). The dynastic difficulties at the heart of the Empire represented the ideal occasion for contesting Achaemenid authority. Without rejecting the reasonable idea that some countries clung to the memory of past grandeur, we are inclined to conclude that the deep source of discontent was the system of tribute—as Smerdis had understood. The revolts were led by the local ruling classes, who had been careful to reserve the profits derived from exploiting land and people for themselves instead of the newly dominant class of Persians. Their discontent also related

to the excessive burden of the levies, as is demonstrated by the complaints of the Egyptians against their satrap, Aryandes (Polyaenus VII.1.7). It is also useful to note that even in the countries where we can assume strong ethnocultural identity, nothing allows us to assume a unanimous anti-Persian sentiment. During the reigns of Cyrus and Cambyses, many local nobles willingly collaborated with Persian power. Let us recall, for example, that Darius was supported by a Persian-Median army and that one of his lieutenants was the Mede Takhmaspada, who led the army to victory against the Sagartian rebel who claimed to be descended "from the stock of Cyaxares." Darius also names the Armenian Dādarši, who supported him in Armenia. In any event, what was the significance of the revolts at Susa and Babylonia led by a Persian (Martiya) and an Armenian (Arkha), respectively?

Darius and Vahyazdāta

One uprising took on special significance, namely, the revolt of Persia. A man named Vahyazdāta raised the standard of revolt, claiming to be Bardiya, son of Cyrus. As Darius notes (§40), this was the second revolt fomented in the name of the family of Cyrus. Vahyazdāta rallied to himself the army that arrived from Aušan and "became king in Persia." Once again, the unstable dynastic situation was at the root of the revolt. Vahyazdāta was defeated by Artavardiya, who had been sent by Darius. Vahyazdāta nonetheless succeeded in raising a second army and sending troops to Arachosia. It was not until mid-July 521 that he was completely defeated; at that time he was taken prisoner and executed in Darius's presence in the immediate vicinity of the future Persepolis.

The origins and methods of this revolt are problematic. Did the new Bardiya receive aid from certain noble families who were disturbed by the advent of Darius, and/or was he principally supported by the peasant class, distressed by the loss of the other Bardiya? To ask the question is to reopen the matter of the first Bardiya's policy. If the theory that makes Bardiya I the spokesman of particular segments of Persian society is unfounded (above, p. 103), there is no reason to accept the social interpretation of the new revolt without reservation. For reasons already alluded to, the successive raising of two armies in Persia provides no solid indication of the sentiments of the Persian population. Darius himself takes care not to attach any particular importance to the revolt of Vahyazdāta, who receives the same attention as the other "liar-kings." Vahyazdāta has no special place on the relief, unlike Gaumata. Darius thus implicitly denies that his dynastic situation was actually endangered by the rebel Vahyazdāta, who is not distinguished in any way from the other liar-kings.

We may rightly suppose that Darius's account is itself suspect. What appears obvious, nevertheless, is that he was able to gather representatives of the Persian nobility and the Achaemenid administration around him. Vivāna, satrap in Arachosia, and Dādarši, satrap in Bactria, acted on Darius's orders with promptness and determination to repel the assaults led by Vahyazdāta's forces (in Arachosia) and Frāda's troops (in Margiana). Perhaps it was the same for Aryandes in Egypt. Darius's father, Hystaspes, was also at hand, and he led the operations in Parthia-Hyrcania. Four of the six co-conspirators of 522 are listed among Darius's generals: Intaphernes, who put down the rebellion of Arkha in Babylonia (Nov. 521); Hydarnes, who fought against Fravartiš in Media (Jan. 521); Gobryas, who was sent to quash a new Elamite rebellion (the next year) (§71); and Otanes himself, shortly after, led an army to the conquest of Samos (Herodotus III.141–49).

The Rebellion of Oroetes

A single satrap refused to aid Darius—Oroetes, who since Cyrus's time had held the post of satrap of Sardis. This high-ranking person had already become famous when, at the end of Cambyses' reign, he eliminated Polycrates of Samos by treachery (III.122–26). Herodotus provides our only information on the repercussions caused by the rise of Darius in the western lands of the Empire:

After the death of Cambyses, and throughout the period when Persia was controlled by the Magi, [Oroetes] had lived in Sardis and offered no help to his countrymen in resisting the Median usurpation. He had, moreover, during these unsettled times, procured the death of Mitrobates, the governor of Dascylium . . . and also of Mitrobates' son Cranaspes, a man hardly less distinguished than his father (*andres en Perseisi dokimoi*). Nor were these two murders by any means his only acts of violence. (III.126♣)

Then Herodotus specifies that Oroetes even had one of Darius's couriers executed on the road back because "what he ordered him did not suit him." The occurrence takes on special interest because it is the first recorded example of insubordination by a satrap.

The date of these events is given with some precision by Herodotus. "The turmoil still lasted," he writes, and "Darius had just come to power." We are thus at the height of the period of revolts. We may assume that Darius, then at Ecbatana (early 521), had ordered Oroetes to march with the available troops, cross the Halys, and bring aid to the royal troops who were encountering many difficulties in the face of the Median and Armenian revolts. Relying on his satrapal guard (1000 Persians), Oroetes chose to ignore the orders and defy the entirely new authority of Darius. Most unwilling to redeploy contingents on a new front, Darius turned to the Persians of his entourage. Herodotus reports that 30 Persians then rushed forward, "each one eager to do his bidding." Bagaesus was chosen by lot. When he arrived at Sardis, he employed a subterfuge to test the loyalty of the guards. Seeing that they displayed a great deal of reverence for some royal letters that he had the secretary open one after the other, Bagaesus unsealed the last of them: "King Darius orders the Persians of Sardis to kill Oroetes." This they did on the spot, and the property of the satrap was confiscated.

Even cleansed of its fictionalized and bombastic tone, Herodotus's tale is very revealing of relations between the new king and the Persians, not just the Persians who surrounded him but also the Persians of the imperial diaspora. Herodotus accents their loyalty, scandalized as they were by the murder of high aristocrats such as Mitrobates and his son. Reading Herodotus's account does not leave us with the impression that Oroetes would have found many Persians at Sardis ready to follow him in his rebellion. For them, loyalty to the monarchy consisted of the desire to preserve all of the privileges that accrued to them from imperial dominion. Indeed, by refusing to aid Darius and the Persians in maintaining order among the subject peoples, Oroetes put at issue not just the authority of Darius but also the edifice erected by Cyrus and Cambyses, which necessitated the existence of a strong, active, and legitimate central authority.

3. The Aftermath of Victory: The Official Story

Crime and Punishment, Publicity and Propaganda

The measures taken against the liar-kings make the dangers faced by Darius as clear as the absolute will of the new king to wipe them out permanently. At his order, Nidintu-

Bēl of Babylon was impaled, along with 49 of his followers (*DB Bab.* §19). After Hystaspes' victory at Patigrabana, he executed the rebel chief and 80 nobles who accompanied him (*DB Bab.* §29). So also in Margiana, where Frāda was put to the sword along with all his followers (*DB Bab.* §31), and in Babylon where Hydarnes impaled Arkha and the nobles who were with him (*DB Bab.* §39). Vahyazdāta and several dozen of his closest allies were impaled in Darius's presence (*DB Bab.* §35). Two revolts received special treatment, both at the time when Darius happened to be in Media. The Sagartian rebel, Ciçantakhma, was sent to him: "I cut off both his nose and ears, and put out one eye, he was kept bound at my palace entrance, all the people saw him. Afterwards I impaled him at Arbela" (*DB* §33♦). Darius is still more expansive about the fate reserved for Fravartiš the Mede: "I cut off his nose, ears, and tongue and plucked out an eye; he was chained under guard at the gate of my palace and everyone could see him there. [*DB Bab.* §25: Then I impaled him at Ecbatana.] As for his trusted lieutenants, I hung them at Ecbatana in the citadel" [*DB* §32; *DB Bab.* §25: "I hung their heads on the walls of the citadel"; *DB El.* agrees with *DB Bab.*]. The intensity of the punishment should not be surprising; it was customary in the Assyrian period and in the Achaemenid as well. Cutting off the nose and ears was the normal form of torture for rebels and usurpers, the Greek authors would note. What should be stressed instead is the publicity that Darius accorded his executions. The entire population was invited to witness the liar-king being tortured at the palace gates. We may recall that, according to Diodorus (XVII.71.6♦), bronze poles, nine meters high, were erected near the gates of Persepolis: "they were intended to catch the eye of the beholder."

This desire to stir the imaginations of the Empire's populations was soon demonstrated again by the new king. He ordered copies of the text inscribed at Behistun to be sent to every country in the Empire (*DB* §70). We now know that the stated will of the king did not remain empty words. At Babylon, fragments of the inscription, parts of what was originally an imposing stela, have been found. Fragments of an Aramaic version of the Behistun text on papyrus have been also been found, this time at Elephantine in Egypt. This is not the original copy sent by Darius to Egypt but probably a student copy, written during the reign of Darius II (422–405), proof that the text continued to be transmitted, even in the form of schoolwork. But access to the royal account was not limited to the literate. At Babylon, a fragment of a copy of the Behistun relief has been discovered, and another tablet has been found at Susa that shows traces of what may be part of another copy.

We may presume that the reliefs and stelas were placed in prominent locations in each satrapy. No doubt the reproductions were protected in the same way as the originals. Addressing those who viewed the monument, Darius adjures them not to destroy the inscriptions or the sculptures; he invokes prosperity for those who protect it and misfortune for those who destroy it (§§65–67). It is clear that by publishing the inscription in all parts of the Empire Darius wished it known to everyone everywhere that he was the uncontested Great King. Again addressing the visitor, he assures him of the absolute truth of his exploits and declares: "Now let that which has been done by me convince thee; thus to the people impart, do not conceal it: if this record thou shalt not conceal, (but) tell it to the people, may Ahuramazda be a friend unto thee, and may family be unto thee in abundance, and may thou live long" (§60♦).

Truth and Lies at Behistun: Darius and Ahura-Mazda

Immediately after his victories of 522–521, Darius decided to engrave the story of his rise and his military exploits on rock. He chose for this the cliff at Behistun, which dominates the plain of Kermanshah, a short distance from the highway that leads from Babylon to Ecbatana (Diodorus XVII.110.5) on a plateau with an elevation of more than 1,000 meters. The cliff must have been a holy place for a long time, doubtless reused by the Persians to their advantage, since the ancient authors stress that the Persians worshiped their gods in open air in high places. It is probably for this reason that the mountain was named Bagistana, Iranian **Bagastana* the 'abode of the gods'. According to Ctesias (cited by Diodorus II.13.2♦), the mountain was dedicated to Zeus, by which he surely meant Ahura-Mazda and/or other Persian and Iranian gods. Ctesias, who describes the journey of Semiramis from Babylon to Ecbatana, adds the following details:

And when she had arrived at the mountain known as Bagistanus, she encamped near it and laid out a park, which had a circumference of twelve stades [2 km] and, being situated in the plain, contained a great spring by means of which her plantings could be irrigated. The Bagistanus mountain is sacred to Zeus and on the side facing the park has sheer cliffs which rise to a height of seventeen stades [3000 m]. The lowest part of these she smoothed off and engraved thereon a likeness of herself with a hundred spearmen at her side. And she also put this inscription on the cliff in Syrian letters. . . ."

It is clear that Darius lurks behind this description of Semiramis; Diodorus alludes very clearly (though imaginatively) to the relief and inscription of Behistun. When Alexander made a special trip to visit the place, he and his companions were struck by the fruitfulness of the plain located at the foot of the cliff: "A magnificent country covered with fruit trees or rich in everything which makes for good living," comments Diodorus (XVII.110,5♦). Inasmuch as Cyrus had already created a paradise at Pasargadae, we are strongly inclined to think that the paradise at Behistun was a creation or a reconstruction by Darius himself, who wanted to give the monument erected to his glory the surroundings he thought it merited. We know in any case that early in 521 Darius was on the plain and that there he met up with the army of Hydarnes (DB §25). It seems quite likely that it was in the course of his long stay in Media (January–June 521) that Darius and his advisers worked out the plans for a monument where he might exalt the total triumph, both dynastic and military, that was at hand. Inscriptions and relief were meant to represent the act of founding a new kingdom, a reborn empire. To this end, whatever models might have inspired the king and his advisers, it is clear that to their way of thinking it was not to be dependent on any existing monument; rather, it was to be an entirely new creation in which the borrowings were melted down and recast into a new work of art in service of a power for which no comparable precedent could be named. The monument takes on even greater importance as the sole narrative composition in all of Achaemenid art and as the first act ordered by Darius after his victory (fig. 8).

Carved on a smooth surface 3 × 5.5 meters, the relief pictures Darius, facing right, dressed in a Persian robe, with a crenellated diadem on his head. In his left hand he holds a bow, which rests on his left foot. His right hand is raised to the level of his face, palm outward. Above his head, in a rectangular panel, is inscribed his titulature: "I am Darius the Great King, King of Kings, King in Persia, king of countries (*dahyāva*), son of Hystaspes, grandson of Arsames, an Achaemenian" (DBa). In front of him, joined by ropes around their necks, hands tied behind their backs, eight liar-kings are depicted.

Fig. 8. Relief at Behistun.

They are differentiated by their clothing and, more clearly, by short inscriptions naming them, repeating the phraseology adopted by Darius in his recapitulation (DB §52): "This is Āçina, an Elamite who lied" (DBb-k). From left to right we can spot Āçina, Nidintu-Bēl, Fravartiš, Martiya, Çiçantakhma, Vahyazdāta, Arkha, and Frāda. The inferior status of these persons is expressed not only by their posture but also by their height: 1.17 m, versus 1.72 m for Darius. But one of the liar-kings is in a position far more humiliating, namely Gaumata, who is lying on his back, hands raised in supplication to Darius, who stands over him in all his dignity and places his foot on his chest.

The relief clearly illustrates the inscriptions that are arranged all around it. It is not at all realistic in the full sense. Gaumata is portrayed as if Darius had already won the title of king before he killed him. The presence of all the liar-kings in front of Darius is intended to represent the king as the personal conqueror of each of them. This does not correspond to the reality expressed in the inscriptions: Martiya was executed by the Elamites themselves, Frāda by the satrap Vivāna, and Arkha by Vidarna/Hydarnes (on the order of the king, to be sure). But, above all, the relief makes no reference to the ways in which the liar-kings were tortured. The primary intent is to represent the king in his capacity as "conqueror," in the form of a message that is simultaneously both metaphorical and realistic.

All of these men are condemned as "liars." By "lying," they violated the law of kings as defined by Darius when speaking of the 23 subject countries, which he had just enumerated (§6):

These are the countries which came unto me; by the favor of Ahuramazda they were my subjects (*bandaka*). They bore tribute (*bāji*) to me; what was said unto them by me either by night or by day, that was done. Saith Darius the King: Within these countries, the man who was loyal, him I rewarded well; (him) who was evil, him I punished well. By the favor of Ahuramazda, these countries showed respect toward my law (*dāta*); as was said to them by me, thus was it done. (§§7-8⇨)

In contrast, all of these false kings "lied to the people" by claiming to be sons of Cyrus or Nabonidus or descendants of Cyaxares. In the concept of power expressed for the first

time at Behistun, the 'lie' (*drauga*) is directly connected with the revolt against established, legitimate power. Thus, "when Cambyses had gone off to Egypt, after that the people became evil. After that, the Lie waxed great in the country, both in Persia and in Media and in the other provinces" (§10♦). And, further on, in column IV, Darius repeats: "These are the provinces which became rebellious. The Lie made them rebellious, so that these (men) deceived the people" (§54♦), and he warns: "Thou who shalt be king hereafter, . . . the man who shall be a Lie-follower, him do thou punish well" (§55♦; cf. §64). Darius presents himself as a man who does not lie and who has never lied, and he guarantees it by invoking Ahura-Mazda (§§56–58). The lie (*drauga*) is implicitly opposed to the truth (*arta*), and both terms belong equally to the political and the religious domain—if indeed Darius and his people could ever have distinguished and separated the political from the religious.

There is a figure, placed above the scene, who plays a primordial role. This bearded individual emerges from a winged disk, is clothed in the Persian style, and wears a tall cylindrical headdress, itself topped with a six-pointed star. He holds a ring in his left hand, apparently offering it to Darius. It is currently understood to be a representation of Ahura-Mazda, the god who guarantees the kingdom to Darius by his power and protection and to whom he owes all his victories—this is what Darius incessantly affirms. He is the only individual with whom Darius establishes a dialogue. It is in fact toward the god that Darius raises his hand, as if to receive the ring Ahura-Mazda holds in his left hand. This is a motif well known earlier in Near Eastern royal art: what we see at Behistun is an investiture scene. Darius rightly could exclaim: "It is thanks to Ahura-Mazda that I am king. . . . It is Ahura-Mazda who has granted me the kingdom [or: conferred power on me]." The illustration thus strongly expresses the fact that, without being a god himself, the king is invested with royal power by the god and is Ahura-Mazda's proxy on earth, as the result of a genuine pact they had concluded. Ahura-Mazda is literally the king's god. This is a reality that Darius himself expresses perfectly in his inscription. Ahura-Mazda's name occurs 63 times, but the "other gods that exist" are mentioned only once, in a subordinate form: "This which I did, in one and the same year by the favor of Ahuramazda I did; Ahuramazda bore me aid, and the other gods who are" (§62♦). It is to Ahura-Mazda that royal prayers are always raised in Darius's inscriptions. Though we fully reject the temptation to speak of evolution toward monotheism, we must recognize that in the official religion established by Darius, Ahura-Mazda had a supreme position. He is designated as the sovereign deity of the pantheon, and the other deities are invoked only nominally. This privileged alliance conferred absolute power on the king, and no one could question that power, except at the risk of divine displeasure. This is in fact the reason that the lie (*drauga*) and the truth (*arta*) represent political and religious concepts simultaneously. The king rules over the lands and peoples (*dahyāva*) thanks to the protection of Ahura-Mazda, and he must make truth reign and hunt down the lie among them in the name of the same precepts that govern relations between men and gods.

But what is most novel about this monument is quite simply the fact that the Persian language (*arya*) was being written for the first time. Despite the continuing debate over the precise meaning of §70 and the actual act of transcribing a text already inscribed in Elamite, the inclination today is to recognize that Persian writing constituted a major innovation by Darius (who did not hesitate to use it at Pasargadae in order to tap into the prestige of Cyrus to his own advantage). Until this event, the king's deeds were transmit-

ted in Persian exclusively through recitation and song and through the intermediary of masters of memory. To be sure, oral transmission remained a constant throughout the long history of the Persian people, as shown by the notable role of the *magi* in general. But this observation lends still more import to the first indubitable attestation of royal writing, inscribed in the presence of the king (and written on clay and parchment), a model that was followed by all of Darius's successors. By this very action the Great King could claim that he himself was first of all a master of truth. He intended to control the tradition he wished to be transmitted to future generations: the royal word, inscribed for all posterity on the rock, was placed under the aegis of Ahura-Mazda as protection against all those who might want to destroy it (DB §§65–67). This is how the king transmitted not only the memory of his unique exploits but also his genealogy. In this way he took appropriate measures to have his word disseminated throughout the lands of his realm (DB §70), after having it authenticated—the text had previously been read to him. At the same time, the memory of his royalty was fixed. No one, not even his successors (DB §64), would have the right to question it: on the cliff at Behistun, the history of historians is forestalled for all time.

New Campaigns, New Additions: Imperialism and Religion

The composition as a whole would soon be modified to include events that unfolded while the royal artists were still working on the sacred mountain. A new column (col. V) had to be added, in Old Persian only (for lack of room). The text begins: "Saith Darius the King: This is what I did in both the second and the third year after that I became king. A province by name Elam—this became rebellious."✧ For the third time since October 522, the Elamites rebelled, led this time by Atamaita. Gobryas, the king's faithful *bandaka*, was placed at the head of an army. He was victorious, captured Susa, and brought Atamaita before Darius, who put him to death (520). It was perhaps under these circumstances or shortly thereafter that Darius resolved to redesign Susa and erect a vast Achaemenid palace complex there.

The following year, Darius himself took command of the royal army and marched against the Central Asian Saka. The Saka king, Skunkha, was taken prisoner and replaced by another king, apparently hand-picked by Darius. It is likely that the Saka (Darius lists them among the rebellious peoples: DB §21) could not be subjugated by the satrap of Bactria, Vivāna, who had been assigned that job, a task that fell to him quite naturally. Or maybe Vivāna was killed during a battle with the Saka? We do not know. The fact is that after his victory Darius returned to Ecbatana and Behistun. Skunkha was added to the relief, behind the liar-kings. He is identifiable by his tall pointed hat, the marker of certain Saka peoples (Tigraxauda). The addition of Skunkha necessitated the destruction of the original Elamite text, which was rewritten to the left of the Persian version. This is also when the text of column V was added.

The most noteworthy novelty of this Old Persian addition is without doubt the religious justification that Darius provides for the two campaigns against Elam and the Saka. The sentence can be understood as follows: "Those Elamites (Saka) were faithless and by them Ahuramazda was not worshipped. I worshiped Ahuramazda [in their lands?]; by the favor of Ahuramazda, as was my desire, thus I did unto them."✧ Or, perhaps Darius is simply recognizing that it was because of his faith in Ahura-Mazda that he was able to conquer populations that did not worship his god. In either case, the

politico-religious implications are enormous. In contrast to the royal assertions about the rebels in columns I–IV, in column V the rebels are no longer denounced solely as bearers of the *drauga* ['liars']; they are called *arika*, usually translated 'faithless'. They are described in a clearly pejorative fashion as worshipers of non-Persian deities. This expression is also found in a Xerxes inscription, where the king condemns the cult of false gods (*daivā*) (chap. 13/6).

This statement does not in any way imply that Darius completely altered the ideological strategy of his predecessors in the conquered countries. But what is clear is that in just a few years, at the instigation of Darius, Persian royal authority was endowed with a uniformly steady and coherent politico-religious ideology. More than ever, in times of peace and times of war, the king was the earthly proxy of his god Ahura-Mazda. Furthermore, column V ends with this sentence: "Saith Darius the King: Whoso shall worship Ahuramazda, divine blessing will be upon him, both (while) living and (when) dead."♦ In view of the overall context, this statement promised heaven to whoever served the king loyally.

4. Darius and the Six

Primus inter pares?

We must now return at greater length to the relations between Darius and his companions after his accession to the throne. Reading Herodotus without perspective, one actually receives the impression that Darius was bound by the agreements that had been mutually reached by the Six when he came to power (Otanes having taken himself out of the competition), concessions that basically would have made the new king *primus inter pares*. According to Justin (who had read his Herodotus carefully), as a result of the murder of the *magus*, "the Great ones (*principes*) were equal in merit and nobility" (*virtute et nobilitate . . . pares*; I.10.1–2). This is the version also found in Plato (*Laws* 695c♦) in an otherwise very suspicious passage: "When [Darius] came and seized the empire with the aid of the other six, he split it up into seven divisions, of which some faint outlines still survive today." Are we to conclude that Darius had agreed on limitations to his royal power from the beginning and that he presented himself simply as the chief victor leading an aristocratic restoration that was originally intended to limit the absolute monarchy that had been carried to extremes by Cambyses and Bardiya?

We know that the title "the Seven" continued to be invoked as a sign of distinction among the Persian aristocracy, to the point of making them an integral part of the "pedigree" of certain aristocrats, as given by Herodotus. Thus we have references to Otanes (III.140), Gobryas (IV.132), or even Zopyrus, "son of the Megabyzus (I) who was one of the seven conspirators who killed the Magus" (III.153♦), etc. Diodorus as late as the fourth century specifies that the satrap Rhosaces "was a descendant of one of the seven Persians who deposed the Magi" (XVI.47.2♦), and Quintus Curtius introduces Orsines, chieftain of the tribe of Pasargadae, who was "a descendant of the 'seven Persians' and tracing his genealogy also to Cyrus" (IV.12.8♦). The permanence of the term thus seems assured. But does this mean that the Seven constituted an entity that had the ability to control the activities of the king?

Herodotus often calls the Seven *prōtoi* (III.68–70, 77). The small group of *prōtoi* was often convened by the king in times of peace or war. But it would be a mistake to conclude that the membership of the council was imposed on the king. What we call, purely

by convention, the "king's council" had no institutional existence of its own founded on regulations that the king could not overrule; its meetings and deliberations depended solely on the pleasure of the sovereign. Most decisions were made by the king alone, who received advice from these "confidants" who owed him everything. We cannot say that the nobles met in council simply because they were part of the *prōtoi*. It is clear that the king himself selected council members from among the aristocrats: the title "counselor" was included in the court titulature (cf. V.11–24, and especially Aelian, *VH* XII.64). This interpretation is also based on Ezra and Esther, where Ahasuerus is shown convening "the seven administrators of Persia and Media who had privileged access to the royal presence and occupied the leading positions in the kingdom" (Esther 1:13–14♦). It has often been deduced that there was a college of seven judges, a sort of sovereign tribunal, at the court. But this passage is highly suspicious, given the many other references to the number *seven* in the same work: Ahasuerus reigned over 127 provinces (1:2), and also had "seven eunuchs in attendance on his person" (1:10♦), Esther received "seven special maids" in waiting (2:9♦), etc. There is hardly any doubt that the composer was in fact aware of the existence of seven families. In itself, however, this observation constitutes a reinterpretation that the modern historian cannot use as counter-evidence.

The same remark holds true for a Xenophon passage often cited in this context (*Anab.* I.6.4♦): to judge Orontas, Cyrus the Younger convened in his tent "seven of the noblest Persians among his attendants," to whom he adds Clearchus. All we need to do is collect the evidence concerning the royal judges to see that, properly speaking, there was no college of seven royal judges who were systematically chosen from the "Seven families" and who functioned independently of the king. Herodotus defines their function as follows: "These royal judges are specially chosen men, who hold office either for life or until they are found guilty of some misconduct; their duties are to determine suits and to interpret the ancient laws of the land, and all points of dispute are referred to them" (III.31♦). It was they who condemned to death the Egyptians who had just killed a royal herald; it was they to whom Cambyses appealed to determine that he had the right to marry his sister. It was probably also the royal judges who are introduced by the composer of Esther. To judge the behavior of Queen Vashti, Ahasuerus asked his Friends to "pronounce law and judgment." They brought a report to the king proposing that an edict announcing the repudiation of the queen be proclaimed throughout the kingdom. These Friends are called "seven princes [JB: administrators] of Persia and Media" (Esther 1:10ff.).

The connection sometimes made between the royal judges and the privileged status of the seven families who aided Darius is worthless. When Artaxerxes II brought Tiribazus to judgment, "he assigned three of the most highly esteemed Persians as judges" (Diodorus XV.10.1♦). It is clear in fact that the appointment and dismissal of royal judges was solely on the authority of the king, who could reward whomever he wanted with the title of royal judge, including a man of low birth, such as the simple peasant Rhakokes (Aelian, *VH* I.34). On several occasions, judges were condemned to death for handing down iniquitous judgments, particularly for having sold out for money (Herodotus V.25; VII.194; Diodorus XV.10.1♦): "At this time other judges who were believed to have been corrupt were flayed alive and their skins stretched tight on judicial benches. The judges rendered their decisions seated on these, having before their eyes an example of the punishment meted out to corrupt decisions." Even the decision made

by the seven judges of Ahasuerus was more of an opinion: “If it is the king’s pleasure, let him issue a royal edict.” Even though the judges referred to “the law of the Persians and Medes” (Esther 1:19♦), it is clear that the decision was based solely on royal authority.

Their freedom of judgment was also limited because they were objects of surveillance by the king. Although Diodorus states that Artaxerxes II himself was not present at the trial of his son Darius, this was not the rule. Plutarch adds that the king “commanded his scribes to write down the opinion of every one of the judges, and show it to him” (Art. 29.8). Similarly, after the acquittal of Tiribazus the same Artaxerxes “summoned the judges one by one and asked each of them what principles of justice he had followed in clearing the accused” (Diodorus XV.11.1♦). The reasons that the judges gave for their decisions show very clearly that they arrived at their conclusions on the basis of the loyalty and devotion that Tiribazus had previously manifested in furthering royal interests.

Quite often, however, people were condemned by the king without previously being arraigned before a tribunal. This was certainly true for royal judges, who were condemned by the king directly. He could also grant clemency to whomever he wished. On one occasion, we even see the king pronouncing a death sentence on an accused person who had previously been acquitted by the judges (Ctesias, *Persica* §61). Good sense shines through in the reply that the royal judges gave to Cambyses when he inquired about marrying his sister: “They managed to find an answer which would neither violate the truth nor endanger their own necks: namely, that though they could discover no law which allowed brother to marry sister, there was undoubtedly a law which permitted the king of Persia to do what he pleased” (Herodotus III.31♦). Herodotus understood perfectly well that the judges did this so as not to “endanger their own necks.” In other words, the king remained the sole source of justice (Plutarch, *Art.* 23.5).

Darius’s Point of View: Nobles and King at Behistun

From Darius’s point of view, the question of an authoritative council of advisers did not even arise. In the addition in §68, he was very discreet about the role of the six aristocrats: “Saith Darius the King: These are the men who were there at the time when I slew Gaumata the Magian who called himself Bardiya; at that time these men cooperated as my followers (*anušiyā*)” (§68♦). Then, after giving the list, he adds, for the benefit of his successors: “Thou who shalt be king hereafter, protect well the lineage (*taumā*) of these men.” In the Babylonian version, the wording is: “Fully protect these men and take care of their descendants” (§54). But this royal statement loses much of its specificity when it is compared with other passages in column IV. Addressing those who behold the inscription, he proclaims: “Now let that which has been done by me convince thee; . . . tell it to the people, may Ahuramazda be a friend unto thee, and may family be unto thee in abundance” (§60♦), or indeed, “If thou . . . shalt protect [this inscription] as long as unto thee there is strength, may Ahuramazda be a friend unto thee, and may family be unto thee in abundance, and may thou live long, and what thou shalt do, that may Ahuramazda make successful for thee” (§66♦). These declarations are not unlike Cambyses’ dying words in the presence of “the leading Persians,” who had gathered to hear his last will: “If you do as I bid you [depose the *magus* and reduce the Medes to obedience], I pray that the earth may be fruitful for you, your wives bear you children, your flocks multiply and freedom be yours for ever” (Herodotus III.65♦). Indeed, the words of Darius sound like a commitment for him and his

successors to maintain the prestigious status of the families of the co-conspirators. But, in contradistinction to other promises of reward or punishment, they do not invoke Ahura-Mazda.

It is also true that Darius is not the only one shown with the liar-kings on the cliff of Behistun. Behind him are two persons (smaller than the king but bigger than the rebels): one is shown carrying a bow in his right hand and the other is holding a lance with both hands, its butt on the ground. They are obviously two Persian nobles, bearing the royal arms. Their names are not given. Could they be, as on Darius's tomb, Aspaphernes and Gobryas? All theories founder on an obvious fact: if their names have not been included, even though the liar-kings are identified by name, it is because Darius, by design, did not wish to raise these two people above anonymity. They stand metonymically for the nobles who aided him. Although we recognize that the titles "lance-bearer" and "bow-bearer" could distinguish one noble from another, nothing more can be said than that these titles were granted by the king in recognition of services rendered. We are thus closer to court nobility than to clan nobility.

The Six and Court Protocol: The Intaphernes Affair

Of course, we presume that the statements of Darius are nothing but royal propaganda. Let us return to the text of Herodotus, who details in the following terms the privileges that the six conspirators mutually agreed upon before choosing a king from among themselves:

Permission, namely, for any of the seven to enter the palace unannounced (*aneu eisaggelos*), except when the king was in bed with a woman. They further agreed that the king should not marry outside the families of the seven confederates. (III.84♦)

Even if, despite the unlikelihood of the tale, we accept the reality of the agreement, we would do well to elucidate the implications.

Let us stress first of all that, if indeed it was put into effect, the mitigation of court protocol for the benefit of the Seven did not last very long. This is what is suggested by the Intaphernes affair, which erupted some time later. There can be no doubt that Intaphernes was an important member of the conspiracy; in fact, Darius lists him first among those he calls his followers (DB §68). It was this individual who constantly showed loyalty to the new king. We know, for example, that it was he who led a victorious army against a Babylonian rebel in November 521 (DB §50).

Herodotus states, however, that Intaphernes was put to death by the king (III.118–19♦). Desiring an audience with Darius, Intaphernes "wished to enter the palace." At this point, Herodotus recalls that the Seven could "visit the king unannounced, provided that he was not, at that moment, in bed with a woman." Meanwhile, "he was, however, stopped by the king's chamberlain and the sentry on duty at the palace gate, who told him that Darius had, in fact, a woman with him at the time." In an angry fit, Intaphernes "cut off ears and noses." The outcome of the story, which Herodotus reports on the model of the intrusion of the Seven into Smerdis's royal palace, suggests that Darius was not yet totally sure of his power: "Thinking his six former confederates might all be in this business together, he sent for each of them in turn, and sounded them to see if they approved of what Intaphernes had done." Convinced that Intaphernes had acted alone, he took drastic measures: Intaphernes was put to death, along with all of the men of his House (*oikeioi*)—his sons and his relatives (*syggeneis*)—except one of his brothers-in-law, who was saved from execution by his sister.

The tale is marked by a series of repetitive motifs, and thus supports a double reading. We may recognize that Darius's authority was to a degree still tentative for some time because of the privilege granted to the other conspirators. Under the terms in force, the guardians could only refuse Intaphernes access if the king was with one of his wives. But we must also consider the possibility that Intaphernes was flaunting his insubordination by violating rules of protocol that Darius had meanwhile restored to apply even to his old companions. Even given the hypothesis that Darius's authority was still tentative, we are led to the conclusion that the initial privileges were quickly revoked. In fact, no other text suggests that certain Persian aristocrats might be exempt from the rigors of court protocol, which were probably established at the time of Cyrus and Cambyses (pp. 91ff.) and later reinforced by Darius and particularly Xerxes.

The Marriages of Darius

It is also clear that Darius paid no attention to the obligation to take a wife from among the families of the other conspirators:

The first women Darius married were Cyrus' two daughters Atossa and Artystone; the former had previously been the wife of her brother Cambyses and also of the Magus; the latter was a virgin. Subsequently he married Parmys, a daughter of Cyrus' son Smerdis [Bardiya], and, in addition to these, the daughter of Otanes [Phaidime], the man who had exposed the Magus. (III.88)

The intent and the message were clear: Darius linked himself directly to the stock of Cyrus by marrying Cyrus's two daughters (Atossa and Artystone) and granddaughter (Parmys). As for his marriage to the daughter of Otanes, it seems risky to see it as much of a concession to Otanes; this union is based on the custom whereby a new king took the wives of his predecessor(s) (Atossa, Phaidime)—just as Smerdis/Bardiya had also married Atossa, the sister-wife of Cambyses. What the matrimonial policy of Darius actually reveals is concern for dynastic continuity—however false—rather than a desire for restoration of the aristocracy. Thus, indeed, “Darius entered into family relationships with the old kings. . . . Power appeared less to pass to a stranger than to remain in the family of Cyrus” (Justin I.10.13–14).

It is clear that Darius systematically applied a policy that on the one hand allowed him to link himself fictitiously to the family line of Cyrus and on the other restricted the number of individuals who had rights as members of the Achaemenid family in the narrow sense (i.e., direct descent). Finally, he also married one of his nieces, Phratagune, daughter of one of his brothers, Artanes (VII.224). The single known exception is his marriage to a daughter of Gobryas, but this was before his accession. He had three sons by her before gaining the throne. But the discussions recorded by Herodotus about the royal succession show that there was never any real question of transmitting power to his eldest son, born of this exogamous marriage (VII.2). As we shall soon see, the policy of the Great King consisted of parceling out his daughters, a matrimonial policy that holds exactly the opposite of the meaning attributed to it by Herodotus. And the successors of Darius singlemindedly followed the same policy. It was not until the reign of Darius II that the royal family became open to exogamous marriages (see below, pp. 589–590).

The Saga of Otanes

The use of the term “the Seven” is exclusive to the Greek authors, who wanted to identify the people in their narratives and in some cases needed to distinguish among

people with the same name (cf. Diodorus XI.57.1). In some cases, they must have gotten wind of family traditions that tended to exaggerate the prestige of their ancestors. The story of Otanes and his family, revised and corrected between the fifth century and Roman times, may be an illustration of this sort of beguiling distortion.

We know, at least according to Herodotus, that Otanes had played an important role in the conspiracy of 522 and that as a result he had acquired privileges for himself and his descendants. Herodotus says, in fact, that Otanes renounced a position of power on the condition that neither he nor his descendants would be under the orders of whoever would become king, in perpetuity. Referring to this situation, Herodotus then writes:

To this day, the family of Otanes continues to be the only free (*eleutherē*) family in Persia and submits to the king only so far as the members of it may choose; they are bound, however, to observe the law (*nomos*) like anyone else. The other six then discussed the fairest way of deciding who should have the throne. They agreed that, if it fell to any of themselves, Otanes and his descendants should receive, every year, a suit of Median clothes and such other gifts as are held to be of most value by the Persians, as a mark of honour for the part he had played in the plot against the Magi, of which he was the prime mover and principal organizer. (III.83–84♦)

Later on, a legend of the Cappadocian court recounted the origins of the family and the dynasty in this way:

The kings of Cappadocia say that they trace their ancestry back to Cyrus the Persian, and also assert that they are descendants of one of the seven Persians who did away with the Magus. Now as to their connection with Cyrus, they count as follows. Cambyses the father of Cyrus had a sister of legitimate birth, Atossa. To her and Pharnaces, king of Cappadocia, was born a son, Gallus; his son was Smerdis, his Artamnes, and his Anaphas, a man of outstanding bravery and daring, who was one of the seven Persians. Such then is the pedigree they trace for their kinship with Cyrus and with Anaphas, to whom, they say, because of his valour the satrapy of Cappadocia was granted, with the understanding that no tribute would be paid to the Persians. After his death a son of the same name ruled. When he died, leaving two sons, Datames and Arimnaeus, Datames succeeded to the throne, a man who both in war and in the other spheres of royal duty won praise, and who, engaging the Persians in battle, fought brilliantly and died in battle. The kingdom passed to his son Ariamnes, whose sons were Ariarathes and Holophernes; Ariamnes ruled for fifty years and died without achieving anything worthy of note. The throne passed to Ariarathes (I), the elder of his sons, who is said to have loved his brother with a surpassing love, and promoted him to the most prominent positions: thus he was sent to aid the Persians in their war against the Egyptians, and returned home laden with honours, which Ochus, the Persian king, bestowed for bravery; he died in his native land, leaving two sons, Ariarathes and Aryses. Now his brother, the king of Cappadocia, having no legitimate offspring of his own, adopted Ariarathes, the elder son of his brother. At about this time Alexander of Macedon defeated and overthrew the Persians, and then died; Perdiccas, who at this point held the supreme command, dispatched Eumenes to be military governor of Cappadocia. Ariarathes (I) was defeated, and fell in battle, and Cappadocia itself and the neighbouring regions fell to the Macedonians. . . . (Diodorus XXXI.19.1–4♦)

Diodorus follows the history of the dynasty down to Roman times and concludes: "And that is enough on the genealogy of the kings of Cappadocia, who trace their origins back to Cyrus." We can thus see that this version was well attested at the time of Diodorus. We recognize in it several historical individuals—from Cambyses, father of Cyrus, to the

Diadochi (and after), including Datames, the criminal satrap, who is incorporated into the genealogy. This genealogy enjoyed wide success, as is evidenced by the Holofernes in the book of Judith.

Whatever the historical reality may have been, the family version has consciously manipulated it. Cyrus is named as the ancestor of the family, and Otanes (Anaphas) becomes the offspring of a Cappadocian king and the aunt of Cyrus (Atossa, who has clearly been confused, deliberately or not, with the daughter of Cyrus and the sister of Cambyses II). While a historian of family oral traditions can profit from this text, obviously someone who is interested in the origin and destiny of the Seven/Six cannot! The court legend was already known at the time of Polybius, who wrote about Mithradates of Pontus: "He boasted of descent from one of the Persian Seven who had killed the *magus*, and he maintained that his line had ever since retained the government that his ancestor had originally received from Darius in Pontus on the Euxine Sea" (V.43). Elsewhere (fragment 166), the same Polybius provides other details from the legend. In a digression devoted to Cappadocia, he records that an unnamed Persian accomplished a magnificent deed during a hunt with Artaxerxes (II). The royal mount was attacked by a lion; luckily, this Persian killed the lion with his *akinakēs* "and saved the king from a great danger." In return, the king gave him a gift (*dōrea*) of all the territory as far as he could see as he stood atop a high mountain. This tale repeats well-known motifs, particularly royal hunts for lions. It resembles the story Diodorus told about Tiribazus's deed at the court of Artaxerxes II (XV.2.3) and the unhappy outcome of the identical action Megabyzus took to save Artaxerxes I (Ctesias §40). The legendary allocation of the land is also found in various forms in Greek (e.g., Polyaeus VI.24; Plutarch, *Mor.* 820d) as well as Iranian tradition. But the tradition is even more ancient. Diodorus, doubtless relying on Hieronymus of Cardia (a contemporary of the Diadochi), states that Mithradates (who took power in Cappadocia despite the opposition of Antigonos) was "a descendant of one of the seven Persians who slew the Magian" (XIX.40.2♣). Appian heard it said that Mithradates "was linked to the Persian royal family" (*Mith.* 9).

We know that Otanes, "who had been one of the Seven," led the conquest of Samos at the beginning of the reign of Darius (III.141–147). But Herodotus says nothing about his receiving territory in Cappadocia. He merely states that the House of Otanes remained "free" and that Otanes would "receive, every year, a suit of Median clothes and such other gifts as are held to be of most value by the Persians, as a mark of honour" (III.83–84♣). The settling of the family of Otanes in Cappadocia is simply deduced from the legend recorded (in different terms) by Diodorus and Polybius. This hypothesis (it is nothing else) is also based on a comparison with other examples of territorial concessions ("without having to pay tribute"): to Bardiya from Cyrus (Ctesias §8), to Zopyrus I from Darius (Herodotus III.160), and to Belesys from Arbaces (Diodorus II.28.4). However, for various reasons, the latter two cases are historically quite doubtful. We know, finally, that around 515–514, the satrap of Cappadocia was called Ariaramnes; it is he whom Darius entrusted with leading the initial expedition against the Scythians (Ctesias §16). Should he be identified as one of the sons of Otanes, called Arimnaeus by Diodorus? But Diodorus "specifies" that upon the death of Otanes it was the other son, Datames, who succeeded him!

From all of this it appears that there is nothing to prove that Otanes received the satrapy of Cappadocia from Darius and still less to support the idea that Darius then

approved the creation of an independent kingdom! On the other hand, it is possible that he had been favored with a *dōrea*, as explained in the version known from Polybius; but the repetition of the motif of the hunt makes us suspicious. Perhaps the legend of sovereignty over Cappadocia was grafted onto this original kernel. After all, this would not be the only example of a Hellenistic genealogy that was fictitiously attached to the events of 522 (cf. Strabo XI.14.15). Whatever the case may be, it does seem that manipulation of the tradition had already begun in Herodotus's time, since he represents Otanes as the "son of Pharnaspes" (III.68♦) and father of Cassandane, the mother of Cambyses (III.2). Indeed, the Behistun inscription proves that Herodotus's information is contrived, since Otanes' patronymic is Thukra (DB §68). It is likely that this original distortion in Herodotus is responsible for Diodorus's assertion of close family ties between the families of Otanes and Cyrus.

It is true that, according to Ctesias (§20), Xerxes married Amestris, who is represented as the "daughter of Onophas." But is Onophas our Otanes? This seems totally hypothetical. In one case, Herodotus (VII.62) distinguishes the names Otanes and Onophas. Even if we agree that only one Otanes is at issue here, we must stress that this name is very common. Herodotus mentions an Otanes, father of Amestris, who in 480 led the Persian contingent (VII.61), but he lists several others as well. One is Sisamnes' son (V.25), another (or the same one) is married to one of Darius's daughters (V.116), a third is Anaphes' father (VII.62), another is Smerdomenes' father (VII.82), and last, another is Patiramphes' father (VII.40). It would be most strange if Darius had consented to a marriage between his son Xerxes and the daughter of the Otanes of 522. The only certain union between the two families is the marriage of Darius and Phaidime, the daughter of Otanes and previously the wife of Cambyses and Bardiya. This was a marriage that did not carry the political ramifications of the supposed marriage between Xerxes and Otanes' daughter. Marrying Xerxes to Otanes' daughter would have introduced rights for any grandson Otanes might have (which Darius refused to the grandson of Gobryas). Furthermore, if Amestris really was the daughter of one of the Seven, Herodotus (VII.61) would doubtless have mentioned it, because he frequently mentions such family connections (III.153; IV.132), even for Otanes (III.141).

The Family of Gobryas

Let us now turn to Gobryas. We have seen that he played a fundamental role in the conspiracy and that, according to Herodotus, he was the strongest supporter of Darius. We also know that his alliance with Darius was long-standing, since exchanges of wives took place between the two families before 522. Darius's first wife was one of Gobryas's daughters. From this union three sons were born, including Artobazanes (VII.2). For his part, Gobryas had married one of Darius's sisters. From this marriage Mardonius (VII.5) and Arabignes (VII.97) were born. Gobryas also played a role during the uprisings of subject peoples, since in 520 he was sent to put down a new Elamite revolt (DB V §71). He again appears in 513 in the immediate entourage of the king in Scythia, counseling the king to order a retreat (IV.132, 134).

He then disappears from the Classical sources. He reappears in the Persepolis documents. In February–March 498, bearing an authorization from the king, he made use of the royal road between Susa and Persepolis, and he received travel rations at two stations near Susa. His caravan joined (or crossed) another. The document mentions "the wife

of Mardonius, a daughter of the king" (PFa 5). By chance this agrees with Herodotus, who says that when Mardonius, the son of Gobryas and one of Darius's sisters, arrived in Asia Minor in 493 to take command, he had married Artozostra, one of Darius's daughters (VI.43). He was thus both the cousin and the brother-in-law of Xerxes. After his expedition in Thrace, Mardonius seems to have fallen out of royal favor. He did not participate at all in the expedition of 490. Later, however, he received an eminent position close to Xerxes. Herodotus judges him severely, and he was lost in the battle of Plataea. We know nothing of Mardonius's family after this event.

The intimacy and permanence of family ties are demonstrated by the constant favor that Gobryas retained in the eyes of Darius and that his son Mardonius subsequently received from Xerxes. The exceptional quantity of travel rations Gobryas received illustrates his eminent position in the court hierarchy, as does perhaps the elaborate nature of the seal impressed on the Persepolis tablet. But his participation in the conspiracy of the Seven does not seem to have given him any freedoms beyond those already experienced by his family, and this status was due to marital alliances made prior to 522 and especially to his unswerving loyalty to the cause of the monarchy. Darius's choice of Xerxes (his son by Atossa) at the expense of Artobarzanes (his son by Gobryas's daughter) to succeed him shows very clearly that the exchange of wives functioned in no one's favor but Darius's.

The Saga of Megabyzus

Megabyzus I is the best known of the other conspirators, because his family traditions were repeated by Herodotus and Ctesias. His son Zopyrus I, according to Herodotus, accomplished a tour de force and captured Babylon in the name of Darius (III.153–60). We might prefer Ctesias's version: he attributes the victory to his son Megabyzus II (Ctesias §22), who had married Amytis, Xerxes' daughter (§22). Three sons of Megabyzus II and Amytis are known: Zopyrus II, Artyphius, and Artoxares (§§37, 39). An analysis of the career of Megabyzus under Xerxes and Artaxerxes indicates that, despite his illustrious birth and his occasional success, he fell out of royal favor for several years. His sons fared no better: after the death of his father, the eldest son, Zopyrus II, left the king and went to Athens; Artyphius was put to death after an ill-fated revolt against Darius II (Ctesias §§50–51). The behavior of both indicates that the reconciliation of Megabyzus and Artaxerxes I depicted by Ctesias (§41) did not eliminate the mutual ill will between Megabyzus's family and the Great Kings.

Hydarnes

We have no explicit mention of Hydarnes after 520. However, some Persepolis tablets attest that he was the satrap of Media under Darius. It is possible that a Hydarnes, son of Hydarnes, who commanded the Immortals in 480 was the son of the conspirator of 522; this may also be the case for a Sisamnes, son of Hydarnes (VII.66). But the relationship between the satrap Tissaphernes and the family must remain hypothetical. A Hydarnes family reappears after the accession of Darius II, but is it the same one? This is far from certain. In any case, the story of the family also gave rise to a court legend in the Hellenistic era. In fact, Strabo records that the Armenian dynasty went back to Orontes, who was himself a descendant of Hydarnes, "one of the Seven" (XI.14.15). However, we know that the ties between Orontes and the Achaemenid royal family in reality went back only to his marriage to a daughter of Artaxerxes II, meaning that his distant descen-

dants could count Darius among their ancestors at Nemrud Daglı. This example proves once again that the traditions of the families of the Seven were systematically used later on for dynastic legitimation.

A Summary of the Discussion

It thus does not appear that the families of the Seven were granted exceptional status in perpetuity by the Great Kings. Even if we accept the hypothesis that Bardiya/Gaumata sought to weaken some of the noble families, we still must avoid concluding that the aristocracy was restored when he fell from power. That some clan chieftains cherished the hope, for a moment, of counterbalancing the powers of the king is a hypothesis that, while insufficiently supported, lies within the realm of possibility. We would still need to explain how Otanes could withdraw with such apparent good will. Only one of the Seven, Intaphernes, tried to free himself from the king's power. But his attempt was doomed to failure because Darius had meanwhile won prodigious victories and was able to attract the loyalty of the Persian aristocracy. Darius exhibited exceptional capacities for authority and command, which his companions do not seem to have seriously contested.

While some descendants of the Seven received honors and special privileges, they were not fundamentally different from the honors that were granted to the other great noble families. This is probably the underlying reality expressed by Plutarch: "To the seven Persians who killed the *magi* the privilege was granted that they and their descendants should wear their headdress tilted forward over the forehead; for this, so it appears, was their secret sign when they undertook their act" (*Mor.* 820d \diamond ; cf. also Polyaeus VII.11.2). This distinction, which Plutarch found a hint of in his evidence, was simply a royal gift that, far from obligating the king, increased the dependence of the nobles on him. This is probably why Gobryas and Aspathines appear bearing the royal weapons on the king's tomb at Naqš-e Rostam: they had been integrated into the court hierarchy (DNC-d).

Finally, the phrase *seven families* after 520 is in large part illusory (we should speak of six families after the elimination of Intaphernes and his circle!). The label relates more to family traditions than to dynastic traditions, which, quite to the contrary, tended to push those who participated in the conspiracy that brought Darius to power into the shadows. But even if the Achaemenids (in the clan sense used by Herodotus I.125) were part of the conspiracy, the family of Darius itself (the Achaemenids in the restricted sense imposed by the new king) was still placed above and beyond this small aristocratic circle — which was another way of excluding the aristocrats who had lent their aid to Darius from dynastic competition.

5. Summary and Perspectives

A New Foundation for the Empire

The ways and means of Darius's accession to power — to the extent that we can reconstruct them — are a testimony to the new king's energy and decisiveness. Darius was undeniably an exceptional personality, but he also proved to have organizational ability. During the same time that he was reorganizing the entire tribute system, other projects were carried out in various regions: construction of new capitals, the conquest of Samos, expeditions from the Indus to the Nile; in 518 he also commissioned the satrap Aryandes

to gather Egyptian sages to collect the “Egyptian laws”; other measures affecting Jerusalem were effected at the same time.

What is striking is the care with which the king planned for the long term. Darius wanted above all to create a new lineage. To this end, he manipulated dynastic circumstances with a great deal of skill. The redefinition he imposed on the word *Achaemenid* allowed him to exclude those who belonged to the clan of the same name from the line of succession. Henceforth, power could only be transmitted from father to son in one restricted family, which was placed under the blessing and protection of a founder-hero, Achaemenes, invented out of whole cloth. Darius and his counselors were able to carry out political and ideological rethinking that was no less remarkable. From early on, the king was preoccupied with providing an ideological base for his authority and his lineage. Beginning in the late 520s, Achaemenid monarchic ideology was articulated around rules and justifications where politics and religion were fused into a whole of rare consistency. The authority of the king and the rights of his family were henceforth under the protection of Ahura-Mazda, who was invoked as the great god of the king and the Empire. The concept of *arta* (‘truth’)—in relation to its antithetical corollary, *drauga* (‘the Lie’)—was the true linchpin of this ideological structure. This is the program we see at work in the new residences in Susa and Persepolis as well as on the royal tomb at Naqš-e Rostam.

Without in the least deprecating the work accomplished by his predecessors (chap. 2), we may thus assert that the advent of Darius marks the foundation of a new dynastic and imperial order. In this regard, the first years of his reign definitely represent a decisive period in Achaemenid history. But at the same time, Darius took care to entrench his reign in the *longue durée*. The projects he undertook at Pasargadae are another testimony to his ambition to place the upheaval he created within the continuity of Persian history. Contrary to what has long been thought, Darius actually never sought to inflict a *damnatio memoriae* on the founder of the Empire. On the contrary, he intended to promote skillful propaganda at Pasargadae that would allow him to establish a fictitious link with Cyrus, just as he did with his matrimonial policy.

Diachrony and Synchrony

I should mention in passing that Darius’s activity is attested in numerous domains and in numerous regions of the Empire. But it is impossible to offer an absolutely continuous story from the 520s until 486. I am thus led first to analyze each successive conquest by the new king individually, because it was these that permitted the Achaemenid Empire to achieve its greatest extent (chap. 4). The other aspects of his immense accomplishment will be treated in the course of thematic and regional chapters (chaps. 5–12); these studies will help us better to appreciate as a whole what the Empire was at the death of the Great King and will also lead us to understand better the particular accomplishment of Xerxes (chap. 13).

Chapter 4

Darius the Conqueror (520–486)

1. The Pursuit of Territorial Expansion (520–513)

Darius, Democedes, and the West

Darius did not relax his efforts at extending the imperial realm. There is no question that, after the conquest of Cyrus and even more after the taking of Egypt, the Persians wanted to extend their dominion from the continent to the Aegean Islands. In this sense, Oroetes' attack on Polycrates on the island of Samos, for example, did not conflict with the objectives, overt or covert, of the central government. We have little enough information about the countries of Asia Minor between the execution of Oroetes of Sardis ca. 522–520 and Darius's first direct offensive in Europe in 513. We are indebted to Herodotus for several clarifications of Darius's Aegean policy at the very beginning of his reign. Unfortunately, Herodotus's notes are no more than a subplot, so to speak, in a fairly long but not very scientific digression about the adventures of Democedes, a physician from Crotona in Italy, who had been taken prisoner by the Persians when Oroetes put Polycrates, tyrant of Samos, to death. Brought to the royal court after the execution of the miscreant satrap, Democedes became one of Darius's favorites: "He lived in a large house in Susa, took his meals at the king's table" (III.132♦). He was also friendly with one of the king's wives, Atossa, daughter of Cyrus, on whom Herodotus tries to confer an unusual political position. At Atossa's urging, Darius let his desire to conquer Greece become known. But, before launching an expedition, he decided to send out a reconnaissance mission guided by Democedes: Darius "begged him to give the reconnoitering party such guidance and information as they needed, and afterwards to return to Persia" (III.135♦). The Persians left from Sidon and "made a written report of the results of a careful survey of most of the notable features of the coast [of Greece], and finally arrived at Tarentum" (III.137♦). Then Herodotus tells how the Persians, deprived of their guide Democedes, were reduced to slavery in Iapygia (in Italy, then controlled by Greece) before being returned to Darius by Gillus, a Tarentine outlaw, and concludes "These Persians . . . were the first who ever came from Asia to Greece" (III.138♦).

It is hard to separate history from fairy tale in Herodotus's story. In the rationale of his approach, the Democedes affair takes on a particular purpose: to show that the Persian Empire and the Greek world were becoming acquainted well before the onset of the Persian Wars and that, quite early on, Darius cherished notions of conquest in the west.

Darius, Syloson, and Samos

After narrating the adventures of Democedes, Herodotus begins a new digression with these words: "These events were followed by the capture of Samos" (III.139♦). The probable chronological context makes one think that Darius's decision was made shortly after his accession (520–519?). As is often the case with Herodotus, however, what we consider the important causes of a historical event are presented in a personal, anecdotal form.

One of Polycrates' brothers, Syloson, took part in the conquest of Egypt. During this expedition, Darius came to owe Syloson a favor because he had presented a garment to Darius as a gift. After the accession of Darius, Syloson presented himself at the gates of the royal palace, asserting his status as "benefactor" of the king—a term that included all who for any officially recognized reason had the right to request a favor (cf. chap. 8/1). He asked permission to recover Samos, which since the death of Polycrates had been in the hands of Maeandrius, son of Maeandrius, "the man whom Polycrates on leaving the island had appointed to tend to his affairs" (III. 139–42♦). "Darius consented to Syloson's request, and dispatched a force under the command of Otanes, one of the seven, with orders to do everything that Syloson had asked; and Otanes, accordingly, went down to the coast to make his preparations" (III. 141♦). Otanes reappears here for the first time since his forfeiture of the "royal competition." It is hard to know why he was chosen over the satrap of Sardis (about whom, actually, we know nothing after the execution of Oroetes). As always, the leader of the expedition had received very strict and precise instructions from Darius: "Not to kill or capture any Samian, but to hand the island over to Syloson intact" (III. 147♦), instructions that Otanes violated (according to Herodotus) because of a provocation instigated by Maeandrius. The upshot was that Syloson was installed as tyrant of Samos.

The affair was important. Indeed, in theory the conquest was carried out for the benefit of Syloson. But Syloson was in fact an Achaemenid client; he had been installed by a Persian army by order of the Great King. The royal bequest made him obligated to Darius ever after. We can thus consider Samos the first Persian conquest in the Aegean islands. Indeed, it held a very important position both strategically and commercially because of the changes brought about by Polycrates. Behind the anecdotal character of Herodotus's tale we can see the working out of a strategy long entertained by Darius. There is no doubt that Herodotus was anachronistic in attributing to Darius a plan to lead an expedition against the Scythians at that early date. There is also no doubt that Darius, in the footsteps of his predecessors, had early on understood the importance of an Aegean policy, if only because of the proximity of the islands and the close relations they maintained with the mainland towns that were subject to Achaemenid authority at that time.

Darius, the Indus, and the Nile

Herodotus also mentions that Darius launched an expedition that started at the Indus (IV.44) and thirty months later reached Egypt. Though Herodotus's text is clearly based on information received from his compatriot Skylax, it is not entirely clear. According to Herodotus, Darius apparently had two objectives: on the one hand, he wanted to determine whether the extremities of his Empire could be linked to each other and to the center (Elam); on the other, he wanted to organize a reconnaissance mission that would open the way for the projected conquest of the Indus Valley, the *Hindus* of the royal inscriptions. Herodotus's text certifies that this conquest was led by Darius himself or by one of his armies—we cannot say with certainty which. The date of the conquest is itself uncertain, perhaps just after the campaign against the Sacians of Skunkha, that is, around 518? At any rate, the most recent investigations have shown that no logical, chronological link exists between this expedition and the order to dig a canal between the Nile and the Red Sea.

Aryandes and Barca

Herodotus's long account of the history and peoples of Cyrenaica and Libya (IV, 145–205) includes some information on relations between Aryandes and the Greek leaders of Cyrene and Cyrenaica. One of the town's rulers, Arcesilaus (successor to Battus), was killed in a civil war. His mother, Pheretima, sought refuge in Egypt—which was at that time governed by the Persian satrap Aryandes—taking advantage of the fact that her son had “put Cyrene under Cambyses' control and fixed a rate of tribute” in 525, thus displaying his “friendship with Persia,” according to Herodotus (IV.165♦). After obtaining Darius's permission, Aryandes sent a strong army and naval force against Cyrene, led by two Persian nobles named Amasis (a Maraphi) and Badres (a Pasargade). After a long resistance, the Barcaeans agreed to sign a treaty with Amasis. Amasis did not keep his word: the captured Barcaeans “were sent from Egypt to the Persian King Darius, who gave them a village in Bactria to live in. They named the village Barca, and it was still inhabited within my own memory” (IV.204♦). The motivations for the Persian expedition against Cyrene and Libya are not very clearly set out by Herodotus. He records what some of his informants told him: the refuge granted to Pheretima was just a pretext. “Its real object, I fancy, was the subjugation of Libya. The races of men in Libya are many and various, and only a few of them were subject to the Persian king; the greater number never gave Darius a moment's thought” (IV.167♦). However, the Persians never got farther than Euesperides, near Barca.

The text of the agreement between the Barcaeans and Amasis provides a partial reason. “They promised to pay the Great King a suitable tribute” in return for a commitment (not observed by Amasis, however) to leave the city alone. This commitment indicates that they had ceased to pay the tribute Herodotus attributes to them in his report on tributes paid to Darius: “Egypt, together with the Libyans on the border and the towns of Cyrene, and Barca (both included in the province of Egypt) paid 700 talents” (III.91♦). In other words, Aryandes profited from Pheretima's solicitation by trying to increase his dominion over Cyrenaica, which at that time was still only partial. Because Amasis reminded Badres that “the objective of the expedition had been the single Greek city of Barca” (IV.203♦), we may conclude that this town was picked out for a reason. The leaders of Cyrene from the time of Arcesilaus had also regularly delivered their fixed share of the total amount of the tribute from the Egyptian nome to Aryandes. Moreover, at this point the commanders of the army received Aryandes' order to return. The intervention on behalf of Pheretima was thus aimed at reinstating the subject status of Cyrene. It seems, however, that the Persians did not succeed in getting the Libyans all back in line, since Herodotus writes: “Most of them . . . cared nothing for the king of Persia, any more than they do to-day” (IV.197♦).

2. The Persians in Europe

Darius's Scythian Expedition (513)

In dealing with the evidence for the years 518–517, historians find themselves in a difficult situation. It is virtually impossible to compose a continuous narrative. In fact, Herodotus's tale in book III, after the excursus on Democedes and Syloson, closes with a story bearing on a revolt of Babylonia (III.150–59). This story is repeated by Justin (I.10.15–22) and is difficult to interpret historically and chronologically. Herodotus, Justin, and Ctesias do not return to the course of events until the eve of Darius's expedition

against the Scythians. Herodotus opens book IV this way: “After the capture of Babylon Darius invaded Scythia” (IV.1♦; cf. Justin I.10.23). These gaps explain why the chronology after the last events mentioned by Darius at Behistun have always been the subject of much discussion (e.g., the date of Darius’s expedition to Egypt). The same situation exists, on the whole, for Darius’s expedition against the Scythians. The gaps in evidence make it difficult to date, but there is now good reason to date it ca. 513, a date approximately contemporary with the Persian expedition in Libya. Although the chronology does not pose insurmountable problems, the reasons, objectives, and results of the expedition continue to divide historians.

According to Herodotus, Darius made immense preparations, “sending messengers to every part of his dominions with orders to raise troops here, ships there, and labourers somewhere else to work on the bridge over the Bosphorus” IV.83♦. The number of boats gathered was around 600, according to Herodotus (IV.87), but there as elsewhere the figures must be taken for what they are, because Herodotus was always interested in stressing the immensity of the royal forces (IV.87: 700,000 men, not including the naval forces!). Among the Greek cities, Herodotus enumerates in particular the cities of the Hellespont and the Propontis (Sea of Marmara): Abydos, Lampsacus, Parion, Proconessus, Cyzicus, Byzantium, and also some of Ionia (Chios, Samos, Phocaea, Miletus) and of Aeolis (Cyme). Herodotus also mentions an Athenian named Miltiades, “who was master of the Chersonese on the Hellespont and in command” (IV.137♦). Leaving Susa, the king arrived with his army in the neighborhood of Chalcedon, then crossed into Europe, after enjoining the Ionians “—who, with other Greeks from Aeolis and the Hellespont, were in charge of the fleet—to sail into the Black Sea as far as the Danube, where they were to bridge the river and await his arrival” (IV.89). Darius marched across Thrace, where some peoples surrendered without a fight and others (the Getae) after fierce resistance (IV.93). Leaving the Ionian tyrants to guard the Danube crossing, the king penetrated Scythian territory. There he encountered a true coalition of peoples who refused to engage in pitched battle. Darius found himself in desperate straits and, with the advice of Gobryas, decided to retreat. Pursued by the Scythians, he nonetheless managed to reach the Danube and cross the river. The Ionian tyrants, despite the cogent arguments of the Scythians, had refused to leave the Persian camp (IV.136–39). The end of the story is quite abrupt: “Darius marched through Thrace to Sestos in the Chersonese, where he took ship for Asia, leaving a distinguished Persian named Megabazus to command in Europe” (IV.143♦).

Darius’s expedition poses many questions and has given rise to many divergent interpretations, primarily because our basic source, Herodotus, treats it only very superficially. His main interest is in fact describing the different Scythian peoples. After briefly introducing the Persian expedition, Herodotus launches into one of those digressions so dear to him (IV.1–40). One digression leads to another; he then dedicates several chapters to Libya, the guiding thread of the progression being an inquiry into the limits and configuration of the known world (Asia, Libya, Europe; IV.36–47). It is only in §83 that he returns to Darius, after giving a mass of information on Scythian customs. In the story as a whole, the parts dealing with Darius’s expedition appear more as a pretext than as the true subject of the general account.

Despite these conditions, we continue to inquire into the purposes and objectives of Darius, as well as the magnitude of the Persian defeat. Was the Great King preparing to

subject the Scythians of southern Russia and integrate them into his Empire, perhaps to return via the Caucasus? or was the march beyond the Danube considered a mere corollary to an objective centered on the conquest of Thrace? Herodotus would give us to understand that Darius had dreamed very early on of conquering Scythia and that Atossa, egged on by Democedes, urged him to turn his attention instead toward Greece (III.134; cf. p. 139 above). But the entire Democedes story is highly suspect. Even if the conquest of Samos around 519 effectively shows that Darius had an Aegean plan, it does not prove that at that date he thought of launching an expedition to Scythia or of preparing a vast offensive against European Greece. Herodotus's other explanation, that Darius's purpose was to avenge the Scythian invasion of Asia (IV.1 and VII.20), hardly deserves the attention of historians. I also have major reservations about Justin's account, that Darius opened hostilities to punish the Scythian king, Ianthyrus, for refusing him the hand of his daughter (II, II.5.9). This is in fact a literary motif, found for example in one of the versions of Cambyses' expedition against Egypt. Ctesias adds information not found in Herodotus: he records that

Darius enjoined Ariaramnes, satrap of Cappadocia, to penetrate the country of the Scythians and to take men and women captive there. The satrap crossed with 30 fifty-oared galleys (quinqueremes) and took prisoners. He even captured the brother of the king of the Scythians, Marsagetes, whom he had found imprisoned on the order of his own brother for some misdeed. Irritated, Scytharbes, the king of the Scythians, sent a letter of grievances to Darius, who responded to him in the same style. (§§16-17)

It thus seems that the offensive was preceded by a period of tension and a limited expedition led by the satrap of Cappadocia, perhaps for the purpose of gathering information on the country. But in all this foofaraw we do not find any really satisfactory explanation. It is for this reason very tricky to estimate the magnitude of the defeat suffered by Darius. We can hardly trust Herodotus, who received his information from Scythians and Greeks. The difficulties of analysis are further increased by the uncertainties that continue to weigh on the identification of the Scythian peoples introduced by Herodotus.

What seems surprising is that Darius left the Greek fleet at the mouth of the Danube. This strategy implies that his territorial objectives could not have been far away. If they had been, he would have adopted the traditional tactic of having the army and navy proceed together, so that the navy was able to provision the army. But did the fleet left on the Danube represent all of the ships pressed into service by the Great King? Herodotus's narrowly Hellenocentric orientation prevents us from being certain about the matter. Whatever the case may be, the retreat of the Persian armies from Scythia certainly damaged the prestige of the Great King, at least in the short term, as seen in the revolts that then broke out among the Greek cities, in particular the cities on the Hellespont (IV.144; V.1). Among the cities that seceded from the Persians at this point were some that had sent a naval contingent to Darius (IV.138). It is likely that they then returned home, paving the way for an insurrection (cf. V.27). The revolt of these cities could also be explained as a deception, particularly if we agree that at the start the interests of certain tyrants and of the king converged: the tyrants joined Darius's force in the hope that the expedition to the Black Sea would allow them to reenter a region where they had founded colonies but where the Athenian commercial offensive had diminished their influence.

The Persians in Thrace

Whether or not this is a legitimate speculation, it is clear that the bottom line of the Persian expedition was far from negative. In fact, whether Thrace was Darius's primary objective or not (it is impossible to determine), it was conquered by the Achaemenid armies. Darius had already subjugated several Thracian peoples on his path to the Danube. And before reembarcating for Asia Minor, he left Megabazus in Europe "with this mission: "to conquer Thrace" (V.2♦). He first "began the reduction of such communities in the [Hellespont] neighbourhood as opposed the Persian power" (IV.144♦), and he seized Perinthus (V.1): "Then Megabazus marched through Thrace, bringing every city and every people in that part of the country under the control of the Persian king" (V.2♦). The Paconians were the most severely affected by Megabazus's offensive: he seized their principal inland settlements, and he deported some of them to Asia Minor (V.15–16). The task was completed by Otanes, to whom Darius gave "the command of the troops of the coast," just before leaving Sardis (around 510? V.25♦). Otanes seized Byzantium and Chalcedon (the keys to the Bosphorus), then Antandrus in Troas, and last, the islands of Lemnos and Imbros (V.27). In contrast, the Ionian towns did not join in the revolt. The reason was doubtless that Darius's expedition marked the end of a degree of autonomy for the cities of Propontis, autonomy that had already been lost by the Ionian cities at the time of the conquest of Samos around 519. Obviously, most of the tyrants shared the opinion of Histiaeus of Miletus, who, when the Scythians asked them to dissociate themselves from Darius, "pointed out that each one of them owed his position as head of a state to Darius, and, in the event of Darius' fall, he himself would be unable to maintain his power at Miletus, and all the rest of them would find themselves in a similar difficulty" (IV.137♦).

A Summary

While we are unable to evaluate the objectives of Darius's expedition, we can evaluate the results achieved. On the northern front, no Achaemenid army would ever again be risked beyond the Danube. Perhaps Darius's objective was simply to safeguard the borders of the empire and to prevent Scythian raids in the regions between the Danube and the Aegean (cf. VI, VI.40). In any case, according to Dino, the Great Kings took the Danube to be the frontier of their dominion (Plutarch, *Alex.* 36.4), which means that, at least in the imperial imagination (cf. chap. 5), all of the Thracian regions south of the river were considered to answer to the authority of the Great King, while at the same time the lands beyond the Danube were banished from the *oikoumenē* and from history.

The seizing of Thrace was an event of major importance for Persian power. The region is rich in strategic materials. Darius had granted Histiaeus a region in Thrace, near Myrcinus, in the canton of the Edonians in repayment for his loyalty. Histiaeus intended to found a town there (V.11). Shortly afterward, Megabazus communicated to Darius his fears regarding the increasing power of Histiaeus. "The site, with its silver mines, and abundance of timber for building ships, and making oars, is a very valuable one. The neighbourhood is thickly populated both with Greeks and other people." Darius was convinced and recalled Histiaeus to Sardis, bringing him back to Susa with him and awarding him the titles "counselor" and "table-companion" (V.23–24♦). The mines of Mt. Pangaeum in Thrace were in fact well known (cf. VII.112), even as well known as the mine at Scapte Hyle worked by Thasos (VI.46). The coinage struck by various Thra-

cian and Paeonian peoples attests to the abundance of precious metals. In brief, these cities and peoples were well able to pay tribute in silver to the Persian administration.

To the west, Persian dominion thenceforth affected Macedonia (cf. VI.44). In fact, Megabazus had sent an embassy to the Macedonian king, Amyntas I, with "a demand for earth and water." Despite favorable legends about the Macedonian royal house collected later by Herodotus (V.17–21), this fact remains: the Macedonian kings had to recognize the sovereignty of the Great King. It was inevitable, given the all-too-close Persian garrisons, the most important and strongest of which were at Eion (at the mouth of the valley of the Strymon) and Doriscus on the Hebrus (VII.59: *basileion*/garrison), where Darius had appointed commanders (VII.105). Thereafter, all of the countries paid tribute to the Great King (VII.108).

Meanwhile, it must be recognized that evidence concerning Persian settlement at this time is highly inadequate. It is commonly thought that the new countries were integrated into a new satrapal district. But was this really the case? Speaking of the march of Xerxes from Doriscus to central Greece in 480, Herodotus states that "the whole country as far as Thessaly had been forced into subjection and made tributary to Persia by the conquests, first, of Megabazus and, later, of Mardonius" (VII.108♦). It is not impossible that this district was not set up until *after* the expedition led by Mardonius, for it seems clear that his enterprises were aimed at stricter oversight by Achaemenid authority in the region. Furthermore, after Megabazus's campaign, Thasos continued to work the mines of his dominion (VI.46), whereas Herodotus notes that in 480 the mines of Mt. Pangaeum were always worked by the Pierians, the Odomanti, and the Satrae (VII.112). In fact, Herodotus himself specifies that a number of Paeonian peoples (from Mt. Pangaeum), Doberi, Agriani, and Odomanti (from Lake Prasias) "were not subjugated by Megabazus" (V.16♦).

Nor is there any sure proof that Macedonia was incorporated into a Persian district. Amyntas I enjoyed a normal reign until 498, when Alexander I succeeded him. According to Herodotus (V.21), Alexander I gave his sister Gygaea in marriage to a Persian named Bubares, who had come to look into a massacre of Persians who had been sent to Amyntas I's court by Megabazus (V.18–20). Bubares was doubtless Megabazus's own son (VII.22), and he apparently stayed in Macedonia for several years (Justin VII.4.1). Amyntas II was born out of his marriage to Gygaea (Herodotus VIII.136). According to Justin, this marriage allowed Amyntas I and Alexander I to maintain good relations with Darius and, later, Xerxes (VII.3.9; 4.1). It seems risky, given the state of the evidence, to conclude that Bubares played the role of a sort of Persian high commissioner in a Macedonian kingdom, which was itself part of a Thracian-Macedonian satrapy.

To sum up, Darius's undertaking in Thrace was obviously neither a secondary nor a temporary objective: the establishment of garrisons, the imposition of tribute (in silver and men), the protectorate imposed on the Macedonian kingdom, as well as the retaking of the region briefly conceded to Histiaeus indicate unambiguously that, in the king's mind, it was an essential phase of his new conquests, just as were the expeditions to the Indus or to Cyrenaica. We do well to stress an important aspect of the strategy followed first by Megabazus and then by Otanes: to strictly control the route joining Asia Minor to their new European conquests. In fact, the Persians took control of the straits, both the Bosphorus (Byzantium and Chalcedon) and the Hellespont and the islands that command its entry (Imbros and Lemnos). The city of Lampsacus (on the Hellespont) was

held by a tyrant, Hippocles, “all-powerful before Darius” (Thucydides VI.59.3). At the entry to the Hellespont, Sigeion had long been a dynastic possession of the Athenian tyrants. In 513, Miltiades the Younger, the representative of this Athenian family, had had no option but to take part in Darius’s Scythian campaign. A few years later, after Cleomenes I of Sparta drove Hippias out of Athens, Hippias sought refuge with Artaphernes: He “moved heaven and earth . . . to procure the subjection of Athens to himself and Darius” (Herodotus V.96♦).

Before leaving Sardis, Darius had named Artaphernes satrap there, “his brother by the same father” (V.25♦). He received extended powers, to go by what Aristagoras says, as transcribed by Herodotus: “in command of the whole coastal district of Asia” (*pantoi hoi epithalassioi*; V.30♦). Otanes was placed in “command of the coast” (*hoi parathalassioi andres*; V.25♦) and obviously took on some of the authority of Artaphernes, who co-ordinated all of the Persian forces up to the Halys River (V.102). It is difficult to be certain that Artaphernes supervised the control of the European conquests. In the context of the Ionian revolt, Herodotus (VI.33) refers to the governor of Dascylium, Oebares, son of Megabazus (VI.33). Whatever the uncertainty of the (variable) administrative content of the word *hyparkhos*, there is every reason to think that this Oebares was satrap of Dascylium. Without any doubt, he also had responsibilities in this area, if only by reason of the strategic position of his satrapy, magnificently situated to serve as a bridge between Asia and Europe. Finally, Sestos in the Chersonese of Thrace was a fortified city of decisive importance. The bridge built before 513 by Mandrocles of Samos (IV.87–90) led to a terminus near Sestos, and it was by this bridge that Darius embarked on his return from Thrace some time later. In 480, Sestos and the region were held by Artayctes, who took his orders either from Dascylium or Sardis, or else directly from the king.

3. The Ionian Revolt (500–493)

The Thread of Events and the Problems Posed

“Then trouble ceased for a while, until it broke out again in Ionia. This time it came from Naxos and Miletus” (V.28♦). This is how Herodotus begins a long passage on the revolt of Ionia, with nothing more to say about the period between the conquests of Otanes (V.27: around 510) and the prelude to the revolt (499). Here is Herodotus’s version of the chronological sequence of events.

Around 500–499, the tyrant of Miletus, Aristagoras, nephew of Histiaeus (who since 511–510 had remained at the court of Darius; V.24), came to Artaphernes with a proposition that would be to their mutual advantage. Certain Naxian aristocrats, driven from their island by the people, had come to seek aid from Aristagoras on the basis of their friendly relations with Histiaeus. Since he did not have the forces necessary for this undertaking, Aristagoras turned to Artaphernes, showing him the advantages of such an expedition: “You will add to the King’s dominions not only Naxos itself but the other islands of the Cyclades, such as Paros and Andros, which are dependent on it. Then with the Cyclades as your base you will have no difficulty in attacking Euboea” (V.31♦). With Darius’s consent, Artaphernes gathered a major force whose command he entrusted to Megabates, “a cousin both of Darius and himself.”♦ Dissension arose very quickly between Megabates and Aristagoras: the best they could do was leave the exiled Naxians in a fort and return “to the mainland. The expedition had been a failure” (V.30–35♦).

Map 1. The Ionian Revolt.

Motivated by the fear of dismissal and by a message from Histiaeus, Aristagoras decided on open revolt against Darius, despite opposition expressed by the historian Hecataeus of Miletus. After winning over the tyrants who had participated in the expedition to Naxos, "Aristagoras, in open rebellion, set himself to damage Darius in every way he could think of" (V.37♦). One of his first acts was "pretending to abdicate his own position in favour of a democratic government [isonomy], and then went on to do the same thing in the other Ionian cities" (V.38♦). Conscious of his military inferiority, he left for Greece. At Sparta, he was politely turned away by King Cleomenes I, despite tempting promises of booty from barbarians "who have little taste for war" (V.49♦). "From Sparta, Aristagoras went on to Athens" (V.55♦). "Persuaded to accede to Aristagoras' appeal, the Athenians passed a decree for the dispatch of twenty warships to Ionia" (V.97♦), which were soon followed by five from Eretria (V.98).

Hostilities began with a raid launched by the Ionians against Sardis itself (499?). Unable to capture the acropolis, which was defended by Artaphernes in person, the Ionians burned the city below it, then retreated. Pursued by Persian forces, they suffered a major defeat near Ephesus. At that point the Athenians recalled their ships (V.99–103). Soon, however, the revolt spread from Byzantium in the north to Caria in the south (498–497), then to the Cypriot city-states except for Amathus. Persian forces disembarked on the island: the Ionians won a sea battle, but the Persians won on land and after some months took the last resistant cities (V.104–16). On the continent, the Persian generals pursued the land offensive until the Carian declaration of war forced them to send men there. After an initial victory, the Persian army fell into an ambush where its leaders perished (V.116–22). Nonetheless, the remaining Persian generals pursued a systematic reconquest of the Hellespontine and Ionian towns (497). Aware of the impossibility of defeating the Persian forces, Aristagoras relinquished power to Pythagoras, then set sail for Myrcinus, a prior gift from Darius to Histiaeus. He was then lost in a little-known battle against Thrace (V.122–26). These were the conditions, Herodotus says, upon Histiaeus's return to Sardis (496?). He was soon to die by order of Artaphernes. The Ionian fleet was concentrated at Lade but was weakened by overt or covert defections to the Persians. The Persians won a victory at Lade, whereupon Miletus, besieged by land and sea, had to surrender (VI.1–22; 494). The victory was followed by merciless vengeance (VI.22–41; 493). Herodotus ends his tale with a description of the measures taken by Artaphernes to restore law and order (VI.42–43).

This is the bare-bones outline of what Herodotus relates. It is obvious that the importance Herodotus places on these events is out of proportion to Darius's greater concerns in an Empire that thereafter extended from Macedonia to the Indus. Furthermore, between 500 and 493, the Great King was engaged in a number of other enterprises on which the Ionian situation had not the slightest effect. This observation doubtless captures some aspect of historical reality. But it also rouses certain methodological reservations, since it is based implicitly on the silence of both the Greek and Persian sources. Of course this silence means nothing, since royal inscriptions are not narrative texts. By way of comparison, we would have no idea of the extent of the policy carried out by Darius in the Nile Valley if we did not have Egyptian documents. There is one hint of the Ionian revolt found in a Persepolis tablet (Q 1809): a travel voucher indicates in fact that Datis (see p. 158) returned from Sardis in February–March 494, bearing a royal authorization. It is tempting to suppose that he came on Darius's order to make a tour of inspec-

tion of Asia Minor on the eve of the final offensive (which was quite certainly ordered by the king himself and his advisers). There can be no further doubt that the Persian forces based in Cilicia were under direct orders from the central administration to launch a vast offensive against Cyprus in 497 (V.108). Herodotus's tale of the final moments of Histiaeus also shows that Darius intended Artaphernes to operate on royal instructions (VI.30), in the same way that he had obtained the king's permission before launching the expedition against Naxos (V.31–32). While it is possible that Darius in the beginning (as Herodotus records in a suspicious passage; V.105) did not harbor great fears, confident as he was of the military superiority of his troops, it is more certain that the operations could not fail to stimulate his irritation and his desire to be done with them. It is in this context that Herodotus reports that Histiaeus persuaded the Great King to allow him to return to Miletus to convince his compatriots to abandon the fight. In fact, Darius's western strategy required him to mount a vigorous effort to retake the coast of Asia Minor. To lose it at this date would have amounted to an infinitely more serious failure than what he had experienced on the Ukrainian steppes. Furthermore, the Ionian revolt poses a series of historical problems whose importance exceeds the limited geographical context of the Asia Minor coast. An analysis of these events can in fact enlighten the political and military situation of the whole Empire at the beginning of the fifth century, as well as the nature of the bonds that united the central, satrapal, and local powers.

To answer all these questions, historians ceaselessly analyze Herodotus, because, except for a few brief allusions elsewhere (e.g., Diodorus IX.25), and despite Plutarch's attacks on him (*Mal. Her.* 24 [*Mor.* 861]), he represents our only source of information. For Herodotus, the description of the revolt is intimately linked to a wider historiographic objective: to explain the origins of the wars between the Persians and the Greeks. And in his mind it is clear that the Ionians, for whom he did not harbor the least sympathy, played a despicable role: their revolt brought on devastation (V.28). The burning of Sardis offered the Persians a pretext for launching a war of reprisals against Eretria and Athens (V.102), and the sending of Athenian and Eretrian reinforcements "was the beginning of trouble not only for Greece, but for the rest of the world as well" (V.97♦). Aristagoras is presented as a crazy man, guided at first by the fear of losing power at Miletus and ready to involve the Greeks in a hopeless revolt (V.35): when he urged the exiled Paeonians in Asia to recapture their countries, it was not to achieve any advantage for the Ionians, it was simply "to annoy Darius" (V.98♦). Herodotus also states (not unmaliciously) that Aristagoras himself did not take part in the raid on Sardis (V.99). And finally, unable to follow through to the end of the operations he had initiated, this "poor-spirited creature" left Asia Minor for Thrace (V.124–26♦).

An Economic Crisis?

The problem, obviously, is that Herodotus clearly does not ask the questions to which historians seek answers. Many uncertainties remain, including those of a chronological nature. This is most vexing for those attempting to reconstruct a chain of cause and effect. But the origins and development of a revolt over such a long time are particularly problematic. Many have wondered whether the Persian conquest set in motion an economic crisis in the cities of Asia Minor. Completely opposite responses continue to be offered. But the documentation is so sparse. . . . Herodotus's evaluation is often cited: It "Miletus during the same period had reached the peak of her prosperity and was the

glory of Ionia" (V.28♦). But this statement must be placed in context. Herodotus records that some time earlier the city had in fact been torn by civil disorder, which was settled by Parian arbitrators. The discussion clearly shows that in Herodotus's eyes (V.29) the supposed wealth arose solely from planting crops again on land that had previously been laid waste—nothing more. If Aristagoras applied to Artaphernes to lead the expedition against Naxos, it was because Miletus was incapable of bearing the expense by itself (V.30–35). Clearly, Miletus was not "wealthy" enough for it to pursue an independent policy.

Once Histiaeus had returned to Miletus (as always, according to Herodotus), he explained to his compatriots why he had urged Aristagoras to pursue revolt, as follows: "Darius had been planning a transfer of population, intending to settle Phoenicians in Ionia, and Ionians in Phoenicia" (VI.3♦). This passage is sometimes cited to claim that the Persians, after conquering the Mediterranean front, had systematically favored the Phoenicians over the Greek dependencies and that this policy had caused the commercial ruin of the Ionian cities. But this interpretation is not based on any independent sources. For one thing, Herodotus does not conceal the fact that he believes that this explanation is incorrect. For another, we could just as easily suppose that the satrapal courts of Asia Minor created a market that profited the craftsmen of the Ionian cities (see, for comparison, Herodotus VIII.105). And it seems likely that a not insignificant portion of the Greek pottery imported to the Near East was at this time coming from the cities of Asia Minor. Greco-Phoenician competition, which is often made much of, must not be overestimated, no matter how important their political conflicts were in attracting the favor of the Great King (cf. VIII.90). The king never chose one or the other as a privileged commercial partner! A remarkable, recently published (TADAE C.3.7) Aramaic document from the time of Xerxes (475) attests that Ionian and Phoenician merchants could be found side by side in an Egyptian port and that, at several sites, Phoenician and Greek pottery types are mixed. Besides, the Ionians also encountered competition in the Greek world, particularly from the Athenians, who during the sixth century had progressively won some of the Aegean trade from the Ionians, in the northern regions. But it is not possible to analyze the consequences of this competition for the economic position of Miletus and other Ionian towns with any precision.

Civic Tensions and Achaemenid Power

What is most surprising is that the troubles arose around 500, whereas conditions might have been more favorable earlier on, during the great upheavals of 522–520 (when Darius came to power), for instance, or during the Scythian expedition (503), for another. While it is true that, during the accession of Darius, Oroetes' power hardly presented conditions that were amenable to the awakening of movement away from the Persians in the Greek cities of Asia Minor, Herodotus explicitly states that, during Darius's Scythian expedition, the Ionian tyrants, who were powerfully pressured by the Scythians to abandon Darius, seem to have had all of the requisites in hand to choose the path of secession. It was this path, according to Herodotus, that was proposed by Miltiades the Athenian, "master of the Chersonese on the Hellespont and in command . . . they should take the Scythians' advice, and so liberate Ionia" (IV.137–38♦). Histiaeus of Miletus (still according to Herodotus) tried to use arguments for democracy to convince his colleagues to secede:

Each one of them owed his position as head of a state to Darius, and in the event of Darius' fall, he himself would be unable to maintain his power at Miletus, and all the rest of them would find themselves in a similar difficulty. Each state would be sure to turn against absolute government, and agitate for democracy. (IV.137◇)

Herodotus's version is not free of imprecision (the role of Miltiades, for example) or anachronism. It is clear that here he puts in Histiaeus's mouth an argument that was actually used by Aristagoras at the beginning of the revolt. This indicates at least that, from Herodotus's point of view, the Greek cities at this time faced an internal political problem, which was closely linked to the relationship they maintained with Persian power. This debate throws singular light on the nature of the contradictions within which the Greek tyrants found themselves, caught between two irreconcilable ambitions: liberation from Persian protection and retention of their own power.

The measures taken by Aristagoras at the beginning of the open rebellion are presented by Herodotus as follows. After having seized the commanders who had participated in the expedition to Naxos, he made the following decision (V.37–38◇):

To induce the Milesians to support him (*hekontes*), he began by pretending to abdicate his own position in favour of a democratic government [isonomy], and then went on to do the same thing in the other Ionian states, where he got rid of the political bosses. Some of them he drove out; those he had arrested on the ships which had joined his expedition to Naxos he handed over to the cities to which they respectively belonged, hoping thereby to get the goodwill of their former subjects. At Mytilene, Coes was taken out and stoned to death the moment the people got their hands on him; at Cyme, however, Aristagoras was allowed to go free, and most of the other cities showed a similar leniency.

Right away we find Herodotus passing judgment without compassion on Aristagoras, in whose democratic fervor he does not believe for a moment ("by pretending"). But, aside from this, his presentations of the situations of 513 and 499 are based on his conviction that an absolute connection existed between the tyrants and Achaemenid authority. From the time that the Achaemenids took power, the expulsion of the tyrants was a prerequisite for rebellion. And, on this point, it is difficult not to agree with Herodotus. To be sure, not all of the tyrants were imposed by Achaemenid intervention. When Histiaeus left for Susa, it was his son-in-law and cousin Aristagoras who took over (V.30). This illustrates the fact that transmission of the job of tyrant proceeded along family lines in the first place. At the same time, as Histiaeus says, it appears clear that the dominion they exercised over their respective cities was directly connected to the support given to them by the Achaemenid power. At any rate, most of the tyrants driven away by Aristagoras's actions immediately turned to the Persian camp (VI.9–10), where they provided the Persians with inside information (cf. VI.13). In the eyes of the Ionians, the dominion to which they were subject was exercised jointly by the Persians and their tyrant (VI.21). The situation was the same in Cyprus: as soon as his brother Onesilus took power and rebelled against the Persians, Gorgus, the king of Salamis, "transferred his allegiance to Persia" (V.104◇). When Herodotus writes that after the Persian victory "the people of [Salamis] restored [it] to their former ruler Gorgus" (V.115◇), he is saying that the power of Gorgus was legitimate (with respect to the monarchic traditions of Salamis), but at the same time he shows that this legitimacy could not be restored without the assistance of Persian military might.

Of course, we cannot see any underlying ideological preference on the part of the Persians, who had simply decided during one period in the history of the Greek cities

that alliance with the tyrants was the best way to establish their own dominion. From this point of view, the policy pursued by the Persians in Asia Minor was not fundamentally different from the policy that they followed in the other conquered countries—to support the local elites, as long as they agreed to play the game. But, at the first offense, the king could fire them and name other, more submissive leaders. Furthermore, Darius's policy regarding the sanctuaries of Asia Minor does not seem to have differed essentially from his policy in Babylonia, Egypt, or Judah (chap. 12).

The Naxos affair shows that the power of the great families, from which the tyrants of Asia Minor came, was threatened by popular pressure; then the representatives of this "great" party were removed by the people (*dēmos*; V.30). Whatever the exact sociological realities reflected by Herodotus's words, it is clear that Naxos had just undergone a democratic (or isonomic, the difference is not important here) revolution. These democratic or isonomic tendencies in Asia Minor did not appear suddenly, since, for example, around 575–550, an inscription attests to the existence of magistrates and a "popular" assembly at Chios (ML 8). It is also possible that the nearby example of Athens ("Cleisthenian revolution") had again induced the will of the "people" to undo the "tyrannical" protection of the great families. Under these conditions, Aristagoras understood that, to have some chance of success, they had to enlarge the social bases of the rebellion, and in order to do this, they had to give in to the "isonomic pressure" (which, obviously, Miletus also felt, as Herodotus suggests; V.28–29). This policy also allowed Aristagoras to take control of operations: by asking each town to name *stratego*i ('generals'), he could be reasonably sure that these *stratego*i would henceforth operate under his direction.

This decision attests to Aristagoras's political cleverness. The tyrants of 513 made the best choice they could between external dependence and internal democracy. At this time (513), "the liberation of Ionia"—a slogan allegedly defended by Miltiades, though we do not know what motivated him to say this—was certainly not an effective mobilizing slogan any more than it was in 500. In other words, it is not possible to explain the genesis of the Ionian revolt in terms of a (nonexistent) "national consciousness" or in terms of a "hereditary enemy" (i.e., "the Persians have always been our enemy"), two concepts that were forged later in Greece by polemicists such as Isocrates. The Ionian attitude toward Persian dominion was not determined solely by perceiving the Persians to be culturally different. Instead, and more importantly, it was determined by the social status of each group within the context of the Greek city and by the efforts these groups put forth to advance their interests. Aristagoras was able to carry this thought to its logical conclusion: to make war on the Persians presupposed that the social groups who up until the present had been excluded from power were now included. It is appropriate to add a closing remark that allows us to establish another link between internal tensions and revolt against Persia. The remark is fostered by the measures taken by Artaphernes at the end of the revolt. Herodotus states very clearly that "these measures were conducive to peace" (VI.42♠). Given that they related essentially to the idea of tribute (and not just to its amount: chap. 12/5), we are led to think that the exacting of tribute within each city had posed or, more precisely, revealed or even exacerbated internal social tensions. This was a process perhaps not greatly removed from the process in Judah fifty years later (Neh 5:1–3; see below, chap. 14/5): the inequable exacting of tribute from the rich and poor perhaps played the role of accelerating political and social tensions. In the case of the Ionians, at any rate, supporting the revolt promoted a hope for an end to this external pressure and the consequent internal sociopolitical pressure.

The Strategy of Aristagoras: The Beginnings of the Revolt

Supposing that the preceding interpretations partly or fully reflect the truth, we still need to understand why and how, at that particular moment, Aristagoras raised the banner of revolt. To this end, we must first return to the story of the expedition to Naxos. Early on, there was no question of not cooperating with Artaphernes (the satrap of Sardis). Because all of the ships were under the command of Persian captains, Aristagoras's first move was to seek the aid of Artaphernes. The Naxians who were exiled from their island promised financial contributions, and these are the terms under which Aristagoras approached Artaphernes. Upon notification of the mobilization, other towns were required to send oarsmen to the royal fleet. Of course, from the beginning, the alliance betrayed contradictory agendas. Aristagoras hoped to gain in prestige from it; Artaphernes, on the other hand, knew well that the expedition was a Persian expedition, ordered by the king, with a real Achaemenid objective—to take control of an island that Aristagoras represented to him as the key to the Cyclades (V.31). Very quickly, mistrust arose between Aristagoras and the Persian head of the armada, Megabates. It increased some time later, when the Persians found themselves short of money (V.34). In fact, it is likely that, as was customary, Artaphernes had received strict orders from the central authority that released a specific amount of funds calculated on the basis of the number of ships and soldiers conscripted and the expected duration of the expedition.

It was at this moment, according to Herodotus, that Aristagoras decided to revolt. For this, Herodotus provides only explanations of a personal nature. He adds that Aristagoras had received instructions regarding a revolt from Histiaeus, still in his gilded cage in Susa. But the story he gives is highly suspect (V.35♦). In no way was Aristagoras unaware of the superiority of the Persians. The Greeks' only hope—as Hecataeus puts it, but surely Aristagoras was also aware of this—was to take the offensive on the sea: Hecataeus “advised them to work for control of the sea.” The only solution was to seize the Persian fleet which, after its unhappy return from Naxos, had just berthed at Myus. Aristagoras was sent to Myus to seize the captains of the ships (i.e., the tyrants who had contributed to the Naxos campaign), and most certainly also to seize the ships by making a daring attack on the naval base. But in seizing the royal fleet, the Greeks also had to settle the budgetary problem. The maintenance of a large armada (perhaps 200 ships) was very expensive (we can estimate the cost as at least 60 talents a month, not counting maintenance and repairs). The Persians had solved the problem by conscription and tribute. The expense is the reason Aristagoras proposed that they seize the treasuries of Didyma: “If that were done, he had good hope that they might succeed in gaining command of the sea” (V.36♦). His proposal was rejected. “They did decide, none the less, to throw off the Persian yoke,” says Herodotus.

Though Aristagoras's strategy seems to make sense so far (or at least, if the modern historian can give it meaning!), it is hard to understand why, upon his return from Europe (where he had won the cautious support of Athens and Eretria), he decided to begin an expedition against Sardis after mooring the fleet near Ephesus. The Greeks arrived without mishap near Sardis, thanks to Ephesian guides, who led them by roundabout paths. However, they proved unable to capture the fortress, whose virtually impregnable position is stressed by all of the ancient sources—at any rate, it was inaccessible to a small, hard-pressed troop lacking siege engines. Aristagoras must have been aware that in a very short time Artaphernes would be able to raise mounted troops, “all the Persians stationed west of the Halys” (V.102♦). That is, the army reserve would

be sure to advance from the lands awarded to Persian nobles of the imperial diaspora, and, indeed, they did respond: the Greeks had to flee in disorder toward Ephesus before the survivors of the combat were even able to disband (V.102). Shortly, Athenians and Eretrians abandoned the Ionians, who had to face the Persians alone (V.103).

If, taking the opposite tack from Herodotus, we postulate that Aristagoras was not crazy, then we must recognize that he had good reasons for acting as he did. For one thing, we should note that he put on the line only a very small part of his forces: the fleet and the soldiers it carried were intact and ready for other battles. Could not the reason for the attack on Sardis be related to an urgent need to give a signal to the populations of Asia Minor? They could not help but be impressed by an offensive so unprecedented that no parallel can be found in the entire history of Persian dominion in Asia Minor, other than Agesilaus's attempt a century later and another led by Alexander more than 160 years later (under very different conditions). In other words, we are suggesting that Aristagoras would have had no illusions about the military effectiveness of the undertaking but that most of all he hoped to gain political advantage from it. The fact remains that the Greek fleet quickly made a veritable propaganda tour of the Asia Minor coast, from the Hellespont to Caria. A large portion of the peoples and cities joined the rebels (V.103), as did all of the Cypriot kings, except the king of Salamis, who fled to the Persians, and the king of Amathus, who was soon besieged by the other Cypriot forces (V.104). The Persians soon won a land victory on Cyprus (aided by the defection of some Cypriot contingents), but the royal Persian fleet, comprising Phoenician contingents, was defeated by the Greeks (V.108–114), and the Ionian fleet then retook Ionia (V.115).

It is also possible that by the incursion of a Greek army at Sardis Aristagoras hoped to damage the prestige and authority of Artaphernes. Herodotus speaks of dissensions in the court at Sardis in a chronological context of the mysterious return of Histiaeus, just after the attack on Sardis by Aristagoras (V.105–7). Herodotus's chronology is suspect, however, and what he says about the Sardis political situation may be pertinent to an understanding of Aristagoras's motives for an attack: Histiaeus sent letters to the Persians who were found in Sardis, as if to men with whom he had previously had conversations on the subject of rebellion. But the intrigues were discovered by Artaphernes, and this time he put a great number of Persians to death (VI.4). Regardless of the uncertainties surrounding these events, they do explain the dissensions that surrounded Artaphernes. It is likely that, although he was the king's brother, he had received less than favorable correspondence from Darius and he no longer had the total confidence of all of the Persians, who must already have been frustrated by the Ionian raid, which implied failure on the part of the intelligence services. It is in any case the first attestation of this kind of atmosphere in the satrapy's leadership circle after the Otanes affair. The execution of numerous Persians is evidence of deep differences over the strategy to follow.

The Persian Victory

We may assume that Aristagoras's plans, whatever they were, so far had gone fairly well. But the problems posed above remained. For one thing, except for a quick defeat in Caria, the Persians retained absolute supremacy on land. Several detachments of troops moved toward the coastal towns, rapidly seizing ("one each day"!) very important ports—Abydos, Lampsacus, Clazomenae, Cyme, and others (Herodotus V.116–17, 123). This deprived the Greeks of the harbors and open ports essential to the fleet, which had

to find water and supplies as well as shipyards for repairs (cf. Arrian, *Anab.* I.18–19). Never were the Greeks able to set foot on the Asian continent again. Histiaeus tried to disembark later on, when he left Lesbos, in order to get wheat in the rich territory of Atarnaeus. However, he was defeated by “Harpagus, who was in the neighbourhood at the head of a large army” (VI.28♦). The superiority of the Persian cavalry was total. Only Agesilaus, a century later, was able to challenge it, however ephemerally, by raising a cavalry in the Greek cities and so providing a way “of not hav[ing] to carry on a skulking warfare” (Xenophon, *Hell.* III.4.15♦).

As noted above, the pursuit of naval operations presupposes one has settled his budgetary problems. For this reason, Herodotus says, Aristagoras summoned a council: he “realized that he had no chance against Darius.” Herodotus uses this occasion to resume his attacks on Aristagoras, whom he accuses of laying the ground for his own flight (V.124♦). Actually, the tyrant proposed to take Myrcinus in Thrace, where Histiaeus had received a territorial grant from Darius in 513. Against the advice of Hecataeus he took to the sea and died after a battle against the Thracians, whose town he had besieged (V.126). No doubt by this means Aristagoras intended to get his hands on fresh resources of wood and money that would allow him to fund the war by sea (cf. V.23). This moreover is the same reasoning followed by Histiaeus when, preparing for his return to Miletus, he resolved to attack Thasos, which was also renowned for its rich mines (VI.28). Previously, he had attempted to get himself back on the water by requisitioning the merchant ships that plied the Bosphorus (VI.5). It is still more remarkable that in 494 the Greeks were still able to put into service 353 triremes, according to Herodotus. However, by then the Persians had had the time and means to rebuild a fleet of 600 ships with the help of contingents sent by the Phoenicians, Cypriots, Cilicians, and Egyptians (VI.6–9). Even though Herodotus’s numbers must be taken with a grain of salt, they at least communicate the inequity in forces. The Greeks had obviously thrown the last of their resources into the one battle, because they knew all too well that the outcome would decide the war (VI.6–9).

The Ionians did not have adequate financial resources or excel in unity, despite efforts put forth by Aristagoras at the beginning of the revolt to get a unified command under way (V.38). Several times the Ionians clearly tried to revive the earlier Ionian League artificially, as their meetings at the Panionion (the festival of the Ionian cities) show. This was obviously done with no great success or conviction, the more so because on the one hand not all the Ionian cities were engaged in the combat and on the other because Aeolian and Carian cities had taken part. The battles on Cyprus had already shown that it was every man for himself. Stesenor of Curium, for instance, did not hesitate to switch to the side of the enemy in the middle of a battle (V.113). When at the end of the operations the Persians decided to concentrate their forces against Miletus, the Greeks met one more time at the Panionion. It was there decided to abandon the mainland (the Milesians were left to defend their walls alone) and to gather the fleet at the island of Lade, opposite Miletus. The unified façade quickly crumbled under threats from the Persian generals and under the influence of the tyrants who accompanied them. The fighting spirit that the commander Dionysius tried to instill in his troops rapidly faded, with the soldiers refusing to undergo the difficult discipline he tried to impose on them (VI.12). Under these conditions and faced with increasing disunity, the Samian part of the coalition lent a friendly ear to Aeaces, the old tyrant of their island who had been

deposed by Aristagoras, and were persuaded that they could never defeat the Persians. The plaints put in the soldiers' mouths by Herodotus evidence deep discouragement (VI.12). We must observe in this regard that the people were probably exhausted, considering the abandonment of the fields (frequent levies of men as soldiers and oarsmen), ravages of war (the Persians held the flatlands: VI.28), and doubtless also the financial pressure (enormous budgetary needs), which probably conceded nothing to the burden of Persian tribute! All in all, Herodotus remarks, the Samians preferred to return to the joint dominion by the tyrant Aeaces and the Persians. He mentions that the Milesians, on the other hand, were, some time later, against returning to Histiaeus: "the people there had had a taste of liberty and were too well pleased to have got rid of Aristagoras to be willing to welcome another ruler of the same stamp" (VI.5♦). The fact remains that, during the battle engaged by the two fleets near Miletus, a large portion of the Samian vessels left Ladian waters, followed by others: "Most of the allies defected." At least this is Herodotus's version (VI.9–15), who, it is true, harbored no sympathy for the Ionians.

It was soon Miletus's turn to surrender. Besieged by land and sea, the inhabitants had no chance in the face of enemies who had long been masters of the art of siege (VI.18), as they had already demonstrated at Barca (IV.200) and Cyprus (V.115–16): "Five years after the revolt of Aristagoras, [the Persians] made themselves masters of the whole city" ([493] VI.17♦). The last pockets of resistance were mopped up in a relatively short time. Some Carian cities that were still armed folded under the weight of the Persian armies (VI.25). And, at the beginning of 493, the royal fleet took to the sea again and subjugated the last of the holdouts one by one: "In this way," remarks Herodotus, "the Ionians were reduced for the third time to slavery—first by the Lydians, and then, twice, by the Persians" (VI.32♦). Soon, Artaphernes took appropriate measures to restore the stability of Persian dominion in the cities, while maintaining the appearance of their autonomy (chap. 12/5).

4. From Thrace to Memphis (492–486)

The Mission of Mardonius in Thrace

Herodotus records that, in the spring of 492, the king recalled the generals in command in Asia Minor and sent there his son-in-law Mardonius, son of Gobryas. From Cilicia, Mardonius sailed all the way to Ionia, while the army reached the Hellespont overland. When they were reassembled, the Persian forces crossed the Hellespont and were soon operating in Thrace. After a few months, Mardonius returned to Asia Minor, as the result of a campaign Herodotus considers disastrous: his fleet was lost in a storm near Mount Athos and his land army suffered heavy losses to the Brygian peoples. Later, Herodotus even states that Darius relieved Mardonius of his command, for his expedition had had little success (VI.94). But we must note that in Herodotus's opinion the mission entrusted to Mardonius by Darius had been to take Athens and Eretria—obviously because of the aid these two cities had provided to the Ionians in 499. Against this background, the results achieved by Mardonius could hardly be taken as anything other than laughable. This is Herodotus's very personal interpretation: he was eager to incorporate Mardonius's campaign into his broad view of the Persian Wars. He himself adds right away that this was just a pretext: "The Persians intended to subjugate as many Greek towns as they could" (VI.43–45♦). To understand the strategy of Darius, it is important to place it in the broader context of the years 513–492. The conquests in Thrace

that had already been achieved, at the instigation of Megabazus and Otanes, were considerable, as we have seen. But they remained relatively fragile because, beyond the regions that were securely held by powerful garrisons, many territories remained *de facto* outside Persian dominion. Even though we do not have absolute proof, there is hardly any doubt that Thrace and perhaps Macedonia had taken advantage of Persia's difficulties in 499–493 to loosen their bonds. In this perspective, the mission entrusted to Mardonius was at first nothing but the reconquest of the Hellespont and the Propontis in 493–492. Once control of the straits was reasserted, he could retake and more solidly affirm the imperial presence in Europe.

Despite occasional reverses (and a wound received by Mardonius himself), the results must not be underestimated. For one thing, the Persian army “added the Macedonians to the list of Darius’ subjects” (VI.44♦). Macedonia was thus no longer simply a protectorate set up by Megabazus, but a conquered country. Actually, Alexander I retained the throne but now was a subject-king, liable for tribute and other assessments. The conquests achieved beyond the Strymon River explain the situation of 480, as Herodotus describes it: “The whole country as far as Thessaly had been forced into subjection and made tributary to Persia by the conquests, first, of Megabazus and, later, of Mardonius” (VII.108♦). However, while wishing to present the fight with the Brygi as a defeat of Mardonius, Herodotus does not conceal the fact that the reality was quite different: “In spite of their initial success, the Brygi were not to escape a crushing blow” (VI.45♦). The implication is that other Thracian peoples were then subjugated. Finally, Herodotus mentions that Thasos surrendered without a fight (VI.44). He confirms this in the story of Xerxes’ expedition, where he mentions that, among the peoples of the interior, only the Satrae were then free: all the others sent a contingent to Xerxes (VII.110–11). The “Persian governors [who] held appointments in Thrace and on the Hellespont” (VII.106♦: before 480) probably date to this period. After preparations for the expedition of 480, the Persians were able to set up stores of grain and flour in several places: Leuce Acte in Thrace, Tyrodiza (in the country of Perinthus), Doriscus, Eion, and Macedonia (VII.25). And there is nothing to suggest that during these years the Persians experienced any rebellions in the region.

The following year, Darius was able to complete the conquest begun by Mardonius. Without having to dispatch an army, he sent a message to the Thasians, who had been accused by their neighbors (the Abderans?) of rebellion, “to the effect that its defences should be dismantled and its fleet brought across to Abdera” (VI.46♦). On this occasion, Herodotus states that the Thasians had laid the keels of numerous vessels, thanks to the resources they drew from their property on the mainland and mines: 200 talents per year in all. “The islanders obeyed Darius’ order, pulled down their fortifications and sent their whole fleet over to Abdera” (VI.47♦). The Abderans were faithful subjects of the Great King (VIII.120), and Abdera was probably a Persian naval base. This episode confirms that Persian dominion was firmly established at this date: it obviously never occurred to the Thasians to turn a deaf ear. In this way, the Persians obtained access (either directly or via taxes) to the Thasian mines.

From Cilicia to Marathon

The order given to Thasos also meshed with the preparations that the Great King began the following year (491). While royal heralds were sent to ask for “earth and water”

from the Greek cities, Darius began the mobilization of his naval forces, instructing his coastal subjects to build long ships and transport vessels (VI.47, 95). The land troops and the fleet were concentrated in Cilicia, under the command of Datis and Artaphernes, son of Artaphernes satrap of Sardis, and thus Darius's nephew (VI.94–95). Departing from Samos, the Persians navigated through the islands up to and including Eretria (VI.95–102). Then came the debarkation on the plain of Marathon, the defeat, and the return to Darius (VI.102–119). This, in skeleton form, is the story Herodotus tells of what is customarily called (from the Greek point of view) the First Persian War.

Herodotus records the orders given to Datis and Artaphernes as follows: “To reduce Athens and Eretria to slavery and to bring the slaves before the king” (VI.94♦). Logically, he concludes his tale with the coming of Datis and Artaphernes before Darius, leading the Eretrians “in defeat” (VI.119♦). The king's desire for vengeance against Athens and Eretria is a recurrent motif in Herodotus (and many other ancient authors following him). Herodotus dates it to Darius's learning of the Greek raid on Sardis (V.105). According to his version, vengeance became a veritable obsession for Darius (VI.94; cf. Athenaeus XIV.652b–c and Plutarch, *Mor.* 173c). Combined with the later exaltation of the battle of Marathon by the Greeks of the fifth and fourth centuries, this interpretation has done not a little to implant the idea that the primary objective of Darius in 491 was to destroy the Greek sanctuaries (particularly the acropolis of Athens), which were designated objects of reprisal for the destruction of the temples of Sardis in 499 (V.102) and, only as a side effect, to conquer Greece.

The Conquest of the Islands

For clarification, it will suffice to reprise events in order. As usual, Herodotus brings his bias to the historical reconstruction. He feels constrained to explain why the Persians chose to head from Samos to Naxos instead of sailing for the Hellespont and Thrace (as Xerxes was to do later on), since this route was clearly difficult to reconcile with a Persian desire to conquer Greece. Naxos “was now their first objective in the war,” he writes, stating that it was essential for them to conquer an island against which they had failed in 500 (VI.96♦; cf. V.34). It is necessary at this point to recall the speech that Aristagoras had then addressed to Artaphernes (according to Herodotus): starting from Naxos, the Persians would be able to conquer other islands, the Cyclades (Paros, Andros, and others), and to press as far as Euboea without difficulty (V.31). This is exactly the program that Darius assigned to Datis and Artaphernes in 490. Despite Plutarch's denials (*Her. Mal.* 36 [*Mor.* 869]), Naxos was taken without difficulty, its temples and the city burned, and the inhabitants taken prisoner (VI.96). Then the fleet followed a course from island to island, past Delos, Carystus, and the rest of Euboea (VI.97–101). Cities that resisted, such as Carystus, were harshly punished. Despite the aid of Athenian colonists, Eretria was also forced to surrender: “The Persians there pillaged the temples and set them on fire, avenging the burning of the sanctuaries of Sardis, in conformity with the orders of Darius” (VI.101). Thus, contrary to what Herodotus would have us think, the journey via Naxos was not a detour, but rather the first objective in the conquest of the islands. Darius's objective obviously was to wipe out any competition on the seas. We do not know the precise status of the islands that were thus conquered. There is no doubt, however, that they were required to pay tribute and to send military contingents (cf. VI.99).

In sum, on the eve of the landing in Attica—and the defeat at Marathon did nothing to change this—Darius intended to follow a strategic design through to its logical end,

a design that began with the conquest of Samos shortly after his accession. The Scythian-Thracian expedition of 513 (and the following years), expansion of maritime dominance after the Ionian revolt, and then Mardonius's 492 expedition represented further stages in a vast project intended to insure Persian dominance over the Aegean Sea—not just the shores, but the islands as well.

This conquest also marked an essential step in Thucydides' mind. Cyrus, he writes, had subjugated the towns of the continent, but Darius was in a position to seize the islands, thanks to the might of his fleet (I.16.1). Like Polycrates (tyrant of Samos), whom he succeeded, in a sense, as "king of the seas" (I.13.6; 14.2), Darius marked his power by posing as protector of Delos. He had in fact given strict orders to Datis to take care not to land at Delos itself but at Rhenea. The Delians, who had fled to Tenos at the news of his arrival, were assured that they would be able to return home alive, safe and sound: "Datis followed the message by piling three hundred talents-weight of frankincense upon the altar, and burning it as an offering" (Herodotus VI.97♦). Datis's expedition was also a sort of propaganda tour, intended to show the islands that they had nothing to fear from the new master. Herodotus himself records that, on his return, Datis "sailed in his own ship to Delos" to restore a golden statue of Apollo that a Phoenician sailor had stolen from a Theban sanctuary (VI.118♦). Here we can see the two complementary sides of Persian ideological strategy: patronage granted to the sanctuaries but pitiless repression in case of refusal to submit. Only recalcitrant cities saw their sanctuaries destroyed.

Persian Conquest and Greek Medism

The Persians were able to glean an additional piece of information, or rather a confirmation, from their island campaign. This was that, in the face of Persian aggression, the Greeks did not have a unified patriotic hatred of "barbarians." This was an observation that their experience with the Greeks of Asia Minor had long ago recognized as a certainty. Just as disunified as their companions who had settled on the coast of Asia Minor, the insular Greeks provided the proof. Herodotus records that after six days of siege, Euphorbus and Philagrus, two persons of note (i.e., of wealth) from Eretria, "betrayed (*prodidousi*) the town to the enemy" (VI.100♦). These two people were rewarded by the king, who gave them a grant of land, doubtless in Asia Minor (Plutarch, *Mor.* 510b; Pausanias VII.10.2). This was another example of the exchange of gifts for services rendered between the king and the Greeks that had begun in Cyrus's time (Athenaeus I.30a) and that was to multiply many times later on.

Obviously Datis was also counting on the "Medism" of certain Athenians for the successful outcome of his plans. In fact, Herodotus's discussion leads us to believe that the landing in Attica had a political objective, to install a man in Athens who was devoted to Persian interests. Before Datis, the role of Hippias, son of the tyrant Pisistratus, was quite noteworthy in this regard. He was the one who chose the plain of Marathon (VI.102) and directed the landing and encampment operations (VI.107). The reason obviously was that he was well placed to play a role as military adviser. It was also because over several years he had become one of the most influential political advisers among the Persians. Herodotus depicts him urging the satrap Artaphernes against Athens (V.96). His participation in the expedition was no doubt because he had persuaded Darius that he could reinstall a pro-Persian tyranny in Athens. He certainly knew he could count on allies in the city. Herodotus, strongly denying that the guilty party was of the Alcmaeonid family, records that after the battle of Marathon a signal was sent from Athens to the Persians,

indicating that the way to the city was open (IV.115). The signal would have to have been sent by Athenians favorable to the return of Hippias (IV.121). There are no compelling reasons to reject this statement. From multiple sources, we know that there were “friends of tyrants” in Athens. One of them had been elected archon in 496 (Aristotle, *Ath. Pol.* 22.4). Furthermore, the speech Herodotus puts in the mouth of Miltiades (who commanded the Athenian forces) expresses the moral and political uncertainty of the Athenians. Urging the Athenians to join battle without delay, Miltiades insisted that if they waited to do so, they risked “a wind of discord blowing the Athenians toward the Medes”; he also urged them not to wait “until there was something rotten among the Athenians” (VI.109). Herodotus also describes the feeling of terror that the mere mention of the Medes inspired, because their numerous victories were known (VI.112).

Marathon

Datis recalled Darius’s orders and, with the advice of Hippias and with great confidence, had his troops disembark on the plain of Marathon. “The part of Attic territory nearest Eretria—and also the best ground for cavalry to manoeuvre in—was at Marathon.” As soon as the Athenians heard the news, they and the Plataeans left for Marathon (VI.102–3♦). The Spartans, on the other hand, despite urgent applications made to them, pleaded a ritual feast that forbade them to leave their territory. They would not arrive at Marathon until several days after the battle (VI.105–6).

Herodotus devotes just a few very short pages to the battle proper, which is why Plutarch reproaches him for “detract[ing] from the victory” (*Her. Mal.* 26♦ [= *Mor.* 862b]). In fact, the account is so condensed that major uncertainties remain about the forces involved. The figures offered by Herodotus are entirely suspect, since they concern the number of ships in the royal fleet: 600 (VI.95); and the number killed: 192 Athenians and 6,400 soldiers of Datis (VI.117). One of the most essential details concerns the absence of the Persian cavalry. Its presence in Datis’s expeditionary force is beyond doubt (VI.48–95; cf. Pausanias I.32.7). An entry in the *Suda* (s.v. *Khōris hippeis*) indicates that the cavalry had been positioned separately. Shall we conclude from this that they had been instructed to take control of the road to Athens? It is difficult to say. It is no less difficult to understand how Datis could have passed over the factor that made every Achaemenid army superior, especially since Herodotus even states that the plain of Marathon had been chosen because there the cavalry could be deployed with ease.

It is true that the Achaemenid infantry was far from negligible. As was the custom, Datis placed his best soldiers, the Persians and Sacians, at the center of his formation (VI.113). Herodotus remarks that on the other side the Athenians “were the first Greeks, so far as I know, to charge at a run” (VI.112♦). This was in fact the only way to limit the devastating power of the Persian archers, even if some soldiers had to perish in the course of the assault. The Persians prevailed at the center but were penetrated at the wings. They were forced to reboard their ships. Datis attempted to sail quickly for the anchorage at Phalerum, but the Athenians had had the time to ready the city for defense. Datis did not persevere and set sail for Asia Minor. This surprising decision confirms the fact that at this time Darius did not intend to establish long-term dominion over Greece. Datis was simply charged with making a raid, destroying sanctuaries and houses, taking prisoners, and setting sail for the coasts of Asia Minor. In sum, from the Persian point of view, Marathon was nothing but a minor engagement that had no effect whatever on the

Aegean strategy defined by Darius. This was surely the version found in Achaemenid propaganda (cf. Dio Chrys. XI.148).

It is easy to understand why and how the Athenians transformed Marathon into a memorable victory. In later times, it acquired truly mythic force in the collective consciousness of the city. In 490, the victory of the citizen-hoplites signified the reinforcement of a democracy acquired recently and with difficulty; it also enhanced the town's political and military prestige in the eyes of Sparta and the Peloponnesian League. But it was viewed quite differently by the Persians. As has already been said, Darius had attained his fundamental objectives. At any rate, the repercussions of the victory do not seem to have spread beyond the local region. Certainly the Greeks of Asia Minor, who had barely survived a terrible repression, saw no sign of the weakening of Persian dominion in the battle of Marathon. On the contrary, they understood perfectly well that Darius's power had never been greater. The only hint of insubordination is mentioned in the article already cited in the *Suda*: the Athenians were supposedly kept abreast of Datis's tactical dispositions by Ionians in the Persian army. If this information is true, it obviously refers only to a small group acting in the utmost secrecy. Nothing is ever said about anti-Persian activities among the Ionian or Aeolian contingents that Datis brought with him (VI.98).

From Marathon to Memphis

According to Herodotus, Darius immediately drew up a new expedition, which he himself would head, against Greece. To this end, mobilization orders were sent everywhere, "and the whole continent was in uproar for a space of three years" (VII.1♦). It was then (486) that news of an Egyptian insurrection arrived at the court. Darius was preparing to put this insurrection down when he was seized by an illness, in November (VII.4; Ctesias §19). Unfortunately, we have no information on either the causes or the extent of this revolt (Ctesias has nothing to say about it). Herodotus's brief reference is at least a reminder that the Achaemenid history of this period cannot be reduced to the Greek problem. But it also confirms, to the despair of the historian, that in the eyes of Herodotus all that really counted was the Greek perspective on the Persian Wars.

Whatever the case, when Darius died, the Achaemenid Empire had achieved its greatest extent: from the Iaxartes to the Persian Gulf and the First Cataract, from the Danube to the Indus. At the same time that he was pursuing his conquests, the Great King was multiplying reforms and measures pertaining to the organization of Persian authority, both in the center and in the conquered countries.

PART TWO

The Great King

Chapter 5

Images of the World

1. The Builder-King

The Remodeling of Susa

Darius was anxious to exalt his new power and transmit its glorious testimony to posterity; this was expressed in intense building activity, and quite early on he and his advisers conceived the founding of new royal residences at Susa and Persepolis. The urban plan of Susa had undergone no change since Cyrus's conquest and retained the configuration that it had in the Elamite period. The archaeological evidence does not reveal a single irruption of Achaemenid culture until Darius's reign. Then we encounter a sudden change, with the indexes of Elamite culture disappearing suddenly. We can in fact observe a complete redoing of the city around great tells dubbed the "Acropolis," "Royal City," and "Apadana," which overhang the east bank of the Shaur by about 20 meters (fig. 9).

The reasons Darius chose Susa are given as follows by Strabo:

The Persians and Cyrus, after mastering the Medes, saw that their native land was situated rather on the extremities of their empire (*ep'eskhatois*), and that Susa was farther in and nearer to Babylonia and the other tribes, and therefore established the royal seat of their empire at Susa. At the same time, also, they were pleased with the high standing of the city and with the fact that its territory bordered on Persis, and, better still, with the fact that it had never of itself achieved anything of importance, but always had been subject to others and accounted merely a part of a larger political organization, except, perhaps, in ancient times, in the times of the heroes. (XV.3.2♦)

This text attests above all to the paucity of information available to Strabo about both the chronology of the refounding of the city and the ancient history of Susa and Elam "since the time of the heroes." Only a Greek writer could consider the location of Persia peripheral in the new Empire. In fact, Strabo himself emphasizes (XV.3.3) that the Great Kings were not uninterested in Persian palaces (Pasargadae and Persepolis). Taken in historical context, this decision is better understood as the result of continuous relations between Elam and the high country of Anšan: the construction of the palace at Susa made the victory of the Persians and the unification of the two entities into a single entity evident to everyone. At the date when we think it was undertaken, the labors at Susa also bear witness to the refashioned unity of the Empire around Darius, restorer of the order that had been disrupted by the rebel lands.

The epigraphic record of Darius's activities as a builder is rich. The king appears as both the extender and the restorer of the preceding dynasties, which he does not name. He boasts of rebuilding constructions that had fallen into ruin, particularly fortifications:

Darius the king says: by the grace of Ahura-Mazda, I completed numerous constructions that previously had been left unfinished. I saw the fortifications at Susa that had been previously constructed fall prey to age; I rebuilt them. These are (in fact) quite other fortifications that I myself have built. (DSe 001)

He insists above all on the profoundly novel character of his initiatives:

At the location where this fortress was built, no other fortress had ever been built. By the grace of Ahura-Mazda, this fortress I built. And, since it was the plan of Ahura-Mazda and all the gods for this fortress to be built, I built it. And I completed it, good and solid, as if it were my own plan. (DSe)

In other inscriptions, he presents himself as the builder of a house (*bitu*) and a palace (*ekallu*). Darius's successors were quick to associate themselves with his work. Xerxes states that the gate—now called the Darius Gate—was conceived and erected in his father's time, as was another residence (XSd). Artaxerxes II rebuilt the Audience Hall (*apadana*) that was built by his great-great-grandfather Darius and destroyed by fire during the reign of his grandfather Artaxerxes I (A²Sa).

It is quite difficult to date the beginning of the work precisely. In one of the inscriptions, Darius writes:

Much of this evil that had been committed, I turned into good. The countries that fought each other, whose peoples killed each other, I fixed, by the grace of Ahura-Mazda, so that their peoples did not kill each other, and I restored each one to its place. And, faced with my decrees, they respected them, in such a way that the strong did not strike nor despoil the poor. (DSe 001)

It would be risky to conclude from this that the work began directly after the end of the third Elamite revolt, for Darius's phraseology is stereotypical: every good king boasts of reestablishing order and justice at the beginning of his reign.

At any rate, among the people who were pressed into service were the Ionians and the Carians, who transported Lebanese lumber from Babylon to Susa. If, as is generally thought, these Ionians and Carians represent the Asia Minor populations that were deported to Lower Babylonia and Elam after the Ionian revolt (493–492), the dating must be lowered considerably. But there already were Carians and Ionians in Babylonia before Darius! Herodotus mentions (III.140) that Darius was present at his palace in Susa at the beginning of his reign, which obviously proves nothing. For the sake of prudence, the chronological question must remain open. In any event, the work certainly lasted a very long time. We know, for example, that an interval of several years separated the laying of the foundations of Darius's palace and the foundations of the Apadana, because a comparison of the texts shows that Darius's father, Hystaspes, died in between the two events.

Even if all of the work and all of the building at Susa was not completed during the reign of Darius alone, it is nonetheless clear that the king and his counselors conceived the entire plan as a whole. The new town is organized on three terraces linked to one another. We can identify the palace (on the tell called the Apadana), the residential quarters (Royal City?), and the fortress (Acropolis). Strabo, citing an author from the time of Alexander, states that the city of Susa was 'without fortifications' (*ateikhistos* XV.3.2). The statement may seem a bit fanciful since Darius, as we have seen, boasts of restoring the city walls, building new ones, and "protecting Susa against its enemies." In reality, Darius's city walls do not, properly speaking, constitute a fortification. They are intermingled with the walls that support the various terraces. Nonetheless, the citadel itself occupied a position of strength when defense was required, as the resistance of 317 attests, when Xenophilus, who was in charge of both the citadel (*akra*) and the treasury guard (*thēsaurophylax* = **ganzabara*; Diodorus XIX.17.3; 18.1) defended against the troops of Antigonus.

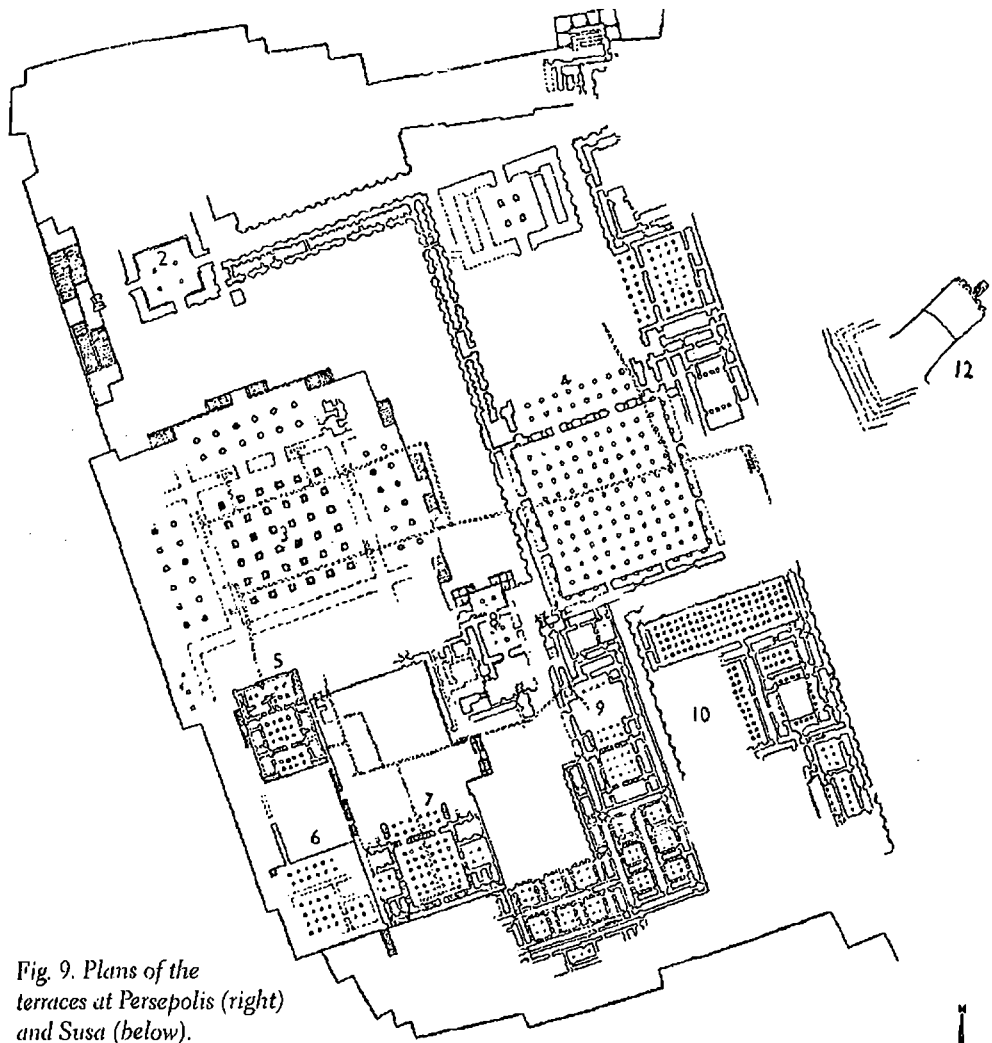

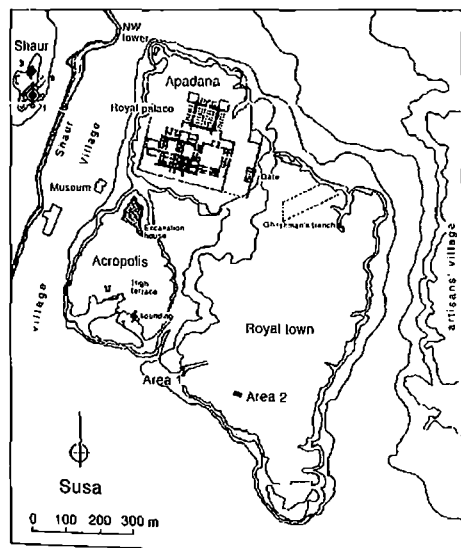

Fig. 9. Plans of the terraces at Persepolis (right) and Susa (below).

Key to plan of Persepolis (above):

1. Terrace staircase
2. Xerxes Gate
3. Apadana of Darius and Xerxes
4. Hall of One Hundred Columns
5. Tachara ('Palace') of Darius
6. Palace of Artaxerxes III
7. Hadiš ('Abode, Palace') of Xerxes
8. Tripylon
9. Harem (partly restored)
10. Treasury
11. Part of the wall (where the Elamite tablets were excavated)
12. Tomb of Artaxerxes II (or III?)

Immense labors were needed to establish an artificially level surface on which edifices could be built, 70 hectares in extent. Darius himself mentions this in referring to the construction of the palace on the Apadana tell:

The earth was dug down to bedrock; when the earth was dug [and] the gravel was sufficient, there the gravel was piled up for 40 cubits and for 20 cubits. On the gravel I built the palace. (DSf)

Excavations carried out in the town confirm the existence of these construction methods. The Royal City was supported on a 10–12-meter-high glacis of unbaked brick, 20 m thick at the base. The platform of the palaces, with an area of about 12 hectares (or the equivalent of the terrace of Persepolis), is itself protected by a retaining wall about 15 m high. It was located to the west, overlooking the Shaur, and must have accumulated a veritable breakwater of river gravel that reached 18 m at the southwest corner, since more than a million cubic meters were needed to build this one platform. Some buildings, raised on a terrace of several additional meters of earth that was brought in, had to be provided with mighty foundations. This is especially true for the Darius Gate (fig. 38, p. 260). With a foundation plan of impressive dimensions (40 × 30 m), the gate reached a height of 12–13 m and was supported by stone columns more than 1 m in diameter. There must have been strong unbaked brick foundations, placed on bedrock and protected against erosion by gravel bulwarks. The gigantic character of the undertaking is also shown by the unbaked brick causeway that crossed the 15-meter-deep ravine between the Royal City and the Apadana terrace.

The Beginnings of Persepolis

It was also Darius who undertook the initial work leading to the construction of Persepolis. Before his time, as we have seen (p. 86), all of the building had been done on the plain. Darius decided to put up a new capital there by raising a monumental terrace that would cover 125,000 sq. m upon completion. This gigantic platform abutted the nearby mountain, Kuh-e Rahmat (Mount of Mercy). Four texts have been found on the retaining wall: two in Old Persian, one in Elamite, and one in Akkadian. The Elamite text of this inscription (DPf) refers directly to the planning for which Darius was responsible:

I, Darius, the Great King, king of kings, king of countries, king on this earth, son of Hystaspes, the Achaemenid. And Darius the king says: "On this site where this fortress was built, previously no fortress had been built there. By the grace of Ahura-Mazda, this fortress, I constructed it according to the plan of Ahura-Mazda, all the gods [being] with him, [namely] that this fortress be built. And I built it, completed it, and made it beautiful and impervious, just as had been ordained of me." And Darius the king says: "I, may Ahura-Mazda protect me, all the gods [being] with him, and also this fortress, and also what was planned for this site. What the hostile man may think, may it not be recognized!"

It is not hard to verify that this statement is almost identical to one of Darius's inscriptions at Susa (DSf). In both cases, Darius boasts of building a fortress that did not previously exist and of having brought the work to completion. In both cases, the word *fortress* refers not to strictly military works but to high walls that bounded and supported the platforms on which he was going to begin to build monuments. Meanwhile, the existence of actual fortifications has been demonstrated archaeologically at Persepolis at least; they must be what Diodorus is referring to, at least approximately (XVII.61.1).

The chronology is no less problematic at Persepolis than at Susa. Several monuments can be securely dated to the reign of Darius. These include the treasury, where a portion

of a clay archive has been recovered: the first Elamite tablet is dated 492, but the sole Akkadian tablet of the group is dated to year 20 of Darius (30 December 502; PT 85). Perhaps the (first stage of the) treasury was the first building completed on the site. One of the other constructions was the palace of Darius, so called because several Darius and Xerxes inscriptions attest that the work was begun by Darius and completed by his son. This was also true of the audience court, the Apadana. In fact, foundation deposits, buried in the southeast and northeast corners, have been found there. These deposits contain a series of coins (croesids and various Greek pieces) and silver and gold plaques with the following texts:

Darius the Great King, King of Kings, King of countries, son of Hystaspes, an Achaemenian. Saith Darius the King: This is the kingdom which I hold, from the Sacians who are beyond Sogdiana, thence unto Ethiopia, from Sind, thence unto Sardis—which Ahuramazda the greatest of the gods bestowed upon me. Me may Ahuramazda protect, and my house. (DPh◇)

If we accept a nearby building, the Tripylon, as belonging to the same overall plan, we must also credit it to Darius; but the absence of any inscription means that caution must be observed. It appears as though several buildings were conceived during the reign of Darius but constructed or completed only by his successor; this is undoubtedly true of the friezes of the Apadana.

It is much more complex to determine the date of the various monuments. The only attestation of absolute chronology is furnished by the archives called the Fortification tablets, which are precisely dated to 509–494 and provide evidence that by 509 at the latest Persepolis was functioning, though it was still under construction (and it remained under construction until the end of the Achaemenid period). The foundation tablets of the Apadana, on the other hand, still stimulate varying interpretations due to the dates assigned to the coins found with them and the significance of Darius's statement found on them. If we agree that Darius wished to describe his kingdom metaphorically by enumerating the four geographic extremities that it had reached at that point, then we must agree that his statement refers to a date before the Scythian expedition (513), since that is when Sardis constituted the western frontier. Arguing from another standpoint, the way is open for a lower date, around 500, since the Apadana (audience court) of Persepolis is not identical in conception to the one at Susa. In particular, it is raised on a stepped platform, which is absent at Susa. Furthermore, because of uncertainties bearing on the rhythm of the work at Susa, it is not out of the question that the beginning of the first work carried out at Persepolis was almost contemporary with that at Susa. In any case, the chronological discrepancy between the two projects cannot have been very great. This assumes on the one hand that Darius decided to mobilize considerable labor and materials and on the other that construction on both sites was included in an overall plan for reworking the royal residences. This would have made it clear to all eyes that the advent of the king represented, pure and simple, a refounding of the kingdom and the Empire.

Work Carried Out in the Other Capitals

The promotion of Susa and Persepolis did not entail the disappearance of the earlier capitals of Pasargadae, Babylon, and Ecbatana. But we are ill informed about Darius's building activities in those locations. Whatever the chronological uncertainties that continue to burden some of the monuments at Pasargadae, Darius's participation is

highly likely. The Persepolis tablets, moreover, mention the existence of a treasury at Pasargadae and the activity of groups of workers (*kurtas̄*). We also know that the king had a new palace built at Babylon. As for Ecbatana, Darius lived there for several months in 521. An inscription has been found there whose text and medium (silver and gold plaques) are identical to the foundation plaques discovered under the Persepolis Apadana (DH = DPh). Two inscriptions of Artaxerxes II are also interesting (A²Ha and A²Hb): the second records the erection of an *apadana* on the site. Should we conclude from this that Darius had already built this kind of hypostyle hall in the Mede capital, which Artaxerxes II restored? Note as well that, according to Diodorus (II.13.6–8♦), Ctesias attributed some plans at Ecbatana to the mythic queen Semiramis:

She built in it an expensive palace and in every other way gave rather exceptional attention to the region. For since the city had no water supply and there was no spring in the vicinity, she made the whole of it well watered by bringing to it with much hardship and expense an abundance of the purest water. For at a distance from Ecbatana of about twelve stades is a mountain, which is called Orontes and is unusual for its ruggedness and enormous height. . . . She made a cutting through the base of this mountain. The tunnel was fifteen feet wide and forty feet high; and through it she brought in the river which flowed from the lake, and filled and the city with water.

It is clear that numerous works attributed to Semiramis in fact belong to the Achaemenids, such as the plans for the plain and the mountain at Behistun described in the same chapter (II.13.1–2). Since we know that Ecbatana/Hamadan had always been supplied with water via a network of *qanats* and that Polybius (X.28) refers to Achaemenid activity in this area, it is tempting to imagine that one of the Achaemenid kings, perhaps Darius, was the initiator. But this is purely hypothetical.

The Royal Tomb of Naqš-i Rostam

The efforts put into all of this are all the more remarkable because Darius was simultaneously working on a site near Persepolis, Naqš-i Rostam. It was doubtless at the beginning of his reign that Darius decided to dig a tomb in the rock some 6 km from Persepolis. He chose for this purpose a 64-m-high cliff. The floor of the tomb is 15 m above the ground, and its façade rises more than 22 m more. He removed a vast amount of rock in the process of excavating the tomb, hollowing out a vestibule from which three vaulted chambers opened, each containing three cists, all excavated from the rock. The façade proper is cross-shaped and is organized in three superposed registers (see fig. 16, p. 211). The lowest register is not sculpted. The middle register has four engaged columns, with a door opening between the two middle columns. It is a copy of the royal palace. Above, borne by representatives of thirty subjugated peoples, the king is shown on a three-step pedestal facing a fire altar, with the entire scene surmounted by divine representations. Other persons—guards (the Immortals?) and aristocrats—are shown; some, unarmed, may metaphorically represent the court's official mourning; others are armed, two of whom are identified by an inscription as Gobryas and Aspathines (DNc–d).

Darius's tomb is very clearly identified by two royal inscriptions (DNa and DNb). His successors followed his example and had other rock-cut tombs prepared nearby, each with its own special arrangements but without altering the original plan a great deal. In the absence of inscriptions, we assume that these belong to Xerxes, Artaxerxes I, and Darius II. On the other hand, beginning with Artaxerxes II, the kings preferred to have their tombs just outside Persepolis, as Diodorus says: "At the eastern side of the terrace at a dis-

tance of four plethra [120 m] is the so-called royal hill in which were the graves of the kings. This was a smooth rock hollowed out into many chambers in which were the sepulchres of the dead kings" (XVII.71.7♦). Diodorus also stresses the technological difficulties of the undertaking: "These have no other access but receive the sarcophagi of the dead which are lifted by certain mechanical hoists." This text resembles what Ctesias wrote of Darius's tomb:

Darius had a funerary monument built on the twin-peaked mountain; it was built there. The desire to visit it having seized him, the Chaldeans and his relatives prevented it; but those close to him wished to climb up there; when the priests who were hauling them to the top saw them, fear caused them to let go of the cables; the king's associates fell and were killed. Darius was deeply affected and had the haulers decapitated, all forty of them. (*Persica* §15)

It is possible, finally, that the site, like Behistun, was then enhanced by the construction of a paradise—if we accept the identification of Naqš-i Rostam with the site *Nupis-taš* ['place of writing'] known from some Persepolis tablets.

Royal Art and Imperial Towns

To the historian, the attraction of Darius's building projects (executed and completed by his successors, especially Xerxes) is not limited to architectural structures and urban planning. As the inscriptions and foundation deposits so clearly indicate, the Great King intended first and foremost to publicize the image of his sovereign, unlimited authority. For this purpose, texts and artistic representations repeatedly articulate the organization of the palace and its residences. The artists and craftsmen who worked on the construction had no artistic freedom: they were required to follow rigorously the precise specifications provided by the Great King's counselors, and obvious borrowing from the Assyro-Babylonian, Elamite, and Egyptian repertoires was fused into a new art, a royal art par excellence. Royal art reflects a program that leaves no room for improvisation. This observation also holds for the themes imposed on the seals and stamps of Persepolis and obviously for those used to exalt the royal figure on the coins. In them, the Great King is seen in the two most obvious manifestations of his power: as king and as master of the peoples of the Empire. At Susa, as at Persepolis or Naqš-i Rostam, written proclamations and artistic representations were meant to project a timeless image of the power of the Great King and of Persian power, through an exaltation of the virtues of the king and of Persian dominion over the peoples of the Empire. From this point of view, we must emphasize the uniqueness of the Behistun monument, which constitutes the sole time-bound representation of Darius's power as restorer of dynastic and imperial order, in a precisely demarcated period, against enemies who are also specifically named. Even at Behistun (relief and inscriptions), however, the—as it were—transcendental aspect of the Great King's power is significant. With emphasis on the subjugation of the conquered peoples, many reliefs (peoples bearing the throne, peoples bearing gifts, lists of countries, etc.) very clearly indicate that the new capitals were conceived as localities that gave expression both to Persian power and to the *Pax persica*. Through his virtues, acquired through the privileged protection of Ahura-Mazda, the Great King ensured the idealized unity of one world but at the same time celebrated its ethnocultural and geographic diversity. It is thus merely for convenience that in this book we shall distinguish the representations of imperial power from the representations of royal majesty (chap. 6), though it is clear that the two components overlap and support each other.

2. The King and His Peoples: Inscriptions and Iconography

The "Foundation Charters" of Susa

Numerous foundation documents have been discovered at Susa, some fragmentary and some complete. Some were meant to be buried as "foundation charters," and others were meant to be seen by visitors. By way of example, here are Darius's statements as they appear on one of the most recently discovered examples:

The palace at Susa, it is I who made it; its materials were brought from afar. . . . That which [was made] of molded bricks, people who [were] Babylonians made it themselves. And the beams which [were] cedar, them, from a mountain call[ed] Lebanon, from down there they were brought. The people who [were] Assyrians [Syrians], themselves transported them as far as Babylon, and from Babylon the Carians and Ionians transported them to Susa. And the *yaka* wood of Gandhara was brought, and also of Carmania. And gold from Sardis and Bactria was brought, that which was worked here. And the precious stones which [were] lapis lazuli and also carnelian, which were worked here, from Sogdiana were brought. And the precious stones which [were] turquoise, them, from Chorasmia, were brought [them] which were worked here. And the silver and ebony, them, from Egypt were brought. And the decorative elements with which the terrace was ornamented, them, from Ionia were brought. And the ivory which was worked here, it, from Ethiopia and India and Arachosia were brought. And the stone columns which were worked here, from a town village called Apitaruš, from down there in Elam, were brought. The craftsmen who worked the stone, they, [were] Ionians and Sardians. And the goldchasers who worked this gold, they [were] Sardians and Egyptians. And the men who made the baked bricks, they [were] Babylonians. And the men who decorated the terrace, they [were] Medes and Egyptians. Darius, king, says: "By the grace of Ahura-Mazda, at Susa, much excellent [work] was ordained, much excellent [work] was done. Me, may Ahura-Mazda protect me, me and my country as well." (DSz)

The text thus lists sixteen peoples and countries that furnished raw materials (or labor) and eight whose talents as craftsmen were used in the work. Some are found in both groups (Babylonians, Sardians, Egyptians, Ionians); some are only in the first (Syrians, Carians, and Ionians), some only in the second (Medes). Some count twice among the specialists: Sardians worked stone and wood; Egyptians, wood and the palace reliefs; Medes, gold and palace reliefs. Lastly, some were common laborers: Babylonians for foundation work; Syrians, Ionians, and Carians for transporting lumber from Lebanon to Babylon, then to Susa. But the information in the various texts does not always agree. Another Akkadian version (DSaa), even though it was buried at the same time as the Elamite version just cited (DSz), in its first section simply enumerates the materials used, without specifying their place of origin. A second section gives a list of the peoples "who brought materials for decorating the palace." No less than 23 countries, including Persia, are named.

The Country Lists

In addition to the Susa documents, we also have inscriptions and sculptures that Darius and his successors had carved on their tomb façades, their palace walls, and even on Egyptian stelae and a statue of Darius at Susa. These documents allow us to reconstruct to some extent the idealized image of the world as the masters of the Empire wished it recorded. First of all are what are usually called *empire lists*; they are included in a series of royal inscriptions, most of them dated to Darius's reign: the Behistun inscription

(DB); one of the four inscriptions placed on the south façade of the Persepolis terrace (DPe); one of the two inscriptions on the king's tomb at Naqš-i Rostam (DNa); a Susa inscription (DSe); one of the versions of the Susa foundation charter (DSaa); and finally, a Xerxes inscription (XPh). These lists enumerate the countries that were known to be subjects of the Great King, and they vary in number and order. Here are the countries listed in these six inscriptions:

DB	DPe	DSe	DNa	DSaa	XPh
Persia	Elam	Media	Media	Persia	Media
Elam	Media	Elam	Elam	Elam	Elam
Babylonia	Babylonia	Babylonia	Parthia	Media	Arachosia
Assyria	Arabia	Aria	Aria	Babylonia	Armenia
Arabia	Assyria	Bactria	Bactria	Assyria	Drangiana
Egypt	Egypt	Sogdiana	Sogdiana	Arabia	Parthia
Sealand	Armenia	Chorasmia	Chorasmia	Egypt	Aria
Sardis	Cappadocia	Drangiana	Drangiana	Sealand	Bactria
Ionia	Sardis	Arachosia	Arachosia	Sardis	Sogdiana
Media	Ionia	Sattagydia	Sattagydia	Ionia	Chorasmia
Armenia	Ionians ^a	Makran	Candhara	Armenia	Babylonia
Cappadocia	Sagartia	Gandhara	Induś	Cappadocia	Assyria
Parthia	Parthia	Induś	Saka H. ^c	Parthia	Sattagydia
Drangiana	Drangiana	Saka H.	Saka T. ^d	Drangiana	Sardis
Aria	Aria	Saka T.	Babylonia	Aria	Egypt
Chorasmia	Bactria	Babylonia	Assyria	Chorasmia	Ionians
Bactria	Sogdiana	Assyria	Arabia	Bactria	Sealand
Sogdiana	Chorasmia	Arabia	Egypt	Sogdiana	Across the sea
Gandhara	Sattagydia	Egypt	Armenia	Gandhara	Makans
Saka	Arachosia	Armenia	Cappadocia	Saka	Arabia
Sattagydia	Induś	Cappadocia	Sardis	Sattagydia	Gandhara
Arachosia	Gandhara	Sardis	Ionia	Arachosia	Induś
Makran	Saka	Ionia	Saka E. ^e	Quadia	Cappadocia
	Makran	Saka E.	Thrace		Dabae
		Thracians	Ionians P. ^f		Saka H.
		Ionians E. ^b	Libya		Saka T.
		Carians	Ethiopia		Skudra
			Makran		Akaufakans
			Carians		Libyans
					Carians
					Ethiopians
23	24	27	29	23	31

- a. What the text says exactly is: "The Ionians of the plain and the sea and the lands beyond the sea."
- b. European Ionians.
- c. *Saka haumavarga*, i.e., the haoma-drinking Saka.
- d. *Saka tigraxaudā*, i.e., the pointed-hat Saka — an expression corresponding to Herodotus's *Orthokorybantes*.
- e. European Scythians.
- f. Ionians who wear/bear the "Petasus" (a broad-brimmed, low-crowned hat).

The People Bearing Thrones

The subject peoples are represented in high-relief sculptures at many Achaemenid sites. They are found primarily as throne-bearers, numbering 30 in all on the royal tombs (Naqš-i Rostam and Persepolis) and at Persepolis itself. They are placed in three rows on each jamb of the east gate of the Tripylon, as well as on the south gate of the Hall of One Hundred Columns (28 figures). On two of the royal tombs (Darius I and Artaxerxes II

Fig. 10. Peoples bearing the throne (Persepolis: Hall of the Hundred Columns).

[?], each person is named ("Behold the Elamite," etc.), which considerably facilitates the identification of figures on the other sculptures. On the royal tombs, each person is one meter tall; elsewhere, 40 cm. Each one represents one of the subject peoples. Their arms are raised above their heads, palms up, and together they support the throne on which the king is seated.

A similar presentation of subject peoples is found in several Egyptian documents, the stelae of the Suez Canal (dug by Darius), and the statue of Darius placed at the entrance to a great gate at Susa (the Darius Gate) but carved in Egypt. They number 24 on the rectangular base of the statue (fig. 19, p. 216) and also on the stelae and are placed in two registers in both cases. They are shown in the Egyptian style, each above a crenellated oval containing each one's name in hieroglyphs. They are kneeling, hands above the head, supporting not the royal throne but the land of the Empire.

The People Bearing Gifts

Finally, we come to the most famous sculptures—the so-called tribute friezes (fig. 12). Two are found on the staircases of the Apadana (Audience Hall): on the west panel of the north staircase and on the south panel of the west staircase. They probably were created (or at any rate completed) under the reign of Xerxes. The peoples—amounting to 23—are represented as delegations. The beginning of the staircase of Artaxerxes I's palace was also decorated with delegations of peoples, in the same form, but numbering 30. The delegations are composed of varying numbers of members. The delegates are preceded by an usher in Persian garb who holds the hand of the leader of the delegation and guides him toward the king, who is enthroned at the center of the composition, in the royal audience rite. The problem of identifying the delegations remains difficult; in the absence of inscriptions, there are various solutions that are generally

based on the dress and the objects and animal gifts of the people, as well as on comparison with other depictions. But these comparisons are not always conclusive, so that numerous uncertainties remain. The chart below is one possible reconstruction of the 23 delegations shown on the face of the west panel.

	<i>People</i>	<i>Qty</i>	<i>Gifts</i>	<i>Animals</i>
1	Medes	6	Garments, vessels	Horses
2	Flamites	6	Bows, 1 dagger	Lioness, lion cubs
3	Armenians	5	Garments	
4	Aryans	5	Garments, vessels	1 camel
5	Babylonians	6	Garments, vessels	1 buffalo
6	Lydians	6	Vessel, bracelets, 2-horse chariot	
7	Arachosians	5	Vessel, skin	1 camel
8	Assyrians	7	Vessel, waterskins	2 rams
9	Cappadocians	5	Robes	1 horse
10	Egyptians	6	Garments	1 bull
11	Saka	6	Garments, bracelets	1 horse
12	Ionians	8	Garments, bales, vessel	
13	Bactrians	5	Vessel, skin	1 camel
14	Gandharans	6	Shield, pike	1 buffalo
15	Parthians	5	Vessel	1 camel
16	Sagartians	6	Garments	1 horse
17	Saka	6	Bracelets, axes, daggers	1 horse
18	Indians	6	Axes, spices(?)	1 zebra(?)
19	Scythians	4	Pikes, shields	1 horse
20	Arabs	4	Robes	1 dromedary
21	Drangians	4	Pikes, shield	1 bull
22	Lydians	3	2-horse chariot	1 ibex
23	Nubians	3	Elephant tusks	1 giraffe(?)

3. An Idealized Image of Space and Imperial Power

Space and Administration

The interpretation of these lists and sculptures continues to pose many problems that have arisen and continue to arise in the various analyses. From one list to the next, the number, position, and even sometimes the name vary noticeably. The shortest list, which is also the oldest, from Behistun, includes 23 names: the others have 24 (*DPe*), 27 (*DSe*), and 29 (*DNa*). The longest list dates to the reign of Xerxes (*XPh*). Comparison also shows that the order is not consistent. The same is true for iconographic depictions: 24 peoples on the Egyptian materials, 28 or 30 throne-bearers, 23 and 30 gift/tribute-bearers.

It is not easy to explain the presence or absence of this or that people from one list to another. We might suppose, self-evidently, that the oldest list is the shortest because the imperial conquests had not yet been completed. Thus, it is not surprising that the Hinduš is not found there, since it was conquered several years after the completion of the monument at Behistun. Nonetheless it seems dangerous to employ this sort of explanation automatically, especially since many lists are not precisely dated, and when they are, it is

frequently by circular reasoning. Variations in the imperial realm, for example, cannot explain why Persia is missing in four of the five lists or why the country of Ākaufaciya appears only in the Xerxes list (*XPh*). Similarly, in one of the Akkadian versions of the Susa Charter (*DSaa*) neither India nor Nubia is listed, while other versions attest—or rather allege—that ivory was brought from these countries. In addition, Thrace (*Skudra*), Libya, the Carians (*Karkā*), and the European Scythians are also missing. These lists thus do not appear to have been intended as a realistic picture of the state of the imperial possessions at the moment of the foundation of the palace at Susa. It seems as though the variations are particularly striking for regions in the west (Aegean coasts) and north (Central Asia). For example, the nomadic (or seminomadic) peoples of the north are simply called Saka in *DB* and *DPe*; in *DSe* and *DNa*, they are divided into two groups: Saka Haumavarga ('haoma-drinker?') and Saka Tigraxaudā ('pointed-hat-wearers'), whose name corresponds most closely to Herodotus's *Orthokorybantes* (III.192). Three groups are found in *XPh*, where the Dahae appear, who we know independently are part of the family of Scythians of Central Asia, that is, the Saka. The reduced number of names of peoples from western regions in the same Xerxes inscription does not appear explicable by anything other than territorial advances and retreats.

Fig. 11. Lower register of throne-bearing peoples on the royal tombs.

The same goes for the reliefs, where the problem of identification becomes extremely complicated. The criterion of discrimination by clothing is not always decisive. The composition of certain reliefs seems to depend more on spatial constraints and aesthetic principles than on territorial or administrative realities. The same is true for the number of delegates on the friezes of tribute/gift-bearers. Careful examination shows that the number cannot be taken as a criterion, for example, of the relative importance ascribed to each of the peoples depicted. The number of delegates, in fact, is smaller when the animal brought by the subjects is bigger. The largest delegations (no. 1 with 9 people; no. 12 with 8 people) do not bring an animal as a gift, but the delegations (4, 7, 13, 21) accompanied by a "Bactrian" camel have only 4 members, and the number is reduced to 3 for the Arabs, who bring a dromedary, and for the Nubians, who are accompanied by an unidentified animal (giraffe? okapi?). The case of the Medes makes this analysis clear: on the east staircase of the Apadana, 9 Medes are shown, in contrast with the 6 appearing on the north staircase, quite simply because in the latter case they are accompanied by a stallion, which is absent from the east relief. On the Egyptian stelas, neither the Yaunas nor the Gandharans, who are found in all the lists, are depicted (there was no room to show all the peoples). This is also true for the throne-bearers (fig. 11). Two of them (nos. 29 and 30: *Karkā* and *Maciya*) had to be sculpted outside the field marked out by the legs of the royal throne: one to the right (no. 30) and the other to the left (no. 29).

It must thus be recognized that neither the lists nor the representations constitute administrative catalogs yielding a realistic image of the imperial realm. It was not administrative districts that the Great Kings wanted to represent. The word used in the inscriptions is *dahyu* 'people'. The kings did not intend to give a list that was either complete or exact. The inscribed lists are nothing but a selection of subject countries. Darius and his successors are neither archivists nor historians. What they intend to leave to posterity is not administrative data. The inscriptions accompanying the reliefs show instead that what they wished to transmit to their contemporaries was a politico-ideological message.

Subjugation and Collaboration

Given the perspective that the reliefs and inscriptions are concerned with political and ideological issues, the different versions of the Susa inscriptions (*DSz* [Elam.]; *DSf* [OPers., Bab., Elam.]) provide considerable clarification. More than a statistical inventory of the economic resources of the Empire, they are amenable to what might be called "images of the world," by means of which the Great Kings, especially Darius, intended to impose the idea of the unbounded nature of their authority over territories and populations. Here, for example, is how Darius summarizes the work in one of the Akkadian inscriptions from Susa (*DSaa*):

'These are the materials that were used for this palace. . . . These are the countries that provided the materials for the decoration of this palace. . . . Darius the king says: "By the grace of Ahura-Mazda, the materials of this palace were brought from afar and I made the arrangements."

In this sort of text, it is the detail "from afar" that is the key to the logic of the discourse. The royal inscriptions from Susa had the principal function of exalting the mobilization into the king's service of the production and manpower of an Empire that recognized and defined itself through work explicitly called communal and integrative.

Fig. 12. Some gift-bearing peoples:
Medes, Elamites, Parthians,
Aryans, Bactrians, Sagartians.

These documents eloquently attest to the royal desire to depict every country and every people of the Empire united in harmonious cooperation organized by and surrounding the king. In the enumeration, the far corners of the Empire are recognized: Sardis, Sogdiana, the Indus, and Nubia. Every region is represented: the center (Elam, Babylonia), the far west (Sardis, Ionians), the north (Bactria, Sogdiana, Chorasmia), the east (Carmania, Gandhara, Indus), the west-southwest (Syria, Egypt, Nubia); and each of them contributed its building-stone to the edifice, whose construction was decreed by Darius and realized with the aid of Ahura-Mazda. The same sort of statement is found at Persepolis: "These are the countries that built this, which are gathered here" (DPg). Despite the profoundly ideological character of these statements, a realistic component can also be recognized in them. It is in fact beyond doubt that laborers from many countries were gathered at Susa, as they had been at Persepolis. It took thousands of men several years to complete such gigantic projects.

A related idea may be found in the depictions of peoples as throne-bearers, bearers of the soil of the Empire, or gift-bearers. But in these cases the accent is placed more on political subjugation and imposition of tribute than on collaboration. At Naq̄-i Rostam, Darius addresses those who contemplate the relief carved on his tomb thus:

If now thou shalt think that "How many are the countries which King Darius held?" look at the sculptures (of those) who bear the throne, then shalt thou know, then shall it become known to thee: the spear of a Persian man has gone forth far; then shall it become known to thee: a Persian man has delivered battle far indeed from Persia. (DNa §4♦)

The relation between military conquest and imperial dominion is just as explicit in the message carved on the pleats of the statue of Darius at Susa: "Behold the stone statue that Darius ordered made in Egypt so that whoever sees it in the future may know that the Persian holds Egypt" (DSab). This is also the sense of the statements that open the country lists: "These are the countries which came unto me; by the favor of Ahuramazda I was king of them." Darius ends with these words: "These are the countries which came unto me; by the favor of Ahuramazda they were my subjects (*bandaka*); They bore tribute (*bāji*) to me; what was said unto them by me either by night or by day, that was done" (DB §7♦). The formula used by Xerxes (XPh♦) is nearly identical: "By the favor of Ahuramazda these are the countries of which I was king outside of Persia; I ruled over them; they bore tribute to me; what was said to them by me, that they did; my law (*dāta*)—that held them firm."

The Empire and the Known World: Representations and Realities

We have seen that all of the royal statements are organized around the phrase "from afar": the Persians conquered "from afar," and the peoples who worked on Susa came "from afar." This phrase all by itself expresses the immensity of the space conquered and controlled by the Great King and the Persians. It is also present in the royal titulature. Darius I appears as "King in this great earth far and wide" (DNa♦). But here it is but one element among several: "king of the multitude, only master of the multitude, I am Darius the Great King, King of Kings, King of countries containing all kinds of men" (DNa♦); he is also "King of many countries" (DPe♦). Here is how this same Darius defined his territorial authority on the foundation tablets of the Apadana at Persepolis: "This is the kingdom which I hold, from the Scythians [Saka] who are beyond Sogdiana, thence unto Ethiopia [Cush]; from Sind, thence unto Sardis" (DPh♦).

This sort of presentation is found in several Classical texts. Strabo considers Cyra on the Iaxartes (Syr Darya) to be the farthest point of Persian dominion in Central Asia (XI.11.4: *horion tēs Persón arkhēs*). For Herodotus, Colchis plays the same role in the direction of the Caucasus (III.97). And, among the frontier countries of the Achaemenid world (the *eskhatiai*) where deportees were sent, the Greek authors regularly list Bactria, India, Armenia, and the Persian Gulf. According to the author of the *De Mundo* (398a 25♦), the Asian Empire was “bounded on the west by the Hellespont and on the east by the Indus.” From a more Aegeo-centric point of view, Xenophon describes Cyrus’s Empire in this way: “Its borders were to the east the Red Sea [Persian Gulf], to the north the Pontus Euxinus, to the west Cyprus and Egypt, and to the south Ethiopia” (Cyr. VIII.8.1 = VIII.6.21). Elsewhere, Xenophon attributes the following statement to Cyrus the Younger: “Well, gentlemen, my father’s realm extends toward the south to a region where men cannot dwell by reason of the heat, and to the north to a region where they cannot dwell by reason of the cold” (*Anab.* I.7.6♦). This is an explanation often given by Xenophon; in another work, he repeats it to convince his fellow citizens of the excellence of the “central” position of Athens, because of its equidistance between the land of too-hot and the land of too-cold (*Reverus* I.6–8). Labeling the far reaches of the earth by temperature extremes is not exclusively Greek, considering that (as Darius writes) he is also “king over this vast land, in which there are many countries: Persia, Media, and the other countries with other languages, mountains, and plains, from this side of the Bitter River and from the other side of the Bitter River, from this side of the parched land and from the other side of the parched land” (*DPg*). These titulatures stress the immensity of the imperial space and also the ethnic, cultural, and linguistic diversity of the peoples subject to the “king of the countries.” At any rate, does not Xenophon stress that Cyrus “ruled over these nations even though they did not speak the same language as he, nor one nation the same as another” (Cyr. I.1.5♦)? Did not Darius himself, at Behistun, order that his declaration be publicized in the languages of his peoples (*DB* §70)?

All of these texts are also interesting for the closed representation they give of the Achaemenid Empire, which was bounded by “frontiers.” At first sight, this concept seems to contradict the frequently advanced hypothesis that the Great Kings justified their conquests by the affirmation of universal and infinite dominion. In reality, what Darius calls the land (*būmi*)—what the Greeks call *arkhē* [‘territorial’] dominion’ and what we ourselves call the Empire—is notionally merged with the frontiers of the known world: the Empire represents the totality of lands and peoples. This is precisely the reality expressed by Dino, who writes: “The Persian kings had water fetched from the Nile and the Danube, which they laid up in their treasuries as a sort of testimony of the greatness of their power (*arkhē*) and universal empire” (*to kyrieuein hapantōn*; Plutarch, *Alex.* 36.4♦). This concept does not imply that the Great Kings were unaware of the countries located outside of the jurisdiction of their territorial dominion. The attempted circumnavigation of Africa attributed to the Persian Sataspes by Herodotus suggests that they were fully aware of them (IV.43). But here we are in the realm of appearances, whose logic requires that the unconquered countries be considered not to belong to the inhabited world (*oikoumenē*); they are relegated to nonexistence, beyond the “parched lands” and the “Bitter River.”

Recognition of the homology between the “frontiers” of the Empire and the edges of the known world allows us to understand that the country lists are not totally devoid of

rationality. While the order of enumeration varies from one list to the next, nonetheless the countries are clearly named according to geographical groupings. Taking the Behistun inscription as an example, we can distinguish the following subgroups:

- A. Center of the Empire (Persia, Elam)
- B. South–Southeast Axis (Babylonia, Assyria, Arabia, Egypt)
- C. West–East Axis (Those of the Sea, Sardis, Ionia, Media, Armenia, Cappadocia)
- D. Center–East Axis (Parthia, Drangiana, Aria, Chorasmia, Bactria, Sogdiana)
- E. Southeast–West Axis (Gandhara, Scythia, Sattagdyia, Arachosia, Makran)

A closed world, the world of the royal inscriptions was a circular world. To the north, the Saka and Scythian peoples constituted a semicircle from east to west; similarly, to the south, the Libya–Ethiopia–Makran–Karkā [deported Carians at the source of the Persian Gulf] group (attested in *DNa*) form another semicircle. These political representations of the imperial realm are perhaps also integrated into Iranian religious concepts. In *Yasht* 10 of the *Avesta* (Hymn to Mithra), the world watched over by Mithra is bordered by a river to the west and a river to the east. There is also an allusion to the River Ranha, which borders the world. The Iranian world can be diagrammed as a Greek cross in a circle, which is traced by the Ranha.

Center and Periphery: "Aryan of Aryan Stock"

At the same time, this world was organized around a center. In most of the inscriptions, it includes Persia, Media, and Elam (not always listed in the same order), that is, the countries where the sedentary centers of Achaemenid power were located: Pasargadae, Persepolis, Ecbatana, and Susa. These regions are the origins of the axes that radiate in all directions, like the royal roads that link the center to the periphery, as Xenophon puts it: "The tribes that [Cyrus] brought into subjection to himself were so many that it is a difficult matter even to travel to them all, in whatever direction one begins one's journey from the palace (*basileia*), whether toward the east or west, toward the north or the south" (*Cyr.* I.1.15♦).

Even within this group, the subgroup Persia–Media, so often named by the Great Kings, occupies a special place. Darius refers to "this vast land, in which there are many countries—Persia, Media, and the other countries with other languages" (*DPg*). This statement indicates that the pair Persia–Media is bound not only by a common history but also by the closeness of their ethnocultural and linguistic links. This is exactly what the use of the word "Aryan" (*arya*) means in several royal inscriptions and three specific contexts: Darius and Xerxes are presented as 'Aryan[s] of Aryan stock' (*arya arya chiça*; *DNa*, *DSe*, *XPh*); at Behistun, Darius issues an order "to copy onto tablet and parchment the text that already exists in Aryan" (*DB* §70); finally, the Elamite version of Behistun describes Ahura-Mazda twice as 'the god of the Aryans' (*nap harriyanam*; *DB* Elam. §§62–63). Thus the word *arya* refers to a cultural, religious, and linguistic entity.

The word *arya* has a long history that goes back to the origins of what we call the Indo-Iranian peoples, whose common origins are well evidenced by the often-underscored similarities between the *Avesta* and the *Rig-Veda*. From this common trunk (reconstructed solely on linguistic grounds) the so-called Iranian peoples descended. At any rate, regarding the Medes, Herodotus recalls that they "were once universally known as Arians" (*Ariaoi*; VII.62♦). The hellenistic geographers themselves defined a geographic entity they called *Ariana*, which according to Strabo included the peoples of

the Iranian Plateau, "further extended to a part of Persia and of Media" (XV.2.8♦). Strabo also describes its unity according to a linguistic measure: "For these speak approximately the same language, with but slight variations (*homoglōttoi para mikron*)."¹ This statement highlights both the linguistic unity and the diversity of dialects, which are well known from philological investigations.

What is the meaning of this usage by Darius and Xerxes? We know that in the Sassanian period King Shapur bore the title *Shahan Shah Eran*, transposed into Greek in the form *Basileus Basileōn Arianōn*, that is, 'king of the kings of the Aryans [Iranians]'. In the Achaemenid period, however, there is no trace of an Iranian political unity symbolized by the word *Iran*. Of course, the Iranian countries always occupied a special position in the Empire. It was they, for example, that constituted the vanguard of the great Achaemenid armies. Quintus Curtius described the situation in 330: these countries represent a region "which in arms and men, as well as in extent of territory is second to none among those nations; it occupies a third part of Asia, and the number of its men of military age equalled the armies which Darius [III] had lost" (V.10.3♦). Referring in all probability to the Iranian peoples, he adds: "In these nations, the majesty of their kings is extraordinary; in response to his mere name the barbarians assemble, and veneration for his former fortune attends him even in adversity" (§2♦). These very general statements do not imply that from Bactria to Persia the populations believed themselves to belong to a single political entity. But the structure of some country lists under Darius (DNa; DSe), and more so under Xerxes (XPh), separates the Iranian countries (some of them, at least) and places Media at the top.

The Great Kings use the word *arya* to define the power of a superior population. Implicitly, they are characterized by opposition to non-Iranians. Indeed, the word 'non-Iranian' itself (*anairya*)—attested in the *Avesta* and in Herodotus transcribed as *enarees* (I.105; IV.67)—does not appear in the Achaemenid corpus. Nevertheless, Darius sets the Persians and the Medes in opposition to "the other countries with other languages" (DPg). Thus there seems to be, on Darius's part, a desire to archaize, especially if we recognize that the term *arya* originally referred to ancestral nobility.

Center and Periphery: Persia and the Empire

Darius certainly did not intend either to exalt an Iranian political unit [Iran] or to affirm the existence of a Persian-Mede joint sovereignty. When Persia is mentioned in the country lists, it is always at the top; when it is not, its absence expresses its superiority to all other countries. It is perfectly clear, in fact, that the true center of the Empire is the country of Persia alone. This was perfectly understood by Herodotus when he wrote (I.134♦):

After their own nation they hold their nearest neighbors most in honour, then the nearest but one—and so on, their respect decreasing as the distance grows, and the most remote being the most despised. Themselves they consider in every way superior to everyone else in the world, and allow other nations a share of good qualities decreasing according to distance, the furthest off being in their view the worst.

We cannot imagine a better definition of peripheral peoples! He obviously considers the exemption from tribute granted to Persia in the same general context (III.97). The sage Calanus was also able to give a particularly vivid representation of the decisive importance of the center prior to Alexander (Plutarch, *Alex.* 65.6–7).

In the inscriptions already cited, the complete titulature is as follows:

Darius the king, one king of many, one lord of many. I am Darius the Great King, King of Kings, King of countries containing all kinds of men, King in this great earth far and wide, son of Hystaspes, an Achaemenian, a Persian, son of a Persian, an Aryan having Aryan lineage. (DNa◇)

The pedigree of Darius is thus defined by family (Hystaspes), royal stock (Achaemenids), ethnic group (Persian), and "ethnic" stock (*arya*). We get the impression that here the word *arya* refers narrowly to the Persians or even the royal family. Under this hypothesis, the use of this archaizing vocabulary (*arya*) by Darius would also contribute to founding the irrevocable dynastic rights of his lineage. At any rate, in DB §70 the word *arya* 'Aryan language' does appear to be used in a restricted sense, 'Persian language'.

Whatever the case on this point, the inscriptions of Darius and his successors attest to the privileged place of Persia and the Persians in the royal self-perception. At Naqš-i Rostam, the list of subjugated countries is introduced as follows: "By the favor of Ahuramazda these are the countries which I seized outside of Persia" (DNa §3◇). A very similar but even more explicit formula is found in the Persian version of the trilingual panel of the southern retaining wall of the Persepolis terrace: "By the favor of Ahuramazda, these are the countries which I got into my possession along with this Persian folk" (DPe◇). This individually Persian character of the conquest is clearly highlighted in numerous royal statements, as we have already seen: "I am a Persian; from Persia I seized Egypt. . . ships went from Egypt through this canal to Persia . . ." (DZc◇); "the Persian man/warrior (*martiya*) conquered Egypt" (DSab); "the spear of a Persian man has gone forth far . . . a Persian man has delivered battle far indeed from Persia" (DNa◇); and so on.

In several inscriptions, Darius favors the "Persian country," and he invokes the protection of Ahura-Mazda:

Saith Darius the King: "This country (*dahyu*) Persia which Ahuramazda bestowed upon me, good, possessed of good horses, possessed of good men (*martiya*)—by the favor of Ahuramazda and of me, Darius the King does not feel fear of (any) other." Saith Darius the King: May Ahuramazda bear me aid, with the gods of the royal house; and may Ahuramazda protect this country from a (hostile) army, from famine, from the Lie (*drauga*)! Upon this country may there not come an army, nor famine, nor the Lie; this I pray as a boon from Ahuramazda together with the gods of the royal house. This boon may Ahuramazda together with the gods of the royal house give to me!" (DPd◇)

Another inscription on the trilingual panel, still in Old Persian, contains the following statement:

Saith Darius the King: If thus thou shalt think, "May I not feel fear of (any) other," protect this Persian people; if the Persian people shall be protected, thereafter for the longest while happiness unbroken—this will by Ahura come down upon this royalhouse. (*viθ*; DPe◇)

And, at Naqš-i Rostam, this formula is found:

Me may Ahura-Mazda protect from harm, and my royal house, and this land. (DNa §5◇)

All of these proclamations appear to express the establishment of a special relationship between Darius and his country (*dahyu*), that is, Persia *sensu stricto*, defined first of all by its military force ("good horses, good warriors"). It is his country (*dahyu*) and his house (*viθ*) that he calls on the Persian gods to protect. The privileged place of the Per-

sians around the king is also clearly evident in Herodotus's description of Xerxes' royal procession: only Persians precede, surround, and follow the royal chariot; "a host of troops of all nationalities indiscriminately mixed" walked in front, but "a gap was left in the marching column to keep these troops from contact with the king" (VII, 40); (VII.40 \diamond); likewise at the end of the procession: "A squadron of ten thousand Persian horse, after which there was a gap of two furlongs [ca. 400 m] in the column before the remainder of the army, a mass of troops with no particular distinction, brought up the rear" (VII.41 \diamond).

Meanwhile, the royal descriptions are not always in strict agreement. Thus Persia is listed at Behistun and in a Susa inscription (*DSm*) among the countries that had submitted to Darius. In one of the versions of the foundation charter (*DSaa*), it is also mentioned among the peoples/countries "who brought [me] the materials for decorating this palace." On the other hand, in the other versions, the Persians are not listed among the peoples who furnished materials or work details (*DSz*, *DSf*). They are also absent from the delegations coming to bring gifts to the Great King, but they are represented among the throne-bearers; this indicates that, even though the Persians are special, they are still subjects of the king. For the rest of the inscriptions, such as *DSaa*, this type of enumeration is intended above all to record the cooperation of all of the peoples in a common effort. The very title "king in [of] Persia" appears alone twice: in the Behistun inscription ("I am Darius the Great King, King of Kings, King in Persia, King of countries" [*DB* §1 \diamond]) and in another, minor inscription from the same site (*DBa*).

How can we resolve what seems at first sight to be a contradiction within the royal discourse? Should we propose a distinction between the Empire (*būmi*) and the kingdom (*xšāça*), the latter referring exclusively to Persia? Or should we instead understand the terminological distinction diachronically, with the emphasis on Persia illustrating the conflicting relationships between the king and the Persian aristocracy at the moment of Intaphernes' revolt? Or rather, more simply, can we see the different expressions as a major contradiction? When Darius proclaims himself "Persian, son of a Persian," it is simply because the Persians and his army continue to play a central role in the Empire. It is also because, as Herodotus puts it (I.132), "the king himself is included among the Persians." But, if Darius does not insist on his title "king in Persia," it is because he intends above all to emphasize the universality of his authority, from which Persia cannot be excluded: Persia also is under the jurisdiction of the territorial dominion of the "king of the countries." In the same way, when Herodotus states that "only the country where the Persians dwell enjoys immunity" (*ateleia*; III.97), he is referring only to tribute, meaning primarily politico-ideological tribute (*dasmos*), since recent research has shown that, despite its unquestionable political privileges, Persia was never exempt from all fiscal dues (chap. 11/10).

4. Images and Realities: The King among His Peoples

Peoples and Gifts: An Imperial Festival at Persepolis?

It appears clear that neither the country lists nor the depictions of peoples are intended to give a realistic picture of the administration or the geography of the Empire. Instead, the lists and depictions are primarily the vehicles of the very idea of royal and imperial power. The question remains whether the images also represent ceremonies that were regularly carried out at Persepolis. A positive answer is often given on the basis

of the frizes, on which delegations bring to the king objects and animals that are probably typical of their produce. Based on comparisons with medieval Iranian texts (al-Biruni in particular) and Indian texts, there have been frequent attempts to reconstruct, sometimes in considerable detail, the various stages of an annual imperial festival that was observed at the New Year (March).

There can be no doubt about the existence of festivals and ceremonies at Persepolis. In a broad outline of the work of Ctesias, Photius writes: "Having returned to Persepolis (*eis Persas*), Darius offered sacrifices, then died after thirty days of illness" (§19). Despite the allusive character of the passage, it is tempting to relate it to Xenophon's long description of a great parade organized by Cyrus (Cyr. VIII.3-4): "Next we shall describe how Cyrus for the first time drove forth in state from his palace" (3.1♦). Descriptions follow of the king's retinue, the protocol that guided it, the king's and the gods' chariots, sacrifices, games, the banquet, and finally the king's gifts. Then Xenophon describes the progress of the king's caravan toward Persia (VIII.5.1-16): "And when, as he continued his journey, he came to the boundaries of Persia, he left the main body of his army there, while he went on with his friends to the capital; and he took along animals enough for all the Persians to sacrifice and make a feast" (VIII.5.21♦). Obviously, this does not describe a unique festival, since, speaking of the death of "Cyrus," Xenophon states that this was the seventh time the king went thus to Persia: "Cyrus performed the customary sacrifice (*ta nomizomena hiera*) and led the Persians in their national dance (*kata ta patria*) and distributed presents among them all, as had been his custom" (VIII.7.1♦).

Quite a few of the details given by Xenophon are found in other Classical authors. Herodotus (VII.40-41) describes the order of march for the royal procession of Xerxes that left Sardis in 480; Quintus Curtius (III.3.8-25) presents the order of the procession of Darius III leaving Babylon in 333. Along with some differences, common elements are found in Xenophon, Herodotus, and Quintus Curtius, which is all the more interesting, given that they clearly derive from different sources. The procession sets out at sunrise (Xenophon, Quintus Curtius; cf. Herodotus VII.54). Cyrus was in his chariot, his charioteer nearby; likewise Darius III was placed in a chariot "in which he rode outstanding (*eminens*) among the rest" (III.3.15♦); Xerxes was "riding in a chariot (*harma*) drawn by Nisaeen horses, his charioteer, Patiramphes, son of Otanes the Persian, standing by his side" (VII.40♦); the word used by Herodotus (*harma*) proves that it was a war chariot, not a four-wheel chariot (*harmamaxe*), two vehicles that the author explicitly distinguishes (VII.41). The procession was accompanied by guards and soldiers:

- Cyrus: 4,000 lance-bearers (*doryphoroi*) before the chariot; 2,000 more on each side of the royal chariot; then (after the 200 royal horses), 10,000 cavalry (arranged 100 square), then two more groups of 10,000 cavalry; finally allied troops and chariots (Cyr. VIII.3.15-18);
- Xerxes: 1,000 Persian cavalry, 1,000 Persian pike-bearers, 10 Nisaeen horses before the chariots of the god and the king; and afterward, other Persian troops: 1,000 pike-bearers, 1,000 cavalry, 10,000 lancers (with gold and silver sashes) and 10,000 Persian cavalry;
- Darius III: the 10,000 Immortals and the *doryphoroi* precede the royal chariot; 10,000 lancers follow the royal chariot.

The king is also accompanied by his associates: near Cyrus are his relatives (*syggenais*); before Darius III's chariot and after the Immortals walk his relatives (*cognati*); to the right and left of his chariot are placed 'the most noble of those close to him' (*nobi-*

lissimi propinquorum). Finally, each of the processions includes divine chariots: one for Zeus, one for the Sun, and a third one followed by a fire altar ("Cyrus"); the sacred chariot of Zeus (*Xerxes*); fire altars and "a chariot dedicated to Jupiter" (Darius III). It thus seems clear that all three sources transmit credible information on the arrangement of the royal procession, whether during a regular ceremony held in Persia or a relocation of the royal court under other circumstances. In fact, many elements of the Classical descriptions are found on some Persepolis reliefs: guards, royal horses, royal chariot, bearers of royal appurtenances, processions of nobles, and even lines of servants bringing food and drink and vessels for the royal table.

Despite striking, undeniable convergences of the evidence between the Persepolis reliefs and the accounts of Classical authors, numerous objections have been offered against the hypothesis that a New Year festival was celebrated at Persepolis. First of all, the hypothesis is based on the assumption that Persepolis was "a ritual city," dedicated solely to the political exaltation of the power of the Great King. To be sure, this aspect should not be underrated; quite the opposite. But the discovery of the Treasury and Fortification tablets has proved indubitably that Persepolis was also a permanent economic center and the seat of administrative bureaus. We will also find that no contemporary text makes any mention of a New Year festival; but, however legitimate this observation, it must not be allowed to rule out the possibility that one existed, considering how sparse and fragmentary the Achaemenid documentation is. It is obviously more noteworthy that, according to the Classical authors, it was in autumn (and not in spring) that the court resided in Persia. Moreover, at no time does Xenophon mention the arrival of delegations of subject peoples. Instead, he stresses the king's distribution of gifts. The festival he describes obviously takes place in a purely Persian context, where the religious element appears to predominate. As we know from the author of *De Mundo* (398a), the existence of 'receivers of gifts' (*dōrōn apodektēres*) at the court of the Great King probably did not require a ceremony, since the king could receive gifts on many other occasions. The perennial declaration of Darius (and his successors) that "these are the countries that brought me *bāji*" cannot be used to prove anything more than what it says. We note first that the Persian word *bāji* connotes 'the king's share' more than tribute per se. Second, the frequent tabular comparisons set up between the friezes of tributaries/givers and the discussion of tribute by Herodotus are in fact doomed to failure. Herodotus's list of tribute districts actually represents a different logic from the logic governing the composition of the lists and reliefs, even when in the tribute disposition of Darius the *dahyulethnos* retains its central position. This is why the depictions are habitually described as Gift-Bearers rather than Tribute-Bearers (anyway, according to all indications, the gifts were paid in money). However, the terminological adjustment obviously does not resolve the problem.

The principal objection to positing an imperial festival is methodological in nature. Iconological and iconographic analysis has shown that, overall, inscriptions and reliefs are intended *prima facie* to impose and transmit the image of a universal, intangible power. Achaemenid rhetoric is nourished less by administrative realities than by ideological assumptions, which have their own logic. In other words, Persepolitan art is not a simple, quasi-photographic reflection of reality. Though it does capture reality, it does so in order to transform it and make it sublime; it relates less to a scenic scenario than to an ideological discourse on royalty and imperial might organized around themes

particularly evocative of the power of the Great King: the king in majesty (audience reliefs, etc.), armed forces (rows of Persian and Elamite guards), the cooperation of the aristocracy (rows of nobles in Persian or Mede garb), and imperial dominion in turn symbolized by the gifts from various populations and by the richness of the royal table. Under these conditions, it is perhaps risky to reconstruct a dynamic reality (observation of a periodic imperial festival around the king) on the basis of depictions that are static and immutable.

We must recognize that the objection is weighty. At the same time, we must carefully observe that even if the royal artists, working according to an imposed model, were not charged with describing a festival and its appurtenances realistically, this does not *ipso facto* imply that the hypothesis of an imperial ceremony must be abandoned. In order to take into account all of the documented facts, we would do well to return to the Classical sources. Indeed, none of them indisputably corroborates the hypothesis of an imperial festival periodically celebrated at Persepolis (whether or not it took place at the time of the New Year), but some of them describe the bestowing of gifts on the Great King, during the relocations of the court. Let us then set forth first of all the details of this Achaemenid custom in which the Greek authors show great interest.

The Nomadic King

Here is how Xenophon explains the origins of the court migrations:

Cyrus himself made his home in the centre of his domain, and in the winter season he spent seven months in Babylon, for there the climate is warm; in the spring he spent three months in Susa, and in the height of summer two months in Ecbatana. By so doing, they say, he enjoyed the warmth and coolness of perpetual spring-time. (Cyr. VIII.6.22♦)

The same explanation is found in Strabo (XV.I.16) and Athenaeus (XII.513f♦), who sees in this custom an illustration of the luxury surrounding the life of the Great King:

The first men in history to become notorious for luxurious (*tryphūi*) living were the Persians, whose kings wintered in Susa and summered in Ecbatana. . . . In Persepolis they spent the autumn, and in Babylon the remaining portion of the year. So also the Parthian kings live in springtime at Rhagae [Media], but they winter at Babylon, (and pass) the rest of the year (in Hecatompylus [Parthia]).

Aelian sees in this custom evidence of the wisdom of the Great Kings, whose migrations he compares to the annual migrations of fish and birds (*Anim.* III.13; X.16). Conversely, in his very polemical work *Agesilaus* (9.5♦), Xenophon attempts to illustrate once again his thesis of the "moral decadence" of the Great King: "shunning heat and shunning cold through weakness of character, imitating the life, not of brave men, but of the weakest of the brutes." Whatever the Greek interpretations, there is no doubt of the existence of the institution. Furthermore, in a passage on the cuisine of the Great Kings, Polyaeus states that their menus varied with their places of residence (IV.3.32). Aelian also records many anecdotes deriving from the seasonal relocations of the court.

The climatic explanations offered are certainly not irrelevant to this sort of nomadism. We know in fact that Susiana was stifling during the hot season. Strabo, referring to Polyclitus, states, for example: "When the sun is hottest, at noon, the lizards and the snakes could not cross the streets in the city quickly enough to prevent their being burnt to death in the middle of the streets," or again (quoting Aristobulus) "Barley spread out in the sun bounces like parched barley in ovens" (XV.3.10♦). A report from the time of

the Diadochi also shows how oppressive the heat was in June or July: "They walked into a furnace because of the intensity of the heat; many men died and the army fell into despair" (Diodorus XIX.28.1–2; 39.1). Several Hellenistic texts in particular describe the contrast between the Susiana plain and the Iranian Plateau in Fārs. These documents are even more interesting because they are composed from the point of view of a traveler going from Susa to Persepolis (Diodorus XVII.67.1–13; XIX.21.2–3).

There is no reason to doubt that the Great King and his court were looking for more hospitable locations at the height of summer; parallels could be multiplied throughout the Near East. However, there were also historical reasons. With reference to an identical custom of the Parthian kings during his time, Strabo writes: "The Parthian kings are accustomed to spend the winter there because of the salubrity of the air, but the summer at Ecbatana and in Hyrcania because of the prevalence of their ancient renown" (XVI.1.16♦). Likewise, the Achaemenids would not have been able to establish residences at Susa or Babylon without returning to their roots in Media or Persia — especially Persia, where two towns, Pasargadae and Persepolis, remained the ideological apexes of their power.

Aside from these seasonal migrations, the king and court relocated under quite a few other circumstances. This happened especially when the king called up the royal army and led it himself. These armies, in fact, bore only a very slight resemblance to present-day armies. On these occasions, the king was accompanied by his court, family, courtiers, household staff, and even his palace (transformed into tents). The texts bearing on these wartime migrations allow us to reconstruct the pomp and circumstance surrounding the moves and to understand their politico-ideological aspects more clearly.

An Itinerant State

Many texts show that, when the king periodically changed locations, thousands of people also had to migrate. Every member of the royal house, in fact, took part in the trips and moves. Witness the lineup accompanying Darius III when he left Babylon. The end of the procession went like this:

Next, at an interval of a single stade, one chariot carried Sisigambis, Darius' mother, and in another was his wife. A throng of women of the queens' household rode on horses. Then followed fifteen of what they call *harmamaxae*; in these were the king's children and their governesses, and a herd of eunuchs, who are not at all despised by those peoples. Next rode the 365 concubines of the king, these also regally dressed and adorned. . . . Next to this division rode the wives of his relatives and friends, and troops of sutlers and batmen. (Quintus Curtius III.3.22–25)♦

In fact, "not only the ladies of the royal house but also those of the King's Relatives and Friends, borne on gilded chariots, had accompanied the army according to an ancestral custom of the Persians" (Diodorus XVII.35.3♦). We know that Xerxes brought along some of his illegitimate children on the march against Greece (Herodotus VIII.103–4). Relations and Friends received places of honor in Darius III's procession (Quintus Curtius III.3.14, 21).

Many other elements demonstrate that the king's relocations signified that the State itself was on the march. The king brought with him the insignia of power, namely his royal robe (*kandys*), bow, and shield. He was also accompanied by images of the gods. Xerxes' procession, in 480, included "the holy chariot of Zeus drawn by eight white

horses, with a charioteer on foot behind them holding the reins—for no mortal man may mount into that chariot's seat" (Herodotus VII.40♦). This is the official order of march of the royal procession of Darius III:

In front on silver altars was carried the fire, which they called sacred and eternal. Next came the Magi, chanting their traditional hymn. These were followed by three hundred and sixty-five young men clad in purple robes, equal in number to the days of a whole year; for the Persians also divided the year into that number of days. After that, white horses drew the chariot consecrated to Jupiter; these were followed by a horse of extraordinary size, which they called the steed of the Sun. (Quintus Curtius III.3.9–11♦)

When the procession halted, the royal tent was erected. According to Xenophon, "At the very beginning Cyrus made this rule, that his tent should be pitched facing the east; and then he determined, first, how far from the royal pavilion the spearmen of his guard should have their tent. . . . He himself first took up his position in the middle of the camp in the belief that this situation was the most secure. Then came his most trusty followers, just as he was accustomed to have them about him at home, and next to them in a circle he had his horsemen and charioteers" (Cyr. VIII.5.3; 8♦). In this way, the king's tent was at the very heart—the word covering simultaneously both topographic and hierarchical realities. Xenophon also states that each officer had a banner over his tent (VIII.5.13). The royal tent was easily recognizable: "When the day was already bright, the signal was given from the king's tent with the horn; above the tent, from which it might be seen by all, there gleamed an image of the sun enclosed in crystal" (Quintus Curtius III.3.8♦).

When the court was on the move, the royal tent thus became the center of power, identifiable as it was with the king himself. Consequently, the capture of the royal tent by an opponent symbolically represented a transition from one power to another. Quintus Curtius in fact explains "it was an established custom that they should receive the victor in the conquered king's tent" (III.11.23♦). Thus, upon his victory over Astyages, Cyrus the Great entered the tent of the vanquished king, took the throne, and grasped his scepter; then one of his men, Oibaras, placed the *kidaris* (upright tiara), symbol of royalty, on his head (FCrH 90 F66.45). The Macedonian victory at Issus in 333 had the same result: "The royal pages now took over the tent of Darius and Alexander's prepared Alexander's bath and dinner and, lighting a great blaze of torches, waited for him, that he might return from the pursuit [of Darius'enemy] and, finding ready for him all the riches of Darius, take it as an omen of his conquest of the empire of all Asia" (Diodorus XVII.36.5♦).

Thus, there is no doubt that the king was also accompanied by the high officials who regularly assisted him with all his governmental duties. In one of his anecdotes on the relocations of the court, Aelian tells the following story:

Note that when travelling the Persian King took with him, in order not to be bored, a small block of lime wood tablet and a little knife to scrape it. This was the activit of the royal hands. He certainly did not take with him a book (*biblion*) or serious thoughts, in order to be able to read something important and improving or meditate on a noble and worthwhile subject. (VH XIV.14♦)

We can overlook the polemical slant of the remarks. Here an opposition is set up between books proper (philosophy, history)—"heavy, serious reading"—and the administrative use of writing. The anecdote gives an illustration of the situation we might expect: the king remained in contact with his satraps and subordinates through the intermediary of his chancellery, to which he continued to dictate letters and messages.

To sum up, custom led to the extension and relativization of the very notion of a capital in the Achaemenid Empire. Power was where the king was, whether he was residing in a palace or his tent, at Persepolis or in a paradise, at the heart of the Empire or at Sardis or even Memphis or Bactra.

Royal Arrivals and Departures

The political aspect of these migrations is strongly evidenced by the ceremony surrounding the arrival of the Great King in his cities. There is no doubt that the procession was organized according to strict rules fixed by protocol, as can be seen in the texts of Xenophon, Herodotus, and Quintus Curtius. One of the most interesting texts is the one in which Quintus Curtius (V.1.17–23⇨) describes the arrival of Alexander at Babylon in 331:

Now, as Alexander kept on his way to Babylon, Mazaeus, who had fled to that city from the battlefield [of Gaugamela], met him as a suppliant with his mature children, and surrendered the city and himself. His coming was welcome to the king; for the siege of so strongly fortified a city would have been a great task. Moreover, it was evident that a man of distinction and ready action, who had also gained widespread reputation in the recent battle, would by his example induce the rest to surrender. There fore the king received him courteously with his children; but he ordered his men to enter the city in square formation, with himself at their head, as if they were going into battle. A great part of the Babylonians had taken their places on the walls in their eagerness to become acquainted with their new king, still more had gone out to meet him. Among the latter Bagophanes, guardian of the citadel and of the royal funds, in order not to be outdone in alacrity by Mazaeus, had strewn the whole road with flowers and garlands, and had placed here and there on both sides silver altars, which he had piled high, not only with frankincense, but with perfumes of all kinds. As gifts there followed him herds of horses and cattle; lions and leopards too were carried before them in cages. Then came the magi, chanting a hymn after their manner, after them the Chaldeans, and of the Babylonians not only the prophets but also musicians with their own kind of instruments; the latter were accustomed to sing the praises of the kings, the Chaldeans, to explain the movements of the heavenly bodies and the appointed changes of the seasons. Lastly followed the Babylonian cavalry, whose apparel and that of their horses met the demands of luxury rather than of magnificence. Alexander, surrounded by armed men, had ordered the throng of townspeople to march after the hindermost of infantry; he himself entered the city in a chariot, and then entered the palace.

This text, clearly based on firsthand description, catalogs the various elements of a minutely organized ceremony. To be sure, like many other Hellenistic-period texts, it presents the displays accorded the king as spontaneous. The reality is quite different. Herodotus states clearly, for example, that before Xerxes arrived at his towns royal heralds were dispatched from Sardis to announce the imminent arrival of the royal procession and to notify the cities of the order to prepare the royal table (VII.32). The roads themselves were made ready: Aelian even states that on this occasion the inhabitants were required to kill all the scorpions on the road from Ecbatana to Persia (*Anim.* XV.26)! There is no trace of improvisation in any of this. Quite the contrary, every stage of the ceremony was prepared in advance, in collaboration with the local authorities. Before receiving Alexander at Susa several weeks later, the satrap sent his son "to meet the king"; for his part, Alexander sent one of his officials to make contact with the satrap Abulites in order to arrange the royal entry in accord with customary Achaemenid protocol (Arrian III.16.6).

In fact, the authorities were required to come before the king outside the ramparts of the city. It was the same at Sardis in the summer of 334: "When he [Alexander] was still about seventy stades [ca. 12 km] away he was met by Mithrenes, commander of the citadel garrison, and the chief citizens of Sardis; they gave up the city, and Mithrenes the citadel and treasury" (Arrian I.17.3♦). In Babylon, the authorities "surrender[ed] the city, the citadel and the treasure" (III.16.2♦). By coming before the king, they clearly indicated that their town was open and that they recognized their subjugation. The authorities were accompanied by corporate bodies: "The Babylonians came out to meet him in mass, with their priests and rulers."

Then came the entry into the town. In Babylon, Alexander rode a chariot. It is also possible that in some cases kings made their entrances on horseback (cf. Plutarch, *Them.* 29.7). Darius saw in one of his premonitory dreams, "Alexander . . . in the garb in which he himself had been made king, . . . riding on horseback through Babylon" (Quintus Curtius III.3.3♦). Established practice, however, required that the Great King parade in his chariot at official ceremonies. Xerxes' chariot was drawn by Nisaeon horses (VII.41♦). And Herodotus states: "When the fancy took him, he would leave his chariot (*harma*) and take his seat in a covered carriage (*harmamaxa*) instead." This small detail indicates that the procession described by Herodotus complied with a ceremonial order: it was in fact, according to Quintus Curtius, "an ancestral tradition." Thus, "he rode outstanding among the rest" (III.3.15♦). Diodorus (XVI.24.6) states that in his chariot the king would adopt and maintain a "hieratic" attitude and bearing and that he did not drive his chariot himself. Xerxes was "riding in a chariot (*harma*) drawn by Nisaeon horses, his charioteer, Patiramphes, son of Otanes the Persian, standing by his side" (Herodotus VII.40♦). Xenophon does not conceal the king's desire to awe the crowd of spectators, who were massed on both sides of the road:

His [Cyrus's] hands he kept outside his sleeves. With him rode a charioteer, who was tall, but neither in reality nor in appearance so tall as he; at all events, Cyrus looked much taller. And when they saw him, they all prostrated themselves before him (*proskynese*), either because some had been instructed to begin this act of homage, or because they were overcome by the splendour of his presence, or because Cyrus appeared so great and goodly to look upon. (*Cyr.* VIII.3.14♦)

The king then traversed the streets of the city, which in Babylon "were strewn with flowers and garlands" and redolent with the scent of incense and many other delightful perfumes—which very closely recalls Cyrus's entry two centuries earlier. Likewise, when Xerxes and his train crossed the bridge over the Hellespont, "they burned all sorts of spices on the bridges and laid boughs of myrtle along the way" (Herodotus VII.54♦). This was clearly a victory celebration: at the news of the victory of Salamis, "the Persians . . . strewed the roads with myrtle-boughs, burned incense, and gave themselves up to every sort of pleasure and merrymaking" (VIII.99♦). The king then performed sacrifices to the gods of the town and the country—Alexander never failed to do this, wherever he went. Thus "at Babylon . . . he met the Chaldaeans, and carried out all their recommendations on the Babylonian temples, and in particular sacrificed to Baal [Marduk], according to their instructions" (Arrian III.16.5♦). This ceremony demonstrates that the king was not only received by the population and its leaders, but also by their tutelary deities. Finally, it was the city's difficult task to provide for the royal table—an overwhelming expense, as Herodotus explains at considerable length (VII.118–20).

Court Nomadism and a Survey of the Imperial Realm

It thus seems clear that the movements of the Achaemenid court took on major political and ideological significance. During his travels, the Great King, as it were, visited the peoples of his Empire. He who was ordinarily so far away could show off to everyone the might and wealth of his court and army. The Persian custom might be compared with the "royal entrance" in medieval France, of which it has been said: "At the end of the Middle Ages, monarchic sentiment was fostered by the numerous entries that the king made into all his major cities during his progress throughout the kingdom. . . . First, it was just a festival, then it took on a quasi-religious solemnity; by the end of the fifteenth century a royal entry had become a great spectacle, wherein the king's councillors intended to lay out all the themes of monarchic propaganda."

During the process of relocating, the king also passed through villages and encountered peasants. Because of the military orientation of the Classical and Hellenistic sources, we are naturally less well informed on this aspect. But when the royal procession passed through a district, the local people crowded in all along the route. This is evidenced by the following remark of Quintus Curtius, describing Darius III's retreat toward Media after the battle of Gaugamela, during which he took a side trip: "From the villages nearest to the road the shrieks of old men and women could be heard, who in the barbarian manner were still calling on Darius as their king" (IV.16.5♦). Diodorus's description of the route of Alexander's funeral chariot from Babylon to the Mediterranean coast might also be mentioned:

Because of its widespread fame it drew together many spectators; for from every city into which it came the whole people went forth to meet it and again escorted it on its way out, not becoming sated with the pleasure of beholding it. (XVII.28.1♦)

A passage in Herodotus also seems to indicate that, during his stay at Sardis, Darius held a "seat in state" on the outskirts of the city (V.12♦). There is no doubt in any case that local populations took advantage of the king's presence to bring petitions and claims, as Xenophon explains in the *Cyropaedia* while describing the organization of the royal procession on the occasion of the parade held at Persepolis: "As he proceeded, a great throng of people followed outside the lines with petitions to present to Cyrus." Then he "sent them some of his mace-bearers (*skēptoukhoi*), who followed three on either side of his chariot, for the express purpose of carrying messages for him; and he bade them say that if any one wanted anything of him, he should make his wish known to some one of his cavalry officers and they, he said, would inform him" (VIII.3.19–23♦). The same concerns led to Artaxerxes II's instruction that his wife Stateira should travel in an open vehicle; anyone might seek her out to present a request: her chariot "always appeared with its curtains down, allowing her countrywomen to salute and approach her, which made the queen a great favourite with the people" (Plutarch, *Art.* 5.6♦).

Gifts and Presents

Moreover, Arrian explains, "each section of the inhabitants [brought] gifts" to Alexander (III.16.3♦). This meant, notably, presents of animals, including exotic ones: in Babylon, caged lions and panthers (Quintus Curtius V.I.21); in Susa, "Abulites met him with gifts of regal splendour. Among the presents were the camels known as dromedaries and of extraordinary swiftness, twelve elephants imported by Darius from India" (V.2.10♦). The gifts were often gold and silver crowns, as shown by an inventory of the

Achacmenid treasury at Susa in 317: “There was collected for him [Antigonos], besides, a great amount of money from the crowns and and other gifts, and also from the spoils. This came to five thousand talents” (Diodorus XIX.48.7◊). The inhabitants of the Phoenician towns also greeted Holophernes with crowns as a sign of voluntary submission: in violation of every precedent, however, the Persians “laid their land waste and cut down their sacred trees” (Judith 3:7–8◊).

Note the especially interesting, long passage by Theopompus of Chios, known from a late quotation (FGrH 115 F263a), some of which is repeated by Athenaeus (II.77 = F263b). The author was obviously very fond of Persian royal customs and dedicated numerous passages to the luxury of the royal table and to the movements of the Great King. He is the one, for instance, who provides information about the requirement to feed the king and those with him, which weighed on the peoples and cities visited by the king and court (see p. 403 below). The passage that is quoted here at length may refer to the expedition mounted by Artaxerxes III to reconquer Egypt in 343. Here is how—and how enthusiastically!—Theopompus describes the gifts and gift-givers who hastened to the path of the royal caravan on the road:

Is there any city or people of Asia that didn't send embassies to the king? Is there any produce or any fine and valuable product of their workshops that they did not bring as gifts (*dōron*) to lay down before the king? Many splendid counterpanes, fine blankets, some purple, some multi-colored, some white; many tents fitted out in gold and fully equipped; not to mention many tunics and costly, splendid couches; and on to chased silver and gold worked to perfection, cups and bowls, some covered with precious gems, others appearing to be worked with elegant simplicity. And above and beyond all that, uncountable myriads of arms, both Greek and Barbarian, and an unbelievable number of teams and fatted animals for sacrifice, along with many *medimnes* ['bushels'] of seasonings, many sacks of money, and a large amount of writing-papyrus, and among all the other things everything needed for sustenance, including the meat of sacrificial animals preserved in salt in such quantity that the folks who approached had the impression of seeing mountains and hills raised before them!

Several anecdotes preserved by Aelian describe the obligations that fell on the Persian peasants when Artaxerxes II's royal procession passed near their fields and villages:

A custom most carefully maintained by the Persians (*nomos persikos*), when the king drives to Peisepolis, is that each and every one of them, according to his means (*kata tēn heautou dynamin*), brings an offering. Since they are engaged in farming and toil on the land, living by what they produce (*autourgoi*), they bring no pretentious or unduly expensive gifts, but rather oxen, sheep, or corn, or in other cases wine. As the king passes and drives on his way these objects are laid out by each man, and are termed gifts (*dōron*); the king treats them as such. Men who are even poorer than these farmers bring him milk and dates and cheese, with ripe fruit and other first fruits of local produce. (I.31◊)

It was shameful to disregard the custom (*nomos*; I.32). It was an honor to bring even the smallest present: Aelian tells the story of a particularly impoverished Persian who could offer Artaxerxes no more than a skin of water from the Cyrus River, and another who modestly brought him a single pomegranate. The former was honored with the title Benefactor (I.33; cf. Plutarch, *Art.* 4.4–5; 5.1). The exchanges of gifts that took place on this occasion rendered the generosity of the Great King all the more striking and strengthened his ties with the people.

Gifts to the Great King and Political Submission

There can be no doubt that the offering of gifts took on major political significance. They provided a visible illustration of the submission of the town and population before royal might. Everyone was obligated, especially the rich. On the way to and from his European campaign, Darius crossed Asia Minor and stayed at Sardis. It is quite certainly on this occasion that the wealthy Pythius of Celaenae offered the king the famous golden plane tree. Later, in 480, "at Celaenae [he] was awaiting Xerxes, and on his arrival entertained him and the whole army with most lavish hospitality" (Herodotus VII.27♦). The satrap himself also was required to greet the king regularly. Among other examples we may consider Orxines, who took for himself the title Satrap of Persia. When Alexander neared Pasargadae on his return from Carmania, Orxines came to greet the king "on the Persian border" (Arrian VI.29.2♦):

He met the king with gifts of every kind, intending to give presents not only to Alexander but to his friends as well. Troops of trained horses followed him and chariots adorned with silver and gold, costly furniture and splendid gems, golden vases of great weight, purple vestments, and 3,000 talents of coined silver. (Quintus Curtius X.1.24♦)

This is confirmed in the tales of Alexander's campaigns. Many peoples and towns awarded him crowns. Every time he turned up at the frontiers of a kingdom or city in India, he was greeted by ambassadors bearing gifts representing the country's products or most valuable possessions. For example, Omphis offered him "fifty-six elephants, . . . besides many head of sheep of extraordinary size and about 3000 bulls." "He entrusted his person and his realm to a prince" (Quintus Curtius VIII.12.7-11♦). Again, these Indian kings were simply following the orders of Alexander, who "having sent a herald in advance to Taxilas [Omphis] and the Indians on this side of the river Indus with orders to meet him, each at their earliest convenience; Taxilas and the other hyparchs complied, bringing the gifts the Indians prize most" (Arrian IV.22.6♦). Poros also received an envoy from Alexander, "to demand that he should pay tribute and meet Alexander at the frontier of his territories" (Quintus Curtius VIII.13.2♦). Open refusal to bring gifts was taken as proof of insubordination. This would have been the case with the Indian king Musikanos, who "had not yet met him to surrender himself and his country, nor had sent . . . any gifts suitable for a great king, nor had he made any request from Alexander." As soon as he heard of the arrival of the Macedonian army, however, Musikanos hastened before Alexander, "bringing gifts of the greatest value among the Indians, . . . submitting himself and his people" (Arrian VI.15.5-6♦).

As the Cyrus of the *Cyropedia* puts it, the satraps were obligated "to send back here what there is good and desirable in their several provinces" (VIII.6.6♦); as for the subject peoples, "those of every nation thought they did themselves an injury if they did not send to Cyrus the most valuable productions of their country, whether the fruits of the earth, or animals bred there, or manufactures of their own arts" (VIII.6.23♦). By coming in person to take possession of these symbolic gifts, the Great King reminded the cities and peoples that their most marvelous products were reserved for him alone. Every available text indicates that in this way the Great Kings periodically reaffirmed their dominion over the peoples they controlled. They recalled their obligations to them and constrained them to exhibit publicly their subjugation by the offering of gifts. In this way, they also staked out the extent of their immediate power over territories and subjects, a

power that could only be perpetuated by the delegation of the Great King, who indeed remained far away but who was always able visibly to impose his presence and authority, whether directly by his relocations or indirectly by the intermediary of his satraps.

The Return to Persepolis via Babylon

The nature, function, and methods of presenting these gifts irresistibly make us think of the Persepolis donor friezes. If we agree to set aside the question of the New Year per se (this chronological question is secondary), it is not out of the question that the friezes metaphorically and vividly depict a festival during which delegations of the peoples of the Empire came to present to the king the best-known products of their countries. In the absence of real Achaemenid written documents, this hypothesis tempts us to refer to the delegations received from the "entire world" by Alexander at Babylon in 324:

From practically all the inhabited world (*oikoumenē*) came envoys on various missions, some congratulating Alexander on his victories, some bringing him crowns, others concluding treaties of friendship and alliance, many bringing handsome presents (*dōreai megaloprepis*), and some prepared to defend themselves against accusations. Apart from the tribes and cities as well as the local rulers of Asia, many of their counterparts in Europe and Libya put in an appearance. . . . Alexander drew up a list of the embassies and arranged a schedule of those to whom first he would give his reply and then the others in sequence. First he heard those who came on matters concerning religion; second, those who brought gifts; next, those who had disputes with their neighbours; fourth, those who had problems concerning themselves alone; and fifth, those who wished to present arguments against receiving back their exile. . . . receiving their petitions in the order of importance of the sanctuaries. In all cases he made every effort to deliver replies which would be gratifying, and sent everyone away content so far as he was able. (Diodorus XVII. 113⇨)

Whatever the specifics, this great meeting in Babylon was *perhaps* nothing other than an imitation of an Achaemenid festival of the same kind, a festival of imperial power, during which the many countries known to submit to the Great King came bearing gifts, seeking audience, and requiring his arbitration. Arrian does not conceal the obvious political significance: "It was then more than ever that both in his own estimation and in that of his entourage Alexander appeared to be master of every land and sea" (*Anab.* VII.15.5⇨). And we can understand the deep irritation felt by the Macedonian toward the Arabs and the interpretation provided by Arrian: "[Alexander's] naval preparations were directed at the greater number of the Arabs, on the pretext that they alone of the barbarians in these parts had sent no envoys and had taken no other action reasonable or honorific to him. The truth in my own belief is that Alexander was always insatiate in winning possessions" (VII.19.6⇨).

However, it is obvious that resorting to a text from Alexander's time—from Babylon, no less—cannot alleviate doubt about the reality of an official ceremony of gift-giving at Persepolis. By way of supplementary evidence, we may cite, not without reservation, a passage from Pliny that lists a locality called Caphrena in Upper Mesopotamia on a road to Syria. Pliny describes it as an old satrapal residence (*satraparum Regia* [= *basileion*] *appellatum*), which by his time had been demoted to a citadel (*arx*); he presents its past political function as follows: 'Where tributes used to be brought' (*quo tributa conferebantur*; *NH* VI.30.119–20). It thus seems that in the olden days (in the Persian period?) there must have been an official ceremony of tribute-bringing in the satrapal residence. Since most of the rules regulating satrapal court life were copied from central court reg-

ulations, we are tempted to think that this kind of ceremony for bringing representative gifts really did take place at Persepolis. However—let us say it one more time—the allusive and late character of the sources means that any conclusion is weak and uncertain. Let us simply stress that the Classical texts require us to leave the question open.

5. Images and Realities: The Imperial Festivals

The Large Army of Xerxes

Among these colorful depictions of the Empire and its peoples is Herodotus's long passage devoted to the description of Xerxes' army (VII.59–101). Herodotus places the scene in Thrace, on the plain of Doriscus, where Darius had established a royal residence (*basileion*) and a garrison. On that spot, Xerxes took a census of the army. "After the counting, the army was reorganized in divisions according to nationality" (*kata ethnea*; §60♦). Then Herodotus gives his readers an exhaustive list of 47 contingents, from the infantry, the cavalry, and also the navy. For each ethnic contingent, he gives a description of the clothing and weaponry, along with the name of the Persian who commanded it.

Among the many problems posed by this most interesting document, we will stress one in particular: the extraordinary diversity of the highly variegated army. Many of the contingents are distinguished by "exotic" uniforms. Some (Caspians, Pactyans, Utians, Myci, Paricanians) "were dressed in skin with the hair on"; the Ethiopians from Africa "in their leopard and lion skins . . . when going into battle they smeared half their bodies with chalk and the rest with vermilion"; the Ethiopians from Asia "wore headdresses consisting of horses' scalps, stripped off with the ears and mane attached—the ears were made to stand erect and the mane served as a crest";♦ "the Thracian troops wore fox skins as a headdress . . . and high fawnskin boots."♦ There was no less diversity in weaponry: some used wicker [*gerthai*] shields (Persians), others oxhide shields (Paphlagonians), still others "for shields they used crane skins"♦ (Ethiopians of Asia); some wore wooden helmets (Colchians), others bronze helmets (Assyrians), still others "helmets helmets, crested, and decorated with the ears and horns of an ox, also in bronze"♦ (Paphlagonians); there were also wooden clubs embellished with iron nails (Assyrians, Ethiopians of Asia), axes [*sagaris*] (Saciens), "arrows tipped not with iron but with stone worked to a fine point,"♦ or "spears with spearheads of antelope horn"♦ (Ethiopians of Asia), and so on.

The mounted troops also do not seem very homogeneous, in spite of being reduced to a few ethnic contingents. Alongside the literal cavalry were "saddle horses and chariots drawn by horses and wild asses" (Indians), as well as herds of camels (Arabs). Even within the cavalry, Herodotus singles out the Sagartians' peculiar style of combat:

A nomad tribe called Sagartians, a people who speak Persian and dress in a manner half Persian, half Pactyan; these furnished a contingent 8000 strong. Their custom is to carry no weapons of bronze or iron except daggers; the special weapon on which they chiefly rely is the lasso made of plaited strips of hide. In action, the moment they are in contact with the enemy, they throw their lassos (which have, of course, a noose at the end) and haul towards them whatever they catch, horse or man. The victim, tied up and helpless, is then dispatched. This is their way of doing battle. The Sagartian contingent was organized to form a single unit with the Persians. (§85♦)

One question comes up right away: how were the Persian commanders able to direct operations with such a diversity of troops, considering both their weaponry and their style? One possibility springs to mind immediately: it was exactly this diversity and chaos that enabled the Greeks to beat the Persians or that brought Darius III to defeat after defeat at the hands of the Macedonian armies. But this interpretation must be rejected, because on the one hand it agrees too well with the Greek interpretations and on the other hand, and more importantly, it misunderstands a basic fact: quite simply, most of the contingents described by Herodotus never went into battle at all.

At Thermopylae, the assault was led by elite troops: Medes, Cissians, then the Immortals (ordered to turn the flank) (Herodotus VII.210–11, 215; Diodorus XI.6–8). Here are the contingents picked by Mardonius when Xerxes retook Sardis after Salamis:

[Along with the Ten Thousand] Mardonius . . . chose . . . the Persian spearmen and the picked cavalry squadron, a thousand strong; and, lastly, the Medes, Saka, Bactrians, and Indians, both horse and foot. These contingents he took over complete; from the troops of other nationalities (*symmakhoi*) he picked a few men here and there, being guided in his choice either by their appearance or by his knowledge that they had distinguished themselves, until he had a total number, including the cavalry, of 300,000 men. The Persians with their necklaces and armlets [the Ten Thousand] provided the largest contingent; next were the Medes—though the Medes were not actually inferior in number, but only in quality. (VIII.113♦)

Further on, Herodotus gives Mardonius's order of battle at Plataea, and he states very clearly that the front lines comprised Persians, Medes, Bactrians, Indians, and Sacians (IX.31). This was also true at Mycale, where the Persians encountered a frontal assault (IX.102). At Plataea, Herodotus identifies the allies selected by Mardonius: Greeks and Macedonians, Phrygians, Mysians, Thracians, Paeonians, and some Ethiopians and Egyptians (IX.32). Regarding the Egyptians, Herodotus includes the following detail: "They had previously served with the fleet, but Mardonius brought them ashore before leaving Phalerum; there were no Egyptian troops in the land force which Xerxes brought to Athens" (IX.32♦). For two reasons, we may not conclude that the contingents from Doriscus had set out: (1) only elite warriors could be chosen, as Herodotus makes very clear regarding the Egyptians themselves; and (2) Herodotus states several times that the *epibates* (marines) were exclusively Persian, Mede, and Sacian (IX.96.184). For reasons that are easily understood, the fighting army per se thus comprised Persian and Iranian troops. It seems equally clear that the 47 ethnic contingents enumerated by Herodotus at Doriscus had never seen battle. We must conclude from this that if Xerxes ever really did impose a general military conscription on his subjects (which itself seems rather doubtful), it was for reasons that had nothing to do with military logic.

Imperial Reviews

An initial review of troops took place at Abydos, before crossing the Hellespont:

It now occurred to Xerxes that he would like to hold a review of his army. On a rise of ground nearby, a throne of white marble had already been prepared for his use, and at his orders, by the people of Abydos; so the king took his seat upon it and, looking down over the shore, was able to see the whole of his army and navy at a single view. Suddenly as he watched them he was seized by the whim to witness a rowing-match. The match took place and was won by the Phoenicians of Sidon, to the great delight of Xerxes who was as pleased with the race as with his army. (Herodotus VII.44♦)

Xerxes organized another review at Doriscus, in Thrace, after the census of the army:

When the counting and marshalling of the troops had been completed, Xerxes thought he would like to hold a general review. Accordingly he drove in his chariot past the contingents of all the various nations, asking questions, the answers to which were taken down by his secretaries, until he had gone from one end of the army to the other, both horse and foot. Next the ships were launched, and Xerxes dismounting from his chariot went aboard a Sidonian vessel, where he took his seat under a canopy of gold and sailed along the line of the anchored fleet, asking questions about each ship and having the answers recorded, just as he had done with the army. The ships' masters had taken their vessels some four hundred feet from the beach, and brought up there in a single line with the bows turned shoreward and the fighting men drawn up on deck fully armed as for war. To hold his review, Xerxes passed along between the line and the shore. (VII.100⇨)

These examples speak for themselves: Xerxes was not interested in his military forces but in the ethnic and cultural diversity of the peoples of his empire; rather than a review of the troops, this was a review of the Empire. One of the most important elements of the symbolism of this review, we must emphasize with Herodotus, was that the command of the ethnic contingents, hitherto in the hands of native chieftains, was handed over exclusively to Persians, often of very high birth (VII.81, 96). This arrangement marvelously illustrates and reinforces this reality: the Empire of the Great King was a Persian Empire.

It is possible that, by organizing this sort of gathering, the king was also seeking to strengthen the morale of his troops—this, at least, is Quintus Curtius's interpretation (III.2.1). But that is not the heart of it. By passing in front of the contingents arranged by peoples (*kata ethnea*), Xerxes informed himself about the various people/countries (*dahyāva*) whose mobilization in itself constituted a sign of his power and whose diversity accounted for the immensity of an Empire he did not know very well. At this point, one is reminded of Arrian's commentary on the gathering of delegations at Babylon in 324: "It was then that the Greeks and Macedonians first came to be acquainted with their names and appearances" (VII.15.4⇨). One also thinks of what Quintus Curtius wrote of Darius III's army prior to Issus: "The Bactriani, the Sogdiani, the Indi, and other dwellers near the Red Sea [Persian Gulf], whose names were unknown even to Darius himself" (*ignotum etiam ipsi gentium nomina*; III.2.9⇨). Remember also the army of this same Darius, which was lined up at Gaugamela after being counted in the same fashion as described by Herodotus at Doriscus: "These were followed by other nations (*nationes*), not very well known even to their allies. Phradates came after these nations, leading fifty four-in-hand chariots (*quadrigae*), with a large army of Caspii. The Indi and the rest of the dwellers on the Red Sea [Persian Gulf], mere names rather than auxiliaries (*nomina verius quam auxilia*), were behind the chariots" (IV.12.9⇨). These words of Quintus Curtius confirm the truth of the distinction that must have been maintained between two kinds of royal troops: the fighting army (comprising several select ethnic contingents, essentially Iranian), and the ceremonial army (actually a microcosmic representation of the imperial realm, a gathering of all of the conscripts, including those who came from peoples whom the king and court would encounter only in the most unusual circumstances).

The convocation of the royal army in its entirety was thus a response to motivations that were more ideological than strategic—never mind that such gatherings generated

enormous logistical problems. Just as court nomadism allowed the power and wealth of the Great King to be displayed everywhere, so also these reviews constituted neither more nor less than stagings of the Empire. Furthermore, the notion of "imperial games" is well illustrated by the organization of boat races on the coasts of Abydos. "The greatest pomp and circumstance," Herodotus remarks again, after describing the army's crossing of the bridges, which "occupied seven days and nights without a break" (VII.56–57♦). Note also Xerxes' reaction after the review at Abydos: "When he saw the whole Hellespont hidden by ships, and all the beaches of Abydos and all the open ground filled with men, he congratulated himself"♦ [cf. OPers. *šiyāti*]—that is, he rejoiced in the power that he himself had just staged. The spectacle was designed less to impress the Greeks than to hand the Great King a mirror in which to contemplate his own power.

It must be stressed at this point that the tale of the march of Darius in 513 recounted by Herodotus describes a similar circumstance. After arriving at Chalcedon, "Darius . . . took ship and sailed to the Cyanean rocks . . . seated in the temple which stands by the straits, he looked out over the Black Sea— a sight indeed worth seeing" (IV.85). Then, after contemplating the Bosphorus, he raised two white marble stelas on its shore and engraved them—one in Assyrian characters, the other Greek—with the names of all of the peoples he had brought with him; and he had brought with him all of the peoples over whom he ruled" (IV.87). Were there ever such stelas? We might argue. But it is clear that at least in the mind of Herodotus they were intended less to transmit archival-type information than to exalt the territorial power of the Great King—just like, for example, the stelas that (always according to Herodotus) Darius erected at the sources of the Taurus as if to survey his new conquests (IV.91). And just like Xerxes at Abydos, "Darius himself sitting on his throne, with the army crossing over" (IV.88♦).

All in all, we do well to inquire whether the exceptional character of the Doriscus review is not a function first and foremost of the very uneven distribution of our evidence. Would not what we see at Abydos have been reproduced fairly regularly at the royal residences, comparable to the review organized by Cyrus the Younger at Tyriaeum for Epyaxa, queen of Cilicia? Standing in his war chariot, Cyrus passed by the troops, reviewing "the whole front," before pretending to launch his troops into combat. He "was delighted to see the terror with which the Greeks inspired the barbarians" (*Anab.* I.2.14–18♦).

Datames' Staging

An indirect index can be obtained from a passage in the *Life of Datames* by Cornelius Nepos. The satrap Datames had just won a victory over Thuys, dynast of Paphlagonia:

Datames did not want word of his success to reach the king [Artaxerxes II] from anyone but himself and acted accordingly. This is why, without his entourage's knowledge, he went to the royal residence (*eo uberat rex*). The next day he dressed Thuys, a large man of frightening physique because of his black skin, long hair, and full beard, in the luxurious garment worn by the royal satraps, adorning him also with a gold necklace and bracelets and all the royal jewels. He himself wore just a short, lined peasant cloak and a tunic of coarse fabric, with a hunting helmet on his head and in his right hand a club and in his left a leash attached to Thuys. He pushed him in front of him as if he were leading a beast captured in the hunt. Everyone stared at the prisoner because of the weirdness of his attire and his alien appearance. A great throng of the curious gathered, including some who recognized Thuys and alerted the king. At first the king refused to believe it and sent Pharnabazus to investi-

gate. As soon as he found out, he immediately ordered the procession to enter; he was delighted with the capture and the manner of presentation, and especially that an important king had fallen so unexpectedly into his power. He repaid Datames with magnificent presents. (3.1-5)

Like Herodotus, this author insists on the totally exotic and outrageous nature of the conquered and the utter strangeness of the costume, which was in fact the Paphlygonian peasants' everyday garb. In fact, the context is clearly quite different from Herodotus's descriptions. In Herodotus we are in the domain of a literature derived directly from a familial tradition intended to stress Datames' ingenuity and his feel for the workings of the court (in the political sense—that is, to achieve distinction for the services he had just rendered to the Great King). In C. Nepos, we no longer have a review of the troops but the arrival of a captive with a rope around his neck, like the liar-kings at Behistun.

Nevertheless, these differences in context do not impinge on the rationale of the descriptions, which bear the same symbolic weight. In actuality, this event was also a court spectacle, in which the subjugated people lined up before the king and court. For, make no mistake, Thuys was accompanied by a number of his inner circle and conquered subjects. We might suppose that such a staging—whether or not it actually took place!—could not have had the operative value placed on it by Cornelius Nepos's informants unless the king and court regularly witnessed parades of subjugated peoples, dressed in their traditional costumes. Their foreignness only rendered even more obvious the superiority of the Persians, who wore their splendid robes decorated with costly jewelry, striking symbols of their privileged status in the Empire. In a way, Datames' parade may be considered a muted echo of the imperial festivals regularly held in the royal residences.

From Artaxerxes III to Ptolemy II

Note, finally, that this interpretation of imperial festivals can be presented as no more than plausible. Spirited exaltations of imperial power are found in other contexts as well. Consider, for example, the Athenian festival in which the revenues from the tributes levied each year on the allies of the Delian League were presented (Isocrates, *Peace*, 82). But the *pompē* ['procession'] of Ptolemy Philadelphus is perhaps the most comparable. It was obviously a court festival where the king strikingly demonstrated his wealth and power. "The procession ended with a military parade involving 57,600 infantrymen and 23,300 cavalrymen, all armed, an impressive demonstration of the Ptolemaic army." The link between territorial power and tribute levies was clearly evident in the composition of the procession:

Each person symbolized a geographic region. This was true for women dressed as Indian captives and others who embodied the Greek towns of Asia, as well as "Ethiopian tribute-bearers." They represented the zones through which Ptolemaic power extended, whether in fact or purely in the imagination (India, Ethiopia). . . . The propaganda brought forth during the festival also had an undeniable political aspect. In part it affirmed the tie that bound Ptolemy II and Alexander, especially the development of the theme of the extension of Ptolemaic power beyond the frontiers of Egypt. The carts for the "barbarian" tents with Indian and other women "held captive" and the "Ethiopian tribute-bearers" embodied the pretensions of the Ptolemaic king to universal dominion; it is quite clear that neither India nor Ethiopia was in his power, but it is striking to observe that under Ptolemy II, as at the time of the Egyptian New Kingdom, the representatives of the foreign countries could only be considered "tributaries" of the Egyptian king. . . . Thus, the images of the festival

evidenced the extent of subject territory; the theme was developed in part on "historical" grounds—the concrete existence of territories occupied by Ptolemaic troops—and in part due to propagandistic amplification. (F. Dunand)

Even though we recognize the Greek elements as the most notable (this is a Dionysiac procession), it would not be surprising if Ptolemaic (or Seleucid: Daphne procession) sovereigns had adapted an Achaemenid festival for their purposes in the same way that the Hellenistic custom of royal entrances seems to have been copied from analogous Achaemenid-period ceremonies. In many ways, the *pompē* of Ptolemy described by Callixenus makes us think of the *pompē* of Artaxerxes III described by Theopompus (FGH 115 F263a), and the preceding analyses show that it is logical to assume that this type of festival organized for the relocating of the Great King also took place more regularly (though not necessarily during the New Year) in the capitals of the Empire.

6. Royal Table and Royal Paradise: Exaltation of the Center and Appropriation of Space

Whatever interpretation we adopt, the message of the "tribute" reliefs of Persepolis is as clear as the image obtained from the Classical texts. In the imperial concept, the subjugated peoples participated in the ostentatious richness of the Great King and his court. This in fact is the understanding offered by all of the ancient authors, fascinated as they were by the gigantic magnet drawing the manpower and products of the conquered peoples toward the center. Of all the symbols of this power to impose tribute, the Greeks were particularly impressed by the splendor and luxury of the king's table. In the polemical portrait of the Great King drawn in the *Agésilas*, Xenophon writes: "The Persian king has vintners scouring every land to find some drink that will tickle his palate; an army of cooks contrives dishes for his delight" (§9.3♦). Many Greek authors returned to this theme, often stating that the Great King regularly rewarded those who brought new foodstuffs for his table with prizes and payment (cf. Athenaeus IV.144a; XII.529d, 539d, 545d). The king's table in its sumptuousness and variety was in fact considered emblematic of the political and material might of the Great King.

In the mind of the Greek authors, the table was provisioned by taxing the conquered peoples. This is precisely the function assigned by "Cyrus" to his satraps: "Send back here what there is good and desirable in their several provinces, in order that we also who remain here may have a share of the good things that are to be found everywhere" (*Cyr.* VIII.6.6; cf. 6.23). This is also the sense of the apothegm recorded by Dinon via Athenaeus (XIV.652b-c♦):

They used to set on the king's table all the delicacies produced by the country over which the king ruled, the choice first-fruits of each. For Xerxes did not think that the princes should use any foreign (*xenikos*) food or drink; this is why a custom forbidding such use arose later. Once, as a matter of fact, one of the eunuchs brought as one of the desserts some figs from Attica and Xerxes asked where they came from. When he learned that they were from Athens, he restrained his suppliers from buying them until the time came when he could seize them whenever he wanted without purchasing them. And it is said that the eunuch had done this on purpose to remind the king of the expedition against Athens.

The meaning of the little tale is clear: the king does not buy; he takes. A country that has not surrendered and thus does not send assessments to the royal table is considered "foreign." These assessments are assimilated to tribute by the Greek authors. In his (unfortu-

nately lost) work *On the Tributes Levied in Asia*, Ctesias enumerated all of the products furnished to the Great King for his meals (FGrH 688 F53). He listed, for example, "acanthus oil from Carmania, which the Great King used" (Athenaeus, II.67a). Amyntas states that in some districts of Persia "the mountains produce . . . Persian nuts from which much oil is prepared for the king" (ibid.). It was probably the same for the vineyards planted by the Persians in Syria, near Damascus, whose yield was restricted to royal consumption, and also the wheatfields of Assos in Aeolis (Strabo XV.3.22). Note also that, among all the varieties of dates, Theophrastus (HP II.6.7) singles out one called "royal," which was notoriously rare: "It was seen only in the garden of Bagoas (*en monōi tōi Bagōou kēpōi*), near Babylon." The information is repeated by Pliny (VI.143):

Of all the dates, the most famous came from Babylon, exclusively from the garden of Bagōas (*Babylono natae uno in horto Bagou*), and were honored with the qualification "royal," because they were reserved for the kings of Persia.

Another illustration of the centripetal traffic of the products of the Empire is provided by the royal paradise. The paradises were vacation spots and hunting preserves, and they also included gardens planted with trees. They were zoological gardens, where kings and satraps introduced new species of plants and animals, a feature that was well documented already in the Neo-Assyrian period. Many kings boasted of having brought new lands into production, of having brought in water, and of having planted different trees, such that they could relax in magnificent gardens and orchards, full "of every sort of aromatic and scented plant" (Sargon; compare Xenophon, *Oec.* IV.21: "sweet scents clung round them as they walked"). The evidence for the Achaemenid period is less abundant but equally telling. The paradises are regularly characterized as including every species of tree bearing every fruit of the earth (e.g., Xenophon, *Anab.* I.4.10; II.4.14). They are "groves artificially planted" (Quintus Curtius VII.2.22↔; Xenophon, *Oecon.* IV.21), that is, carefully tended gardens. They are also encountered in the Persepolis tablets (PFa 1; 33). Aelian compares the Indian kings' paradises with the Persian paradises of Susa and Ecbatana; always maintaining that the former are still more beautiful than the latter, he leads us to think that they are characterized by the same wealth of animals and trees as was brought under the care of 'the kings' superintendents' (*hoi meleđōnes hoi basileioi*; *Anim.* XIII.17). Elsewhere, he speaks with wonder of the paradises of Susa, where specially trained oxen hoisted the water for the fields (*Anim.* VII.1). As in Egypt and Assyria, exotic plants and animals from all the subjugated countries were gathered—such as the "camels known as dromedaries and of extraordinary swiftness, twelve elephants imported by Darius (III) from India" that the satrap of Susa offered to Alexander (Quintus Curtius V.2.10↔). Aristotle records that Pharnaces acclimated mules to Hellespontine Phrygia (doubtless in the paradise near Dascylium; *Hist. An.* VI.26.580b). And it was very likely in his position as superintendent of a paradise that Gadatas received the congratulations of Darius for having planted trees that came from Syria near Magnesia on the Meander (ML 12).

It is easy to understand that the Achaemenid model was copied by minor local princes eager to identify with the Great King, such as Polycrates of Samos (pp. 83f.) and Cotys of Thrace. Theopompus describes one of the dynast's residences thus:

Onocarsis, an estate in Thrace which included a very beautifully planted grove (*alsos*) and one well adapted for a pleasant sojourn, especially during the summer season. In fact it had been one of the favourite resorts of Cotys, who more than any other king that had arisen in

Thrace, directed his career towards the enjoyment of pleasures (*hēdypathēia*) and luxuries (*tryphē*), and as he went about the country, wherever he discovered places shaded with trees and watered with running streams, he turned these into banqueting places (*hestiatōria*); and visiting them each in turn, as chance led him, he would offer sacrifices to the gods and hold court with his lieutenants, remaining prosperous and envied. (Athenaeus XII.531e-6)

Cotys thus regulated space, the paradise demonstrating symbolically the control and exaltation of his territorial power. The Achaemenid model cannot be doubted: the Great King himself moved from paradise to paradise, where the 'royal stations' were (*stathmoi basilikoi*; cf. Plutarch, *Art.* 25.1). At each stop, the model of the royal table was reproduced (cf. 24.3): Alcibiades understood this perfectly, because he too tried to profit from the symbolism proclaimed by the rules of Achaemenid court nomadism (cf. Athenaeus XII.534d; Plutarch, *Alc.* 12.1). There is hardly any further doubt that the open competition between Straton of Sidon and Nicocles of Paphos over the luxury of their tables was based on conscious imitation of the king's table (cf. Athenaeus XII.531c-e; Aelian, *VH* VII.2).

The same holds for Harpalus, treasurer of Alexander posted to Babylon, who adapted the Persian paradises to the ideological advantage of the Macedonian conquerors:

Harpalus . . . was desirous to adorn the palace gardens and walks with Grecian plants, succeeding in raising all but ivy, which the earth would not bear, but constantly killed. For being a plant that loves a cold soil, the temper of this hot and fiery earth was improper for it. (Plutarch, *Alex.* 35.15♦)

There is little doubt that Harpalus was engaged in imitation and that it was on the orders of Alexander. This is also suggested by Pliny (VIII.44):

Alexander brought under his control, across the entire extent of Asia and Greece, several thousand men who lived for hunting, birding, or fishing, or who maintained breeding-grounds, flocks and herds, apiaries, fisheries, and aviaries, so that no creature remained unknown to him.

Alexander was careful to turn paradises to his advantage as the symbol par excellence of imperial dominion. Paradises in fact constituted a representation in microcosm of the ecological, floral, and faunal variety of the imperial realm. We can easily compare them with this recent semiotic interpretation of the gardens of Versailles under Louis XIV:

The place where [the prince] resides seems to expand to the size of the universe. Garden and palace thus appear to be a miniature compendium of the entire world. . . . This exemplary place contains the most beautiful and rare of what the outside world produces and transforms them into a sign. Versailles becomes the show-window of the world; exotic plants, Dutch flowers, wild animals, rare birds, and objects brought from the four corners of the universe are all perpetually found there. They are presented, they appear together, as a whole, without undergoing the ordinary constraints of merchandise, of payment, of time and space. Not having succeeded in creating a universal monarchy, the kingdom conquered the world in the form of signs; he reconstructed the earth entire in his garden; he played with a scale model of the universe that he could alter as his whim desired. (J. M. Apostolides)

Table and paradise thus participate in the exaltation of royal splendor. So do human assessments, as seen in the text of the edict (surely apocryphal) recorded by the redactor of the book of Esther. After the repudiation of Queen Vashti, King Ahasuerus made a proclamation throughout his entire kingdom:

Let beautiful girls be selected for the king. Let the king appoint commissioners throughout the provinces of his realm to bring all these beautiful young virgins to the citadel of Susa, to the harem. . . . (2:2-3♦)

The most beautiful women of the Empire were required to come to enchant the nights of the Great King, just as the most celebrated products of the various countries were required to come to enhance the luxury of the royal table, and the scents of the exotic plants accompanied the Great King on his paradisiacal promenades!

Chapter 6

Representations of Royalty and Monarchic Ideology

1. Sources and Problems

The Variety of Evidence: Complementary and Specific

Many and varied are the sources available to the historian who would analyze the constituents and the dynamic of the monarchic ideology established (or more rigorously codified) by Darius and maintained in its essence by his successors. The Great King himself often described, and a number of his inscriptions detail, what constituted the ideological justifications for his power in his own opinion, not just in respect to his dominion over subject peoples (as we have presented above), but also in regard to his royal authority. The Great Kings were also frequently represented in reliefs at Persepolis and elsewhere, in monumental sculpture at Susa, and in both cases sometimes with accompanying inscriptions. Kings' images are also found in various forms in other media, particularly coins and seals. All of these elements taken together constitute what may be called official court art. Along with these imperial sources, the presentations of the Classical sources, which have the advantage of situating royal activity in its historical (or historicizing) context, must also be taken into account.

At first glance, we might consider the convergences between these different sources of information to be striking. From an overall comparison of the various corpora, we can offer a view of Achaemenid monarchic ideology that is both analytical and dynamic. Nevertheless, it is a good idea to keep in mind several methodological caveats. First of all, it is sometimes risky to establish a direct connection between iconographic

Fig. 13. Darius and his court as seen in a Greek painting of the fourth century.

depictions and the Classical texts, taking the texts as historiographic commentaries on the reliefs. And even within royal art, we must distinguish the information (1) as a function of the message that the Great King wished to deliver, (2) as a function of the public for whom it was intended, and (3) as a function of the medium (inscriptions, reliefs, seals, etc.).

These distinctions also permit us to reintroduce diachrony into the thematic study. Many iconographic monuments—palaces, reliefs, coins, some seals—are datable and dated (though the dates may be disputed). This does not generally hold for information given by the Classical authors, who most often speak of a generic “king” when discussing a court custom. Most of the Classical sources come from the fourth century (Ctesias, Dinon) and the Hellenistic era (Alexandrine historians), and they aim at analyzing the potential permanence of the ideological systems. When we grant priority to sources specifically dated to the Achaemenid period, we can more clearly recognize what goes back to Darius in the working out and propagation of the monarchic ideology. It will thus be advisable to return to the modifications or adaptations brought about by Darius’s successors (for example, the introduction or transformation of an official religion of Mithra and Anāhita during the time of Artaxerxes II) at the end of this chapter.

Lost Persian Monuments, or Greek Reconstructions for Harried Tourists?

There is an additional obstacle to uncritical use of the Classical sources. In some cases, they give information on royal activities that are not represented in the reliefs. There is of course no doubt that many of the decorative elements of the palace have disappeared, whether enameled bricks (known best from Susa but also found at Persepolis) or metal sheathing applied to the monumental gates, gold or jeweled cladding, or color, which can be discerned only from residual traces. Only recently, for instance, has the first physical evidence of fresco-work been discovered in a palace of Artaxerxes II at Susa and on the walls of an apadana (“great hall”) in Armenia. This leads to the question, should we or should we not presume that the Classical authors provide firsthand information about monuments that have been lost since ancient times? Or better, should we reconstruct lost Achaemenid monuments in the same way that we might attempt to devise a computer-graphics visual recreation of the battle of Marathon, based on the description given by Pausanias? In some cases, the Greek descriptions are not a real problem. It is not hard to accept, for example, that the palaces were provided with bronze gates, as Diodorus (XVII.71.6) and the author of the *De Mundo* (398a) state. Assyrian precedents, fragments found at Persepolis, and Treasury tablets offer substantiation. The same can be said of the Golden Vine found in the Susa Treasury by one of Alexander’s successors. However, among the lost decorative elements, the specific problem of the tapestries must be highlighted. Many Greek authors stress their magnificence. There can hardly be any doubt that in most cases the composition of the woven designs represented the faunal themes so popular in Achaemenid glyptic and goldwork (cf. Aristophanes, *Frogs* 937; Athenaeus XII.538d). For instance, a remarkable illustration is found in a saddlecloth from the Pazyryk kurgan in Siberia, which is understood to be inspired by Achaemenid art.

On the other hand, some statements by Classical authors stimulate critical doubt. According to Plutarch (*Them.* 29.4♦), when Themistocles was granted an official audience with Artaxerxes I, he succeeded in holding the king’s attention in this way:

Themistocles replied, that a man's discourse was like to a rich Persian carpet (*poikila strōmata*), the beautiful figures and patterns of which can only be shown by spreading and extending it out; when it is contracted and folded up, they are obscure and lost; and, therefore, he desired time.

It is tempting to think that Themistocles was making an implicit but clear reference to the tapestries that decorated the audience chamber of the royal palace. Were these carpets illustrated with drawings and symbolic representations of events? The account of Chares of Mytilene, repeated by Athenaeus (XIII.575f♦), immediately comes to mind. Chares, chamberlain to Alexander the Great, recorded an Iranian folktale that told of a romance between Prince Zariadres and Princess Odatis. Chares says:

Now this love affair is held in remembrance among the barbarians who live in Asia and it is extremely popular; in fact they picture (*zōgraphēin*) this story in their temples and palaces (*basileia*) and even in private dwellings; and most princes bestow the name Odatis on their own daughters.

But, however interesting this may be as evidence for methods of diffusion and preservation of Iranian folklore, the account does not bear on the potential existence of historical scenes. On the other hand, according to a later author, Philostratus, the walls of the Parthian palaces in Babylon were also decorated with embroidered tapestries. Along with mythological motifs borrowed from the Greek repertoire, historical scenes were also found:

The tapestries also showed Datis snatching Naxos from the sea, Artaphernes besieging Eretria, and, among the deeds of Xerxes, those wherein he claimed victory. Obviously the occupations of Athens and Thermopylae were included, and scenes still more dear to the Medes, of drained rivers, a bridge across the sea, and the manner in which a canal was cut near Athos. (*Vit. Apoll.* 1.25)

What is this kind of evidence worth? Setting aside its late nature, we may legitimately ask whether the author really did see what he describes or whether his claim is pure creative writing. The repetition of the motif by the author of the *Alexander Romance* (III.28.10) strengthens the observer's doubts. Each of the supposed descriptions repeats passages of Herodotus quite precisely, especially the numerous digressions he devotes to rivers drained (he claims) by Xerxes' armies (VII.21, 53, 58, 108). Many modern-day travelers have come to Persepolis armed with passages from Diodorus of Sicily and other ancient sources and—contrary to all evidence at the site—sworn that they saw exactly what their passion for the Classical authors prepared them to “see”!

The fact that a traveler was an eyewitness does not in itself validate his claims. See the conflicting descriptions of Cyrus's tomb given by the companions of Alexander the Great, used by Strabo (XV.3.7–8♦) and Arrian (*Anab.* VI.29). One (Aristobulus) describes the building as “a small tower . . . concealed within the dense growth the trees”; the other (Onesicritus) “states that the tower had ten stories”; a third, later author (Aristus of Salamis) wrote “that the tower has only two stories and is large”! Ever since antiquity, furthermore, all sorts of nonsense (or fictional recreation) has been proffered on the significance of the Behistun relief (it is virtually inaccessible). According to Diodorus (II.13.2♦), “The lowest part of these she [Semiramis] smoothed off and engraved thereon a likeness a herself with a hundred spearmen at her side” (cf. also Isidore of Charax, *Parthian Stations* §5)! And afterward new interpretations were proposed by Arab geographers and European travelers, each more fantastic than the last.

Of course, there can be no doubt that some artists were inspired by the Persian Wars. We know particularly the extent to which the Athenian artists drew their subjects from them—but this was for the purpose of exalting the memory of the Greek victories! Herodotus, for instance, records the story of the architect Mandrocles of Samos, who was richly paid by Darius for designing the bridge of boats across the Bosphorus.

Mandrocles spent a certain portion of what he received in having a picture painted, showing the whole process of the bridging of the strait, and Darius himself sitting on his throne, with the army crossing over. This picture he presented as a dedicatory offering to the temple of Hera, with the following verses inscribed upon it, to serve as a permanent record of his achievement:

*Goddess, accept this gift from Mandrocles,
Who bridged the Bosphorus' fish-haunted seas.
His labour, praised by King Darius, won
Honour for Samos, for himself a crown. (IV.88–89)*

It is clear that the picture was not ordered by Darius and that it was not intended to decorate the royal palace walls. Indeed, in doing this, Mandrocles was exhibiting a certain amount of sycophancy and thus contributed to the perpetuation of the memory of Darius's heroic actions near the Greeks. But primarily he intended to leave a monument to his own worth in his city, which had already paid him well by awarding him a crown.

In a long digression, Diodorus of Sicily, following Ctesias, took great interest in the mythical queen Semiramis. Describing one of the palaces in Babylon built by the queen, he writes:

On both the towers and the walls there were again animals of every kind, ingeniously executed by the use of colours as well as by the realistic imitation of the several types; and the whole had been made to represent a hunt, complete in every detail, of all sorts of wild animals, and their size was more than four cubits [ca. 2 m]. Among the animals, moreover, Semiramis had also been portrayed, on horseback and in the act of hurling a javelin at a leopard, and nearby was her husband Ninus, in the act of thrusting his spear into a lion at close quarters. . . . [In another palace] were also portrayed both battle-scenes and hunts of every kind, which filled those who gazed thereon with varied emotions of pleasure. (Diodorus II.8.6–7♣)

We know that depictions of the Great King often lie behind these descriptions of Semiramis. But no evidence from Susa, Babylon, or Persepolis provides the slightest confirmation. It is possible that Ctesias or one of his informants was talking about hunting scenes that decorated pre-Achaemenid palaces. However, it must be stressed that in the Assyrian palaces war scenes and hunting scenes were sometimes placed in out-of-the-way chambers. It is thus not out of the question that Ctesias took it upon himself to decorate the Babylonian palaces of Semiramis / the Great King with scenes anyone could see on seals and stamps in particular.

Finally, in the course of telling about the expedition of the Emperor Julian against the Sassanian Persians, Ammianus Marcellinus includes a parallel report:

We halted in rich country lushly planted with fruit trees, vines, and cypress greenery; in the center was found a secluded den, shaded and pleasant, where in each apartment could be seen barbarian paintings showing the king in the act of killing wild beasts in a large hunting party. In fact, these people do not paint or depict any other scenes but massacres and wars of every kind. (XXIV.6.1)

This is also a late text. Study of Sassanid goldwork effectively shows when the hunting theme became part of the monarchic lifestyle. What is more interesting is the countryside described by Ammianus Marcellinus. We are clearly in a paradise, an enchanting place where the king could stop and where hunts were organized in game preserves stocked with wild animals. What the author describes is not a palace in a capital, but a royal residence situated in a paradise. Were these residences decorated with hunting scenes in honor of the king? Possibly. We have no archaeological evidence to confirm the hypothesis. The only information on this point comes from the small courts of Asia Minor, especially Lycia, where the dynasts liked to see portrayals of themselves hunting. But the fact that the artists were partly inspired by the Persians does not necessarily mean that they copied court representations. Perhaps they only imitated and adapted images on seals and impressions.

These preliminary remarks are not intended totally to dismiss the information found in the Classical authors. There is hardly any doubt, for example, that the Greeks of the fifth and fourth centuries knew the splendors of the royal residences. The numerous exchanges between the Greek cities and the Achaemenid court, quite apart from the abundance and richness of the booty, made the Greeks aware of objects symbolic of Persian luxury (garments, vessels, tents, and other things), which upper-class Greeks clearly adopted to their own use. In this, Greek texts and iconography tend to exaggerate the "Achaemenid" corpus but are also careful to separate the source of inspiration from the methods of acquisition and borrowing. On the other hand, we have hardly any information about just what images of the royal palaces might have been available specifically in Greece. The only exceptions are references by Aristotle (*De Mirab.* 39a.15–26) and Athenaeus (XII.541a–b), who refer to a luxurious *himation* ['cloak'] that Dionysius the Elder was supposed to have bought from a wealthy Sybarite: on the edges of the garment Susa and Persepolis were represented, doubtless in very stylized form, after the fashion of the "city reliefs" that are well known from sculpture (especially Assyrian and Lycian). If correct, the information seems to confirm what might otherwise be questionable: the Greeks of the Classical period had information on the Persian royal palaces and court art. It is sometimes thought, in fact, that the Athenians of Pericles' time adapted the Persian style for the Acropolis to emphasize their own imperial dominion. Nonetheless, we must point out that it is not until Alexander's court historians that we have the first written description of Persepolis (Diodorus XVII.70).

Center and Periphery

It is important to distinguish between evidence that derives from the center and evidence that derives from the periphery. The former casts a direct light, springing from the understanding of the Great Kings and their counselors; the latter is more like reinterpretations, which the historian must try to decipher. We thus need to isolate the "provincial" materials, which, though they were clearly inspired by the court art from the center, nonetheless possess distinctive characteristics (the so-called Greco-Persian stamps and stelas from Asia Minor, for example, or Persepolis-like reliefs from Meydançikkale in Cilicia). All of these documents assume tremendous importance for anyone who is trying to understand the diffusion of monarchic themes throughout the Empire. What they mostly inform us about, however, is life in satrapal or dynastic courts and the process of acculturation. They will therefore be considered separately (fig. 13).

Fig. 14. Audience scene from the sarcophagus of Alexander.

We will only consider depictions that are obviously true copies of depictions found at Persepolis. See, for example, the audience scene on one of the bullae from Dascylium (fig. 15) and the scene found on the shield of a warrior on Alexander's sarcophagus (fig. 14); it has been supposed (not implausibly) that the artist had seen the Persepolis reliefs. On the other hand, it would be a good idea to avoid suggesting that every depiction found in provincial artwork is an exact reproduction of now-lost iconography from the center.

The absence of hunting and war scenes at Susa or Persepolis is particularly striking, especially when we take into account the place the Classical texts and the seal impressions grant to these royal activities and when we recall the strong predilection of the Assyrian kings for this kind of representation. But we must resist the temptation to fill in the Achaemenid lacuna using the Classical texts just presented or the "Greco-Persian" stelae and seals. In the final analysis, all of these texts and interpretations falter in the face of the evidence. Aside from the Behistun relief, the Great Kings never depicted themselves as warriors (or hunters) on the walls of their palaces, and even at Behistun the realistic aspect is secondary. It is exactly this predilection that is of greatest importance for the historian. Neither the reliefs nor the inscriptions were meant to describe the daily life of the king or even to portray explicitly each of the elements of the monarchic ideology. Suffice it to remark that there is not a single royal inscription making even the slightest reference to the Great King's ability as a hunter, except in a few apocryphal inscriptions transmitted by the Greek authors—*transmitted* here meaning "reconstructed" from information

Fig. 15. Audience scene on a seal impression from Dascylium.

they had gathered from other media! This observation constrains our method: although we must use the available sources to understand the functioning of Achaemenid monarchic ideology, we must also distinguish the media, in such a way as to better understand the specificity of the message transmitted by the monumental art of Persepolis, Susa, or Naqš-i Rostam.

2. *The Prince in His Own Mirror*

Darius at Naqš-i Rostam

Darius himself is responsible for the richest exposition of the ideological justifications for his authority. He presented them first at Behistun, insisting especially on the privileged protection of Ahura-Mazda, his familial rights, and his stature as conqueror. We

have already emphasized the considerable interest of the Behistun inscription and relief for the reconstruction of Achaemenid monarchic ideology, and we will have frequent occasion to cite it again in the pages to come, to parallel other royal statements.

But in this regard, a different monument takes pride of place—the sculpted façade of the royal tombs at Naqš-i Rostam (fig. 16). The tombs appear practically identical to each other. In the upper register (the top arm of the cruciform elevation), the Great King is shown standing on a three-step platform. His left hand holds a bow, resting on the ground behind his left foot. His right hand is raised toward Ahura-Mazda, represented here (as elsewhere) as a person rising from a winged disk alongside a lunar crescent. Between the king and the god is a flaming altar. The ground is supported by two rows of thirty figures representing the subjugated peoples as bearers of the throne (or the ground of the Empire). To the left, shown one above the other, are the Great King's arms-bearers Gobryas (Gaubaruva) and Aspathines (Aspacānā), each identified by an inscription (*DNc-d*). Other members of the court appear to the right (perhaps as mourners).

Fig. 16. The tomb of Darius at Naqš-i Rostam.

Only Darius's tomb has an inscription, placed behind the king, in several versions. There are three distinct parts. The first (*DNa*) includes an invocation of Ahura-Mazda, "a great god . . . who created this earth, who created yonder sky, who created man, who created happiness for man, who made Darius king [the royal titulature follows]" (§1♦). Then Darius proclaims his dominion over the peoples that he has "seized outside Persia," who "bore tribute to" him, who did what the king ordered them to do: "My law—that held them firm." A country list follows (§2♦). In §3, Darius records his victories achieved with the aid of Ahura-Mazda, and he refers directly to the bearer-peoples, whom the viewer is invited to regard as an attestation of royal power. A final invocation and a prayer to Ahura-Mazda (§5–6♦) follow:

Saith Darius the King: This which has been done, all that by the will of Ahuramazda I did. Ahuramazda bore me aid, until I did the work. Me may Ahuramazda protect from harm, and my royal house, and this land: this I pray of Ahuramazda, this may Ahuramazda give to me! O man, that which is the command of Ahuramazda, let this not seem repugnant to thee; do not leave the right path; do not rise in rebellion!

Another part (*DNb♦*)—which was later repeated in summary by Xerxes (*XPI*)—is clearly remarkable for its style and inspiration. It comprises a sort of catalog of royal virtues and an exposition of the duties of the king and his subjects. It is thus with good reason that it is considered the Prince's Own Mirror:

§7—A great god is Ahuramazda, who created this excellent work which is seen, who created happiness for man, who bestowed wisdom and efficiency on Darius the King.

§8a—Saith Darius the King: By the favor of Ahura-Mazda I am of such a sort that I am a friend to right, I am not a friend to wrong. It is not my desire that the weak man should have wrong done to him by the mighty; nor is that my desire, that the mighty man should have wrong done to him by the weak.

§8b—What is right, that is my desire. I am not a friend to the man who is a Lie-follower. I am not hot-tempered. What things develop in my anger, I hold firmly under control by my thinking power. I am firmly ruling over my own (impulses).

§8c—The man who cooperates, him according to his cooperative action, him thus do I reward. Who does harm, him according to the damage thus I punish. It is not my desire that a man should do harm; nor indeed is that my desire, if he should do harm, he should not be punished.

§8d—What a man says against a man, that does not convince me, until he satisfies the Ordinance of Good Regulations.

§8e—What a man does or performs (for me) according to his (natural) powers, (therewith) I am satisfied, and my pleasure is abundant, and I am well satisfied. [Xerxes: "And I generously repay men of good will."]

§8f—Of such a sort is my understanding and my command: when what has been done by me thou shalt see or hear of, both in the palace and in the war-camp, this is my activity over and above my thinking power and my understanding.

§8g—This indeed is my activity: inasmuch as my body has the strength, as battle-fighter I am a good battle-fighter. Once let there be seen with understanding in the place (of battle), what I see (to be) rebellious, what I see (to be) not (rebellious); both with understanding and with command then am I first to think with action, when I see a rebel as well as when I see a not-(rebel).

§8h Trained am I both with hands and with feet. As a horseman I am a good horseman. As a Bowman I am a good Bowman both afoot and on horseback. As a spearman I am a good spearman both afoot and on horseback.

§8i—And the (physical) skillfulnesses which Ahuramazda has bestowed upon me and I have had the strength to use them—by the favor of Ahuramazda what has been done by me, I have done with these skillfulnesses which Ahuramazda has bestowed upon me.

[§]4a—May Ahura-Mazda protect me and my work: XPI.]

An isolated paragraph is separated from the body of the preceding inscription by a blank space, which was not repeated by Xerxes. In inspiration, it closely resembles the first part (*DNa*). As in *DNa* §6, the king directly addresses a subject (*marika*) who is not specifically identified, who seems to stand metonymically for all of the populations dominated by the Great King. He dictates his behavior to him:

§9a-b—O menial, vigorously make thou known of what sort I am, and of what sort my skillfulnesses, and of what sort my superiority. Let that not seem false to thee, which has been heard by thy ears. That do thou hear, which is communicated to thee. [O menial], let that not be made (to seem) false to thee, which has been done by me. That do thou behold, which [has been inscribed]. Let not the laws [be disobeyed] by thee. Let not [anyone] be untrained [in obedience]. [O menial], let not the king (feel himself obliged to) inflict punishment (?) [for wrong-doing (?) on the swellers (in the land) (?)].

The Victorious King and the King of Justice

The second text (*DNb*) is more revealing about the specific qualities and virtues of the king. They are defined with reference to two spheres of activity, at once distinct and

closely complementary: the palace (*viθ*: or the House) and the battlefield (§8f). Darius is not only a good infantryman and a good horseman, a good archer and a good lancer (§8h), but he is also a good commander-in-chief. If he is able to lead his troops into combat successfully, it is because he possesses particular intellectual qualities: intelligence and a spirit of analysis and decisiveness that free him from the emotion of panic (which any other soldier would be familiar with: §8g) and enable him rapidly to execute the clearest and most effective measures in the heat of battle (§8b.11–13). The king is thus a leader of men.

These statements remind us of many others, such as: "By the favor of Ahuramazda and of me, Darius the King, [this country Persia] does not feel fear of (any) other" (DPd◊). In numerous statements, Darius says that it was at the head of the Persian warriors that he conquered and mastered the peoples of his Empire. He refers to himself when he writes, addressing his subjects, "Then shall it become known to thee: the spear of a Persian man has gone forth far; then shall it become known to thee: a Persian man has delivered battle far indeed from Persia" (DNA §4). Also: "The Persian Man conquered Egypt" (DSab). The ideology of the warrior-king is very well illustrated at Behistun in both text and image. Indeed, "this country Persia which Ahuramazda bestowed upon [him is] good, possessed of good horses, possessed of good men" (DPd◊), and all the Persians are known for their valor, as stressed by Herodotus: "Prowess in fighting, the chief proof of manliness" (I.136◊). Thanks to the protection of his god, the Great King was distinguished from all of the Persian warriors: he was not only a first-class horseman, archer, and lancer, but he also possessed the physical and intellectual qualities that made him a commander-in-chief beyond compare.

The same qualities also make Darius a master of justice. As at Behistun, the king contrasts justice with the Lie (§8b). His capacities for comprehension and judgment allow him to dispense justice with complete equanimity, for he is able to transcend anger (§8b). We may compare this royal statement with what Herodotus writes of the way in which the heads of Persian families and the king himself declared judgments: "Custom . . . forbids even the king himself to put a man to death for a single offence. . . . Their way is to balance faults against services, and then, if the faults are greater and more numerous, anger may take its course" (I.137◊). This is exactly the definition Darius himself provides of justice: he repays whoever "does wrong," This punishes "the Lie-follower" and "who does harm" (§8a–c). This obviously relates to a highly monarchical conception of justice: every man is judged in proportion to the aid and assistance he brings to the king's interests—as Herodotus understood perfectly. But Darius's statements go further. He tries to reconcile the interests of the powerful and the poor (§8a). In his eyes, a poor man may behave as worthily as a rich man (§9b). As well as being defender of the peace against enemy attack, Darius is also guarantor and restorer of civil peace (cf. DSe 001). If the king can behave in this way, it is because of "regarding himself as divinely appointed for a law to the Persians, and the supreme arbitrator of good and evil" (Plutarch, *Art.* 23.5◊).

Text and Image

Many Achaemenid objects illustrate Darius's statements in pictures. At Behistun and Naqš-i Rostam, Darius holds his bow in his left hand; at Behistun it rests on his left foot, which crushes Gaumata to the ground. The king is also represented as an archer on the royal coinage. In the various designs, he has the bow in his left hand and arrows in his

Fig. 17. Royal Coinage.

right, or sometimes a quiver on his shoulder, or he is kneeling to draw the bow; sometimes he has a lance on the right and the bow on the left, or even, on the run, he has the bow in his extended left hand while drawing an arrow with his right hand from the quiver on his shoulder (fig. 17). It seems clear that this figure is not a specific king, but the king in general.

The contest won by Smerdis in Egypt is indicative of the importance of the bow as an attribute of sovereignty (III.30). Does not Aeschylus call Darius the royal archer? At Naqš-i Rostam the noble Gobryas is Darius's lance-bearer (*arštibara*), while another noble, Aspathines, is the bearer of the bow (*vaçabara*) and the king's battle-axe (*DNe-d*). The bow is expressly listed by the Classical authors as one of the "insignias of royal power," perhaps received by the Great King during the enthronement ceremony.

The theme "victorious king" and the representation in the Behistun style of the people who are conquered is found on several seals (fig. 18). On one of them (attributed to Artaxerxes III), the king, with a lance upright in his right hand and quiver on his shoulder, holds a rope in his left hand that binds the neck of three conquered people (*SA^{3b}*).

Fig. 18. The King, the Persians, and war.

The text says, "I am Artaxerxes the Great King" (fig. 18c). Another seal, also from Egypt, shows a Persian king, his left hand grasping an Egyptian with an Egyptian hairdo (*pschent*), whom he thrusts through with his lance while holding four prisoners with a rope around their necks (fig. 18a–b); the motif of captives held by a rope is repeated on a seal on the Treasury tablets (PTS no. 28). Perhaps the Artaxerxes seal was meant to commemorate Artaxerxes I's victory over the rebel Inarus. The important thing is to note the persistence of the theme of lionizing the Great King as a hero. The theme of conqueror-king is found on several seals: on one of them, a royal Persian kills a Saka, whom he holds by his pointed hat; a nearly identical scene is found on a cylinder seal from the Oxus treasury (Dalton no. 114, pl. XVI); on another, a king thrusts his lance through a Greek

Fig. 19. The statue of Darius discovered at Susa.

warrior, who kneels before him immobilized by the king's left hand (fig. 18e). An image of the warrior king was already represented on the seal of Kuraš of Anšan (fig. 18d); it is also found on the seal of Aršāma, satrap of Egypt (fig. 18f). All of these representations are clearly intended to spread the image of a king endowed with all of the virtues of a fine warrior, just as this fact is expressed in words by Darius at Naqš-i Rostam and Behistun.

3. The King in Majesty

The Statue of Darius

One of the most meaningful objects is the statue of Darius discovered at Susa in 1972 (fig. 19). It was placed on the gate on which construction began under Darius but which was only finished under Xerxes (fig. 38, p. 260). This gate, which dominates the plain at some 15 m high, gave visitors access to the Royal City on their way to the Apadana and the other palaces (fig. 9, p. 167; fig. 19). Probably, two identical statues were originally placed right and left, facing the interior. This is the first known example of Achaemenid monumental statuary; only the head is missing. Although it was carved in Egypt and is characterized both by its origin and its initial installation at Heliopolis, the statue represents the king in a way that is very similar to representations at Persepolis. The king holds a short staff in his right hand and a (lotus) flower in his left. Only the robe looks different, since it has neither decoration nor color.

In fact, in every royal depiction, from Darius I to Artaxerxes I, the king wears the same robe with identical decoration (concentric circles, a row of striding lions). The costume

of "Cyrus" is described by Xenophon (*Cyr.* VIII.3.13♦): "A purple tunic shot with white (none but the king may wear such a one), trousers (*anaxyrides*) of scarlet dye about his legs, and a mantle (*kandys*) all of purple." Quintus Curtius features the same choice of colors in describing Darius III's robe:

The attire of the king was noteworthy beyond all else in luxury; a purple-edged tunic woven about a white centre, a cloak of cloth of gold, ornamented with golden hawks, which seemed to attack each other with their beaks; from a golden belt, with which he was girt woman-fashion, he had hung a scimitar (*akinakēs*), the scabbard of which was a single gem. The Persians called the king's head-dress (*regium capitis insigne*) *kidaris*; this was bound with a blue fillet variegated with white. (III.3.17♦)

Some ornaments do not appear on the Persepolis reliefs. It is not impossible that fashion changed over time (cf. III.3.5). However, the colors noted at Persepolis are also found in this description. The choice of colors was certainly deliberate: in the Indo-Iranian traditions, white, red, and blue corresponded to the three categories of the social fabric, the priests (white), soldiers (red), and farmers (blue).

There is no reason to suppose that the Susa statue was unique in royal Achaemenid art. We know from Herodotus (III.88♦) that, upon his accession, Darius's "first act was to erect a stone monument with a carving of a man on horseback, and the following inscription: Darius, son of Hystaspes, by the virtue of his horse and of his groom *Oebares*, won the throne of Persia. The horse's name was included." Whatever the legitimate doubts concerning the exact content of the inscription, the existence of this sort of relief cannot be ruled out. The craze for equestrian statues among the Persians is attested in a well-known Aramaic document, in which the satrap Aršāma orders the sculptor Hinzanāy, then in Egypt, to "execute a sculpture of a horse with its rider, corresponding to that which he previously executed for me, and other sculptures" (DAE 70 [AD 9♦]). We also learn from Diodorus of Sicily (XVII.17.6♦) that Ariobarzanes, "a former satrap of Phrygia," placed his statue in the temple of Athena Ilias. There is thus no difficulty in postulating that other royal statues were found at other sites, including Persepolis (Quintus Curtius V.6.5). Furthermore, Plutarch records that after the sacking of the city one could still see "a large statue of Xerxes" (Alex. 37.5♦).

Iconography from Persepolis

The king is also shown in numerous reliefs at Persepolis in conventional poses that are often reflected on the two sides of an entrance, as in a mirror.

He is seated on his throne (supported, as at Naq̄-i Rostam, by the throne-bearers). He is sometimes accompanied by another royal figure, who is usually considered to be the crown prince, standing behind him. The king's feet rest on a footstool, and he has his long scepter in his right hand, with its end on the ground in front of the footstool (east gate of the Tripylon: Schmidt, pls. 77–78; fig. 21 here). On other reliefs, the king is shown without the prince; the only figure behind him is a servant holding a parasol over the king with his right hand and a towel in his left (Throne Room: Schmidt, pls. 104–5).

Always seated on his throne in the same pose and holding a lotus flower in his left hand, the Great King is found under a canopy decorated with a lion frieze (surrounding an image of Ahura-Mazda) and friezes of rosettes (fig. 20). Outside of the canopy, guards fill out the scene, two on each side. The royal throne and footstool are placed on a dais. Behind the king, the crown prince stands on the dais, also holding a lotus flower in his

left hand, extending his right hand toward his father's throne. Directly in front of the king are two footed censers and a high court official bending toward the sovereign with his right hand to his mouth and a short staff in his left. Behind the crown prince we see two people: a servant holds a towel in his right hand, with his left hand on his right arm; the other probably represents the royal arms-bearer (battle-axe in his right hand, bow and *gōrytos* ['quiver'] on his left shoulder). This was the subject of the reliefs in the Treasury that were originally placed in the middle of the façade of the north portico of the Apadana (Schmidt, pls. 119–21). The crown prince is not found on later reliefs (four audience scenes on the east and west gates of the Hall of a Hundred Columns [or Throne Room] started by Xerxes and built by Artaxerxes I; pls. 96–97); immediately behind the throne is the parasol-holder (fig. 22).

There are also several cases where the king is shown walking, followed by two servants (fig. 23), one holding the parasol over the royal head, the other a towel folded over his forearm (Tripylon: Schmidt, pls. 75–76; Darius's palace: pls. 138–41; Xerxes' palace: pls. 178–84; "Harem": pls. 193–94); a scene showing the king accompanied by his parasol-bearer is also found on a stamp published by Speleers (1917, no. 708; also showing a lion and a trident stuck in the ground).

Finally, on many reliefs a royal figure is depicted confronting real or imaginary animals (lions, bulls; monster with a horned lion's head or bird's head). Most often, the different kinds of combat are depicted side by side as if they constitute the elements of a single iconographic discourse (fig. 24). In general, the combatant grasps the animal's mane (or horns) with his left hand while plunging the sword in his right hand into the belly of the beast (Schmidt, pls. 114–17, 144–46, 195–97). Less commonly, the royal figure smotheres a lion with his left arm: his left hand holds a lotus blossom, his right hand a dagger with which he is about to kill the lion (pl. 147, Darius's palace).

It appears that these depictions, taken as a whole, are intended to give an image of the king as at once calm, sovereign, and triumphant. Other motifs in these scenes accord with this view (rows of guards and throne-bearers). Add to these the rows of nobles (fig. 25) and the very idea of an Empire united around the Great King is exalted. Furthermore, the various depictions must not be confused in a too-simple analysis. We may

isolate the last category, which is traditionally called "Royal Hero" (fig. 24). In fact, even if the other three representations (figs. 21–23) do not constitute "photographs" (so to speak) of court life, they are no less testimonies to the protocol governing the Great King's court—an aspect absent from the figure of "Royal Hero."

The King on His Throne

The commentary on the first three registers emerges from the images themselves and from details of court life gleaned from the Classical authors. They are intended primarily to express the idea that the king is a man above other men. Each of these reliefs is topped by the disk of Ahura-Mazda. The king himself is shown in a fixed pose, somewhat hieratic. The servants accompanying him are there to relieve him of all of the physical discomforts resulting from the excessive heat (parasol, towel). Only the heir in the audience reliefs is placed on the dais that supports the royal throne. The joint presence of the king and his son further accentuates the immutable character of kingship.

The king is also characterized by material attributes that are his alone. When he is seated on his throne, his feet rest on a footstool. This recalls what Dinon wrote (*apud* Athenaeus XII.514a◊):

Whenever the king descended from his chariot, Dinon says, he never leaped down, although the distance to the ground was short, nor did he lean on anyone's arms; rather, a golden stool (*diphros*) was always set in place for him, and he descended by stepping on this; and the king's stool-bearer (*diphrophoros*) attended him for this purpose.

The bearer of the royal footstool is represented on the façades of the east and north wings of the Apadana. The footstool itself was well known to the Classical authors, because it was included in the booty seized by the Athenians after the battle of Plataea. According to the Alexandrian tales, this footstool was also used to assist the king in stepping up: when Alexander mounted the royal throne, his feet "dangled in the empty air," to use Quintus Curtius's picturesque and evocative phrase (V.2.13–15). In this way, the king avoided subverting the majesty that needed to be his in whatever pose he assumed. We also know that within the palace the distribution of rooms was such that the king

Fig. 25. Rows of Persian and Median nobles.

was the only one who could use certain corridors or tread on the Sardinian carpets reserved for him (Athenaeus XII.514c).

The Royal Audience

The king is also shown seated on his throne in the audience reliefs. Many Classical authors took interest in the audience ritual, leaving the uncertain impression that the official in Mede's clothing who comes bowing before the Great King is none other than the chiliarch, a Greek word translating Iranian *hazarapatiš* (Commander of a Thousand). He was the head of the Great King's personal guard (metonymically represented by the soldiers placed to the right and left of the relief). He was the one who received the petitions of all of those who sought an audience with the king: "Without him, none could gain audience" (Nepos Conon 3.2–3; cf. Plutarch, *Them.* 27.2–7). He was the one "who took messages in to the king and presented petitioners" (Aelian, *VH* I.21♦) or passing on their messages to the king if they were not admitted to his presence.

The Classical authors insist that it was necessary to perform a *proskynesis* ['obesance'] before the sovereign in order to obtain an audience. This, for example, is what was clearly prescribed for Themistocles by the chiliarch Artabanus:

Amongst our many excellent laws, we account this the most excellent, to honour the king, and to worship him (*proskynein*), as the image of the great preserver (*eikón theou*) of the universe; if, then, you shall consent to our laws, and fall down before the king and worship him, you may both see him and speak to him; but if your mind be otherwise, you must make use of others to intercede for you, for it is not the national custom here for the king to give audience to any one that doth not fall down before him. (*Them.* 27.4–5♦)

The chiliarch Tithraustes addresses Conon in the same words: any man brought before the king must "render to the king a rite of adoration (*venerari*)." Nepos adds, parenthetically, "what in that country is called *proskynesis*" (Conon 3.3). It was the same for Ismenias, who was also received by the chiliarch Tithraustes (Aelian, *VH* I.21). These three stories probably go back to a common model by which the Greeks expressed what had become for them a motif illustrating Persian despotism, often also recalled in connection with the satraps and Alexander.

A comparison of the Classical texts and the reliefs nonetheless presents an interpretive problem. Exactly what act must be performed by the person granted audience? In other words, what does the word *proskynesis* mean? In the audience reliefs, the important person in front of the king bends forward and blows a kiss. But in many of the Greek authors, it very clearly refers to an act—also familiar in the pre-Achaemenid Near East and with the Parthians—consisting of falling prone or to one's knees before the royal throne. This is also what Herodotus describes when reporting social differences among the Persians:

When Persians meet in the streets one can always tell by the mode of greeting whether or not they are of the same rank; for they do not speak but kiss—their equals upon the mouth, those somewhat superior on the cheeks. A man of greatly inferior rank prostrates himself in profound reverence (*prospiptōn proskynei ton heteron*). (I.134♦)

Although the term *proskynesis* implies a kiss, it cannot be reduced to only a kiss. Hence Ismenias's ruse:

Entering and coming into full view of the king, he surreptitiously took off the ring he happened to be wearing and let it fall at his feet. Looking down quickly he bent to pick it up, as

Fig. 26. The royal chariot at Persepolis.

if he were performing the act of homage (*proskynesis*). This gave the Persian king the impression of obeisance (*proskynesis*), but he had not done anything that causes Greeks a feeling of shame. (Aelian, VH I.31♦)

This text allows two interpretations. On the model of other Greek tales, it can be taken to imply that *proskynesis* required falling to the ground. On the other hand, it may be taken to imply that bending forward sufficed (since Ismenias did not fall to his knees to recover the ring). A passage in Herodotus preserves this ambiguity (VII.136♦). Introduced before Xerxes, the Spartans Sperchias and Bulis refused to perform the required act despite being so ordered by the guards: They “declared that they would never do such a thing, even though the guards should push their heads down on to the floor. It was not, they said, the custom in Sparta to worship a mere man like themselves, and it was not for that purpose that they had come to Persia.” In Greek eyes, *proskynesis* was reserved for the gods.

Whatever the details, there is no doubt about the general meaning of the ceremony: performing *proskynesis* recognized the majesty of the sovereign (cf. Xenophon, *Anab.* 1.8.21; [Aristotle] *De Mundo* 398a). The act could be performed outside of the physical presence of the king. We see the satrap Datames make *proskynesis* before a letter he had just received from Artaxerxes II (Polyaenus VII.21.5). But, contrary to what the Greeks deduced from it, the rite did not imply that the king was considered a god.

Royal Horses and Chariots

One of the processions depicted at Persepolis (south wing of the Apadana) is headed by an usher, followed by guards, a bearer of the royal footstool, and squires who bear whips and finely worked saddlecloths. Other squires (on the north wing) lead stallions. They are followed by two highly decorated chariots, each drawn by two horses guided by charioteers holding the reins (fig. 26). These are doubtless some of the famous Nisaeon horses found in Xerxes’ procession and described by Herodotus in this way:

Then came ten of the sacred horses, known as Nisaeon, in magnificent harness, . . . followed by the holy chariot of Zeus drawn by eight white horses. . . . Then came the king himself, riding in a chariot drawn by Nisaeon horses, his charioteer, Patiramphes, son of Otanes the Persian, standing by his side. (VII.40♦)

Fig. 27a–b. The Royal Hero.

This chariot is the two-wheeled war and parade chariot (*harma*), clearly distinguished by every ancient author from the four-wheeled travel carriage (*harmamaxa*). This is the kind of chariot in which Xenophon presents Cyrus to the crowd during the parade at Persepolis. “Cyrus’s private stud of horses, with gold bits, about two hundred in all, led along with gold-mounted bridles and covered over with gold-embroidered housings,” were also part of the parade (Cyr. VIII.3.14–16◊). Wherever the king relocated, he was in fact accompanied by horses from the royal stable, who were quartered near the royal tent (Herodotus IX.70), 400 of them according to Quintus Curtius (III.3.21).

Xenophon stresses the strong impression made by Cyrus, standing in his chariot: “And when they saw him, they all prostrated themselves before him (made *proskynesis*), either because some had been instructed to begin this act of homage, or because they were overcome by the splendour of his presence, or because Cyrus appeared so great and so goodly to look upon” (VIII.3.14◊). Many other texts attest to the majesty assumed by the king on his chariot. That is how he is shown in the celebrated *Mosaic of Naples* (fig. 28 on p. 229). On the verge of the Macedonian victory it commemorates, “the king himself, in extreme peril, caught up the reins, being forced to throw away the dignity of his position and to violate the ancient custom of the Persian kings” (Diodorus XVII.34.6◊). From his chariot, in fact, the king “rode outstanding among the rest” (Quintus Curtius III.3.15◊); Darius III “had entered battle standing high in his chariot” (IV.1.1◊); and to his immediate relations, he stated: “I myself, not only because it is my country’s custom, but also that I may be seen of all, ride in a chariot” (IV.14.26◊). All of these texts very clearly express the fact that strict rules governed the movements of the king, all of which were designed to further enhance his stature.

The royal horses and chariot thus do not appear in the Persepolis reliefs simply for decoration. The royal chariot obviously carried ideological weight: the chariot was part of the ‘royal insignia’ (*insignia imperii*). For this reason, opprobrium was cast on Darius

III in Macedonian propaganda: he had abandoned his chariot to facilitate what the ancient authors called his shameful flight (Quintus Curtius III.11.12). At Gaugamela, the royal coachman was killed by a lance but, "standing as he was high in his chariot, [Darius] blushed to abandon the battle-line of his subjects" (IV.15.30♦). In the end, he took flight. For the second time, Alexander was able to capture Darius's shield, bow, arrows, and chariot (Arrian III.15.5).

The Royal Hero

One of the most frequent themes on seals as well as on the Persepolis reliefs is the Royal Hero fighting real or monstrous animals; the Hero, in the middle, generally holds an animal in each hand (fig. 27b). The placement of these figures on the doorjambs seems to indicate that the king was an apotropaic figure, protecting his palace and his realm (*viθ*) in this way. In contrast to the figures in the seal representations, the main figure at Persepolis does not bear the familiar symbols of the king (robe, crown). Perhaps this is a personification of the victorious Persian Man to whom Darius alludes several times in his inscriptions. But identification with the king is simple and obvious: in a way, it is a variation on the theme of the victorious king.

4. The Good Warrior

A Tall and Handsome King

The Classical sources themselves also abound with notes on the exceptional physical prowess of the Great Kings. For Strabo (XV.3.21♦), Darius I was "the most handsome of men, except for the length of his arms, for they reached even to his knees"! Herodotus paints a no less flattering portrait of Xerxes: "Amongst all these immense numbers there was not a man who, for stature and noble bearing, was more worthy than Xerxes to wield so vast a power" (VII.187♦). As for Artaxerxes, "surnamed the Long-handed, his right hand being longer than his left" (Plutarch, *Art.* 1.1♦), "he owed his chief renown to his imposing appearance and his physical beauty, with which he coupled extraordinary military courage, since of all the Persians he was the one who was personally most worthy" (Nepos, *Reges* 21.4). Darius III was "the tallest and handsomest man of his time" (Plutarch, *Alex.* 21.6♦). Hence the familiar anecdote recorded by Diodorus (XVII.37.5) and Quintus Curtius (III.12.16–17♦): Darius's mother and wife were taken prisoner after the battle of Issus and brought to Alexander's tent, where Haephestion was also present. "Of the same age as the king, he nevertheless excelled him in bodily stature. Hence the queens, thinking that he was the king, did obeisance to him in their native fashion."

The theme is especially prominent during periods of dynastic competition among the various candidates for royal power. As we noted above, this was the background for the anecdote contrasting Cambyses and Smerdis in Egypt, the latter being the only one who could bend the bow sent by the Ethiopian king. The theme would be revived with special vigor in the time of Artaxerxes II and Darius III. All of the texts testify that physical appeal and bravery in combat constituted potent justifications for royal power. This is probably the tradition (widespread in any event) referred to in Strabo's remark: "This, too, is a Medes custom—to choose the bravest man as king; not, however, among all Medes, but only among the mountaineers" (XI.13.11♦). These are obviously *a posteriori* justifications: a man did not become king because he was handsome or a battle-hardened lancer; it was because of his position as king that a man was automatically

designated handsome and courageous. If we are to believe Plutarch, the king's physical characteristics were even elevated to the rank of models to be emulated: "The Persians, because Cyrus was hook-nosed, even to this day love hook-nosed men and consider them the most handsome" (*Mor.* 821e◊).

Court artists and officials received strict orders to disseminate the image of a king who was imposing in height and beauty. According to Plato (*Alc.* 121d◊), the eunuchs entrusted with the bodily care of the royal children "attend to all the needs of the infant child, and are especially concerned to make him as handsome as possible, shaping and straightening his infant limbs; and for this they are held in great esteem"! Pliny probably obtained the following information from the same source: "To give to the body the charming appearance," the Persian *magi* and kings coated themselves with an ointment, apparently somewhat unsavory, made from the flowers of a Cilician plant (*helianthes* 'sunflower') steeped in lion fat, saffron, and palm wine (*XXIV.*165◊). On all of the reliefs, the king is routinely made taller than the other persons. This is particularly obvious at Behistun, but it is also clear in the audience reliefs where, additionally, the king and the crown prince standing behind him are placed on a dais.

Xenophon does not conceal the existence of ruses intended for the physical exaltation of the king. When, during the parade at Persepolis, Cyrus "appeared so great and so goodly to look upon," it was not just because of the special splendor of his garments: "With him rode a charioteer, who was tall, but neither in reality nor in appearance so tall as he; at all events, Cyrus looked much taller" (*Cyr.* VIII.3.13–14◊). Again according to Xenophon, Cyrus also gave this sort of instruction to his closest companions:

We think, furthermore, that we have observed in Cyrus that he held the opinion that a ruler ought to excel his subjects not only in point of being actually better than they, but that he ought also to cast a sort of spell upon them. At any rate, he chose to wear the Median dress himself and persuaded his associates also to adopt it; for he thought that if any one had any personal defect that dress would help to conceal it, and that it made the wearer look very tall and very handsome. For they have shoes of such a form that without being detected the wearer can easily put something into the soles so as to make him look taller than he is. He encouraged also the fashion of pencilling the eyes, that they might seem more lustrous than they are, and of using cosmetics to make the complexion look better than their nature made it. He trained his associates also not to spit or to wipe the nose in public, and not to turn round and look at anything, as being men who wondered at nothing. All this he thought contributed, in some measure, to their appearing to their subjects men who could not lightly be despised. (*VIII.*1.40–42◊)

Furthermore, nobles wearing hairpieces appear several times at Persepolis, and this attests to the regular use of fake beards and moustaches. Strabo also mentions hair as a taxable item (*XV.*3.21). A financial stratagem recorded by Pseudo-Aristotle (*II.*14d◊) illustrates this practice: Condalus, a governor under Mausolus, "noticing that the Lycians were fond of wearing their hair long, said that a dispatch had come from the king of Persia ordering him to send hair to make false fringes and that he was therefore commanded by Mausolus to cut off their hair." Ctesias knew the story of a eunuch who supposedly conspired against Darius II: "He had a woman fashion a beard and moustache to make him look like a man" (§53). And here is how Xenophon describes the official appearance of Astyages: "Pencilings beneath his eyes, with rouge rubbed on his face, and with a wig of false hair" (*Cyr.* I.3.2◊; cf. *VIII.*1.41). He also mentions the existence of "beauty-doctors who pencil their eyes and rouge their cheeks for them and otherwise

beautify them” in the suites of Persian nobles (VIII.8.20⇨). At Persepolis itself, two reliefs show a servant with a (cosmetic) flask in his right hand and a folded towel in the left (Schmidt pls. 148A–149).

The Commander-in-Chief: Representations and Realities

The most important royal personas for Darius were warrior and commander-in-chief. On this point, the testimony of Classical authors is contradictory, however. For instance, as Xenophon puts it, victory is one of the justifications of kingship (*Anab.* I.7.9; I.8.12). But more often the Greeks highlight the reluctance of the kings to place themselves at the head of their armies, such as Artaxerxes III in Diodorus: He, “himself unwarlike, remained inactive. . . . Though regarded with contempt by the Egyptians, he was compelled to be patient because of his own inertia and peace-loving nature” until the moment when “he became enraged and decided to make war upon the insurgents” (XVI.40.4–5⇨). Xerxes had a well-publicized reputation for cowardice among his adversaries. So did Darius III, who was guilty of abandoning his chariot and royal insignia (*kandys* and bow) at Issus and Gaugamela.

The judgment of the Classical authors is obviously shaped by a Greek polemical current that resulted in a presentation of the barbarians in general and the Great Kings in particular as weak and worthless men. However, this perspective also is supported by propaganda that issued from opponents at the court during periods of dynastic struggle. This is the framework that explains the strongly divergent images of Artaxerxes II, who is sometimes called a coward (in Cyrus the Younger’s propaganda) and sometimes an extraordinary leader of men (in the royal propaganda). The same images and distortions are found in the two versions of the accession of Darius III (chap. 17/1). The very existence of these conflicting versions, moreover, confirms the importance of the warrior function in Achaemenid monarchic ideology.

But the Greek polemical current does not explain everything. While the interpretation found in the Classical authors does in fact reveal Greek assumptions, the avoidance of battle by the Great Kings is confirmed by many examples. Let us note at the outset that only one of all the Achaemenid kings, Cyrus, was lost in a military campaign. It has still not been established whether he was killed in battle. The others died of ill health (Cambyses, Darius, Artaxerxes I, Darius II, Artaxerxes II) or at an assassin’s hand (Bardiya, Xerxes I, Xerxes II, Sogdianus, Artaxerxes III, Artaxerxes IV, Darius III). We may also note that during the Greek campaign Xerxes never took part in combat. At Thermopylae, he watched the fighting from his throne (Herodotus VII.212) and at Salamis he followed the battle from the sidelines (VIII.90; Aeschylus, *Persians* 465–67); at the battle of Cunaxa, Artaxerxes soon retired to a nearby hill (Plutarch, *Art.* 11.3, following Ctesias). Even when the king took part in the fighting, he was placed in a spot traditionally assigned to him, in the middle of his forces. Xenophon (who reports that it was the same when encamped: *Cyr.* VIII.3.8–11) does not conceal the fact that this choice was intended to protect the king’s life: “For they think that this is the safest position, namely, with their forces on either side of them, and also that if they want to pass along an order, the army will get it in half the time” (*Anab.* I.8.22⇨). Similarly Darius III at Issus: “Darius himself held the centre of his whole host, the customary (*nomos*) position for Persian kings” (Arrian II.8.11⇨); according to Nicolaus of Damascus, Cyrus made the same choice at a battle with Astyages: “He stayed in the center with the distinguished Persians” (FGrH 90 F66.34). It is also clear that great pains were taken to ensure that the

king would be able to leave the battlefield safe and sound if things did not go well. Fear of falling into Alexander's hands at Issus found Darius "mounted upon a horse which followed for that very purpose" (Quintus Curtius III.11.11♦; cf. Aelian, *Anim.* VI.48).

The political character of the custom cannot be doubted. Several times, the ancient authors describe discussions about this at the Achaemenid court. According to Herodotus, Artabanus, who had already tried to dissuade Darius from campaigning against the Scythians (IV.83), used the same argument with Xerxes when he was preparing to head the army against the Greeks: he did not think it a good idea to imperil "all the king's affairs" (VII.10). Diodorus, in his tale of the battle of Thermopylae, mentions that the Greeks captured the royal tent and then remarks: "If the king had remained at the royal pavilion, he also could easily have been slain by the Greeks and the whole war would have reached a speedy conclusion" (XI.10.3♦). According to Ctesias (§32), Artaxerxes was similarly dissuaded by his associates from heading the army preparing to march against Egypt. According to Diodorus and Quintus Curtius (III.2.10–19), the same debate unfurled around Darius III after the news of the death of Memnon [Artaxerxes II]:

Some said that the king must join in battle personally, and they argued that the Persians would fight better in that event. Charidemus, however, the Athenian, . . . recommended that Darius should on no account stake his throne rashly on a gamble, but should keep in his own hands the reserve strength and the control of Asia while sending to the war a general who had given proof of his ability. (Diodorus XVII.30.2♦)

The ancient authors recount similar discussions in the camps of Cyrus the Younger and Artaxerxes before the battle of Cunaxa (Plutarch, *Art.* 7.3, 8.2).

The exaltation of the fighting abilities of the Great King is thus purely ideological in nature and does not imply that the sovereign exaggerated his acts of valor on the battlefield. During the rare wars in which he did participate, he manifested his abilities less as an elite warrior than as "a good battle fighter . . . first to think with action," to quote Darius himself at Naq̄-i Rostam (*DNb* §8g♦). At this point, we may note that Plutarch (*Mor.* 172f♦) records that, in delivering his own testimonial, Darius stated "that in battles and in the face of formidable dangers he became more cool and collected." The performance of Artaxerxes II in the course of a campaign against the Cadusians was exalted in court propaganda in exactly this way:

With his quiver by his side and his shield on his arm, he led them on foot, quitting his horse, through craggy and steep ways, insomuch that the sight of his cheerfulness and unwearied strength gave wings to the soldiers, and so lightened the journey that they made daily marches of above two hundred furlongs. (Plutarch, *Art.* 24.10–11♦)

Moreover, through his privileged relationship with the deities, whose frequent sacrifices he continued to observe during his expeditions (chap. 6/6 below), he solicited their protection for his army. Finally, heading the army also enabled the king to visit his subjects during the course of one of those peregrinations that brought the court from one end of the Empire to the other (chap. 5/4). For a king who had newly assumed power, it was also a way to assert his authority.

Darius III in Battle: An Agonistic Perspective on Royalty

There is one item that places the Great King on the scene during a battle. This is the famous *Mosaic of Naples*, in which Darius III is standing in his chariot, surrounded by his protective guard, and directly confronts Alexander, who charges on his horse, lance

Fig. 28. Darius III in battle.

in hand (fig. 28). There is in fact a tradition that it took the personal confrontation of the two kings to decide the outcome of the battle. In the reply Alexander issued to his adversary at Marathon, the Macedonian threw down a serious challenge: "If you claim the kingship, stand your ground and fight for it (*agōnīσαι peri autēs*) and do not flee, as I shall pursue you wherever you are" (Arrian II.14.9♦). The choice of agonistic vocabulary is obviously not innocent. The historian Polybius found this tradition worthless (XII.22.1–7). He quotes Callisthenes, who accompanied Alexander: "Alexander arranged his forces in such a way as to invite personal combat with Darius, who originally had the same intent toward Alexander." According to Chares of Mytilene, the single combat did take place at Issus: "In this battle he was wounded in the thigh, Chares says, by Darius, with whom he fought hand to hand" (Plutarch, *Alex.* 20.8♦). This is the tradition illustrated by the creator of the original scene.

The tradition of the combat of chieftains is well attested among the Greeks and Macedonians, as well as the Persians and Iranians. For example, we know the suggestion of the commander of Persian-Iranian troops in Aria, Satibarzanes, for deciding the outcome of a battle in which none of the adversaries seemed able to prevail: "He challenged to battle anyone who wished to fight in single combat" (Quintus Curtius VII.4.33♦). Erigyus the Macedonian took up the challenge, and the combat (*monomakhia*) took place in an open area between the two armies; Satibarzanes was struck and killed, after which his troops surrendered to the Macedonians (cf. Diodorus XVII.83.5; Arrian III.28.2–3). The theme is also found in Darius III's royal propaganda. One of the versions claims that he owed his throne to his exceptional military valor, which he had proved by his victory in single combat against a Cadusian chieftain (Diodorus XVII.6.1–2; Justin X.3.2–5; perhaps to be compared with Strabo XI.13.11).

Lastly, we may stress the obvious similarities between Callisthenes' and Chares' version of the battle of Issus and what is recorded by several ancient authors about the battle of Cunaxa, where in 401 the legitimate Great King (Artaxerxes II) confronted his brother Cyrus, who claimed superior rights. Although Clearchus had advised against personal combat and had entreated him not to expose himself in this way, Cyrus felt that he must not show himself "unworthy of empire" (Plutarch, *Art.* 8.2♦). Just like Alexander and Darius at Issus, Cyrus and Artaxerxes, "who disputed the kingship (*hyper tēs basileias agōnizomenoi*), were placed at the center of the array. Thus in full view, they fell on each other, eager to decide the outcome of the battle for themselves. Fortune seemed to have reduced the war between the brothers to a single combat (*monomakhia*), comparable to that of Eteocles and Polynice sung by the tragic poets" (Diodorus XIV.23.5).

The texts under consideration primarily express a Greek and/or Macedonian perspective. Note that Diodorus refers explicitly to a Greek custom when he refers to the single combat (*monomakhia*) of Eteocles and Polyneices. We also know that the tradition of single combat was known in Macedonia at the dawn of the Hellenistic era (cf. Athenaeus IV.155a). The documentation thus gives expression to the Greek vision of Persian royal power, but it also transmits a Persian vision known from the court tales that set the Great King to grappling with one of his competitors. As Polybius understood perfectly, court tales deal with the realm of ideological representation and do not report the concrete realities of the battles of Issus and Cunaxa, divergent accounts of which continued to flourish. Actually, the court traditions confirm the central importance of warrior ability in the process of legitimation of royal authority. Whenever two aspirants came into confrontation, the quarrel could not be settled until an individual duel affirmed the aspirations of the winner.

The Hunter-King

The hunt was another occasion when the Great King could demonstrate his bravery. Out of all of Cyrus the Younger's qualifications for kingship, the ones that to Xenophon justified his aspirations the most were his abilities in combat ("military accomplishments, alike the use of the bow and of the javelin") and his love of the hunt: "He was the fondest of hunting and, more than that, the fondest of incurring danger in his pursuit of wild animals" (*Anab.* 1.9.5–6♦; cf. *Cyr.* 1.3.15; 1.4.7–15). Achaemenid inscriptions and iconography are mute on this point, as has already been explained (see 6/1 above). However, texts from the high Hellenistic period can be used. One recurrent theme is that the king himself killed innumerable wild beasts. Quintus Curtius attributes to Alexander alone (*ille*) a kill of 4,000 wild animals (VIII.1.19). This is a theme well known from Assyrian inscriptions as well: Aššurnasīrpal II boasts of killing no less than 450 great lions and 390 wild bulls with his own hands, and cutting off the heads of 200 ostriches and 20 great lions (ANET: 558–60)! Alexander's successors did not fail to take up this theme in turn. Lysimachus was reputed to have killed a lion "of remarkable size" (VIII.1.15♦) with his own hands. An even better story circulated:

Perdiccas the Macedonian who accompanied Alexander on his mission was apparently so courageous that he once went alone into a cave where a lioness had her lair. He did not catch the lioness, but he emerged carrying the cubs. Perdiccas won admiration for this feat. Not only Greeks, but barbarians as well, are convinced that the lioness is an animal of great bravery and very difficult to contend with. They say that the Assyrian Semiramis had her

spirits raised, not if she killed a lion or leopard or another animal of that kind, but if she captured a lioness. (Aelian, *VH* XII.39♦)

The story clearly originated in circles close to Perdiccas. But it is also very clearly set in a Near Eastern ideological context, as is shown by the reference to barbarians and Semiramis. A legend of Lysimachus portrays him overpowering "a most ferocious lion, by seizing his tongue and smothering him in that way" (Justin XV.3.7-8). Indeed, this motif is also common in the Assyrian period: in one of his inscriptions, Aššurnasirpal II boasts of seizing a lion once "by the ears" and another time "by the tail," and this is how the royal artists showed him.

According to protocol, certain prerogatives were reserved for the king. On many occasions Xenophon's Cyrus participates in hunts, particularly at Astyages' court. On one occasion, Cyrus reminds him that it is his right to cast the first spear (*Cyr.* I.4.14). The existence of this protocol at the Persian court is confirmed by Plutarch (*Mor.* 173d). The story of Megabyzus offers a perfect illustration of this court custom:

Artaxerxes (I) went hunting and a lion attacked him. As soon as the beast leapt, Megabyzus struck him with a javelin and brought him down. The king was angry because Megabyzus had struck the beast before he could touch it himself; he ordered Megabyzus's head cut off. (Ctesias §40)

In doing this, Megabyzus had not just violated the rules of protocol. It is important to state that the scene unfolded during a lion hunt; numerous documents indicate that lion hunts were a special privilege of the king. In other words, Megabyzus had cast doubt on Artaxerxes' abilities as a hunter and thus also his qualification to be king.

This particularly pregnant theme appears again in an account of one of Alexander's hunts:

When a lion of extraordinary size rushed to attack the king himself, it happened that Lysimachus, who was afterwards a king, being beside Alexander, began to oppose his hunting spear to the animal; but the king pushed him aside and ordered him to retire, adding that a lion could be killed by himself alone as well as by Lysimachus. And in fact Lysimachus, once when they were hunting in Syria, had indeed alone killed a lion of remarkable size, but had had his left shoulder torn to the bone and thus had come into great peril of his life. The king, taunting him with this very experience, acted more vigorously than he spoke; for he not only met the wild beast, but killed him with a single wound. (Quintus Curtius VIII.1.14-16♦)

During royal hunts, then, courtiers had to be circumspect. While someone who came to the aid of the king could be richly rewarded (Diodorus XV.10.3: Tiribazus; cf. Xenophon, *Anab.* I.9.6; Polybius, *Frag.* 38), the example of Megabyzus indicates that it was not a good idea to appear to be a rival.

No hunting scenes are found in any of the palace reliefs, but they do appear in innumerable seals and seal impressions (fig. 29). The king is sometimes shown hunting from his chariot, as on Darius's cylinder seal (*SDa*) or as described in episodes narrated by Diodorus (XV.10.3) and by Polybius (*Frag.* 133). But, let us not fool ourselves; an image such as Darius in a chariot confronting an enormous lion (fig. 29a) belongs primarily to the repertory of monarchic ideology. These are not realistic, narrative scenes. Usually, the king hunts on horseback (cf. Aelian, *VH* VI.14), like all the young Persians: "They hunt by throwing spears from horseback, and with bows and slings" (Strabo XV.3.18♦). Herodotus mentions that during a hunting party Darius, jumping his horse quickly,

Fig. 29a–b. Hunt scenes on seals; above (29a), seal of Darius, showing the king hunting a lion; below (29b), inscribed seal, depicting a “Mede” hunting a wild boar.

suffered a severe sprain (III.129). Nevertheless, it was in the hunt as in war that the king proved his exceptional courage and valor. For this reason, the other participants were either completely unknown or else left in the shadows by the court artists.

It must be stressed that in some seals the theme of hunter-king is confused with the theme of Royal Hero. Even when the king confronts lions, the scene is far from realistic. For example, on one seal, the king is perched on a camel and brandishes his lance at a lion rearing up at him on his hind legs (Frankfort 1939, XXXVII, m). The lion is in the same posture on another seal where the king, on foot and armed with a bow, faces the beast (XXXVII h). Nor does the famous seal of Darius constitute a “photograph” of a royal hunt: standing on his chariot, the king launches an arrow toward an immense lion, rearing on its hind feet, while another lion (somewhat miniaturized) lies under the hooves of the horses, already felled by the royal arrow (SDa, fig. 29a). What is more, on some impressions the hunter-king confronts a monster identical to those found at Persepolis. For example, the king, in his chariot, armed with his bow, faces a hybrid winged and horned being (apparently a griffin), also rearing on its hind legs (Frankfort XXXVII, n).

5. The King, the Earth, and the Water

The Good Gardener

The elite warrior Great King could also engage in agricultural work and influence the prosperity of the fields. Xenophon develops this theme with particular insistence in

the *Oeconomicus*. In order to make his addressee (Critobulos) better understand the combined importance of war and agriculture, Socrates (fictitious mouthpiece of Xenophon) gives the example of the king of the Persians:

Need we be ashamed of imitating the king of the Persians? For they say that he pays close attention to husbandry and the art of war, holding that these are two of the noblest and most necessary pursuits. (IV.4♦)

Then Xenophon returns indefatigably to this point: "As for the country, he personally examines so much of it as he sees in the course of his progress through it." The mission entrusted to the governors was to ensure "that their country is densely populated and that the land is in cultivation and well stocked with the trees of the district and crops" (IV.8♦). In the shape of a specific illustration of a general policy, Xenophon is careful to include a reference to the paradises:

"Yet further," continues Socrates, "in all the districts he resides in and visits he takes care that there are (*kēpoi*) 'paradises,' as they call them, full of all the good and beautiful things that the soil will produce, and in this he himself spends most of his time, except when the season precludes it."

"By Zeus," says Critobulos,

"Then it is of course necessary, Socrates, to take care that these paradises in which the king spends his time shall contain a fine stock of trees and all other beautiful things that the soil produces." (IV.13–14♦)

Elsewhere, Xenophon also states that his Cyrus ordered each of his satraps to establish paradises (*Cyr.* VIII.6.12). In fact, the Classical texts, Babylonian tablets, and also a few tablets from Persepolis show that there was at least one paradise in each satrapy. Among other examples, we may cite Plutarch's description of the paradise of the satrap Tissaphernes at Sardis, "the most beautiful of his parks, containing salubrious streams and meadows, where he had built pavilions, and paces of retirement royally and exquisitely adorned" (Plutarch, *Alc.* 24.7♦). The paradise at Dascylium was known to the Greeks for its fertility and charm (Xenophon, *Hell.* IV.1.15–17). These qualities are depicted on several impressions and seals found at the site. Quintus Curtius wrote this about a paradise near Ecbatana: "The residences in that region have extensive, charming, and secluded parks with groves artificially planted; these were the special delight of both kings and satraps" (VII.2.22♦). However, the paradises were not just hunting preserves; the preserves were only one constituent.

When Socrates was trying to convince Critobulos that Cyrus the Younger "would have proved an excellent ruler" (*Oec.* IV.18♦), he cited several sources in support of this assessment, including a description of Lysander's visit to Cyrus the Younger's paradise at Sardis:

"Lysander admired the beauty of the trees in it, the accuracy of the spacing, the straightness of the rows, the regularity of the angles and the multitude of the sweet scents that clung round them as they walked; and for wonder of these things he cried, 'Cyrus, I really do admire all these lovely things, but I am far more impressed with your agent's skill in measuring and arranging everything so exactly.' Cyrus was delighted to hear this and said: 'Well, Lysander, the whole of the measurement and arrangement is my own work, and I did some of the planting myself.' 'What, Cyrus?' exclaimed Lysander, looking at him, and marking the beauty and perfume of his robes, and the splendour of the necklaces (*ta strepta*) and bangles (*pselia*) and other jewels that he was wearing; 'did you really plant part of this with your own hands?' 'Does that surprise you, Lysander?' asked Cyrus in reply. 'I swear by the

Sun-god that I never yet sat down to dinner when in sound health, without first working hard at some task of war or agriculture, or exerting myself somehow." (IV.20–25♠)

There is no doubt that Xenophon's narratives came from a version that sang the praises of Cyrus the Younger's royal qualities and that the link between the Great King and agriculture was thus one of the constituent elements of Achaemenid royal ideology. By systematically underscoring the brutal contrast between the verdure of the paradise and the barrenness of its surroundings, the Classical authors—without being fully aware of it—participated in the exaltation of a sovereign powerful enough to create prosperity and vegetation in the face of unfavorable natural conditions.

But in the passage above, Xenophon—the only Classical author to preserve this *topos*—brings in another characteristic feature: the king himself planted trees. This is not a Hellenizing invention of the author. We may cite a parallel passage from the book of Esther, which records the organization of a feast by Ahasuerus (Xerxes) in his palace at Susa; the author places the festival "in the enclosure adjoining the king's palace" (1:5♠). The Vulgate says: "in the vestibule of the garden and the woods, which had been planted by the royal hands with a magnificence worthy of them" (*horti et nemoris quod regio cultu et manu consitum erat*). More importantly, two iconographic testimonies confirm and illustrate the theme of gardener-king. A cylinder seal from the Achaemenid era shows a Persian using his long staff to guide a pair of oxen with humps drawing a plow. An almost identical scene is found on a coin from Tarsus in Cilicia: the work scene is shown on the obverse, surmounted by a winged disk, with the reverse showing a cow suckling a calf. There is scarcely any doubt that in both cases it is the king himself being shown as a gardener.

Xerxes and the Plane (or Sycamore) Tree

Other texts attest to a special relationship between the Great King and flora. In the course of his story of Xerxes' march between Phrygia and Sardis, Herodotus states concisely, "it was hereabouts that he came across a plane tree of such beauty that he was moved to decorate it (*dōrēsamenos*) with golden ornaments (*kosmos chryseos*) and to leave behind one of his Immortals to guard it" (VII.31♠). The story was clearly very popular among the Greeks; another version has it that during Xerxes' passage through Phrygia (on his return from Europe) a plane (sycamore) tree metamorphosed miraculously into an olive tree (Pliny, *NH* XVII.42). In his *Variae Historiae*, Aelian returns twice to the anecdote:

The famous king Xerxes was ridiculous (*geloios*), if it is true that he despised sea and land, the handiwork of Zeus, manufacturing for himself novel roads and abnormal sea route, and yet was the devotee (*dedoulōto*) of a plane tree, which he admired. In Lydia, they say, he saw a large specimen of a plane tree, and stopped for that day without any need. He made the wilderness around the tree his camp (*stathmos*), and attached to it expensive ornaments, paying homage to the branches with necklaces (*strepta*) and bracelets (*pselia*). He left a caretaker (*meledōn*) for it, like a guard (*phylakē*) to provide security (*phrouros*), as if it were a woman he loved. What benefit accrued to the tree as a result? The ornaments it had acquired, which were quite inappropriate to it, hung on it without serving any purpose and made no contribution to its appearance, since the beauty of a tree consists of fine branches, abundant leaves, a sturdy trunk, deep roots, movement in the wind, shadow spreading all around, change in accordance with the passing of seasons, with irrigation channels to support it and rain water to sustain it. Xerxes' robes (*chlamydes*), barbarian gold, and the other offerings (*dōra*) did not ennoble the plane or any other tree. (II.14♠)

Aelian judges royal behavior just as severely and condescendingly elsewhere. He includes it among other examples of love “ridiculous (*geloioi*) and bizarre (*paradoxoi*),” for the same reasons as the passion avowed by a young Athenian for a statue of *Tychē* or attachments between humans and animals (IX.39↔). This assessment (no trace of it is found in Herodotus) comes from the negative

vision of Xerxes transmitted by all of the Greek authors who—following the model of their inspiration, Aelian—denounced the immoderation (*hybris*) of a man who did not shrink from affronting the laws of man and god by throwing a bridge across the sea. The same assumption of balance and moderation led Aelian to exalt the laws of nature that did not permit unnatural loves between humans and nonhumans, or personal, emotional relationships between a man and a tree: the growth of vegetation is permitted (or forbidden) by the natural elements (waters, winds, seasons) and by the labor of the peasants (irrigation canals); the personal intervention even of a king as powerful as Xerxes is as nothing in the face of the immutable constraints of nature.

In view of this, it is clear that Aelian understood nothing of the court history that he read, perhaps in Herodotus himself, and that he embellished with a moralizing commentary suitable for reaching his Greek readers. If his account is read back into Persian and Iranian mindsets, it provides another attestation of the special relationship between the king and the vegetable kingdom. The gifts to the plane tree are of exactly the same kind as the gifts that the king presented to his Faithful and his Benefactors (bracelets, necklaces, robes)—that is, to the men who deserved to be recognized for their loyalty and devotion to the Royal House and to the person of the king (chapter 8/1). The Lydian plane tree was thenceforth as richly decorated as the Immortal whom Xerxes appointed as its guard and whose jewelry Quintus Curtius described as follows: “They are especially the ones whom a barbarian luxury of opulence rendered the most imposing: for them gold necklaces, for them robes embroidered with gold and sleeved tunics, also adorned with gems” (III.3.13). But these are also the jewelry worn by the king himself, as Xenophon recalls, stressing that the ornaments did not impede Cyrus the Younger from planting trees.

There can hardly be any doubt that this episode echoes the existence of a tree cult. Several seals convey similar scenes. One of them (inscribed with the name of Xerxes) shows a person dressed and coiffed like a Persian king about to place a crown in front of a stylized tree of life (SXe; fig. 30). One of the Persepolis seals is particularly interesting. Two guards (similar to the guards shown at Susa and Persepolis) stand at attention, lances upright in front of them, on either side of a palm tree, the winged disk surmounting the scene (PTS no. 24). We are immediately reminded of the Immortals assigned to guard Xerxes’ plane tree!

The Plane (Sycamore) Tree and the Golden Vine of the Great King

The stories told by Herodotus and Aelian were embellished by the decorative elements (now lost) that enhanced the opulence of the Great King’s palace. Herodotus records that during Darius’s passage through Asia Minor in 513, the fantastically wealthy Lydian Pythius visited the royal entourage and offered the Great King “the golden plane-

Fig. 30. Seal of Xerxes.

Fig. 31. The Assyrian king with the "Tree of Life."

tree and the golden vine" (VII.27♠). The existence of these arboriform decorations was also well known to the Greeks. The Arcadian Antiochus made this derisive reference when he returned from an embassy to the Great King in 367: "He thought that the King's wealth of money was also mere pretence, for he said that even the golden plane tree, that was forever harped upon, was not large enough to afford shade for a grasshopper" (Xenophon, *Hell.* VII.1.38♠). When Antigonus the One-Eyed inventoried the Treasury in the Susa citadel in 316, "he found in it the golden climbing vine and a great number of other objects of art, weighing all told fifteen thousand talents" (Diodorus XIX.48.6♠).

The reports of Hellenistic authors transcribed by Athenaeus are more precise. Among the testimonies to the luxury of the Great King is Chares of Mytilene, who specifically mentions that "in the bed-chamber a golden vine, jewel-studded, extended over the bed," and Amyntas states "that this vine had clusters composed of the costliest jewels" (XII.514f♠). Phylarcus wrote:

The famous plane-trees of gold, even the golden vine under which the Persian kings often sat and held court, with its clusters of green crystals and rubies from India and other gems of every description, exceedingly costly though they were, appeared to be of less worth . . . than the expense lavished daily on all occasions at Alexander's court. (XII.539d♠)

Achaemenid palaces were probably the model for the decoration of the palace of the Mauryan king at Pataliputra: "His palace has gilded columns: over all of these runs a vine carved in gold, and silver figures of birds, in the sight of which they take the greatest pleasure, adorn the structure" (Quintus Curtius VIII.8.26♠). We are immediately reminded of the famous Assyrian banquet under the arbor (fig. 32). There is no doubt that in the Near East (and in many other parts of the ancient world) the vine was recognized and hailed as a symbol of fecundity, and its increase was considered a gauge of power. A good illustration is found in the dream that Herodotus says the Median king Astyages had shortly after his daughter Mandane's marriage to the Persian Cambyses:

Fig. 32. Aššurbanipal and the vine-arbor.

It was that a vine grew from his daughter's private parts and spread over Asia. . . . He told the interpreters about this dream, and then sent for his daughter, who was now pregnant. When she arrived, he kept her under strict watch, intending to make away with the child; for the fact was that the Magi had interpreted the dream to mean that his daughter's son would usurp his throne. (I. 108◊)

Such were the favorable auspices under which Cyrus was born. The vine that grew from Mandane's private parts was obviously nothing other than the guarantee of an uncommon destiny for the child and reports of conquests extending across all Asia. This is precisely what the Median king understood: "This dream announced the greatness [of the child about to be born] and presaged to Astyages the end of his crown." Hence the attempts to banish the baby and the happy outcome of the founder legend.

Artaxerxes II in the Paradise

In the Achaemenid ideological context, we have two other testimonies that are particularly evocative of relations between the Great King and arboreal flora. In the *Life of Artaxerxes*, Plutarch tells of the difficulties encountered by the king and his army after their return from an expedition against the Cadusians. The army suffered from so many shortages that the chefs were unable to prepare the royal dinner (24.3). Then Plutarch includes the following anecdote:

After they had arrived at one of his own mansions (*stathmos basilikos*), which had beautiful ornamented parks in the midst of a region naked and without trees, the weather being very cold, he gave full commission to his soldiers to provide themselves with wood by cutting down any, without exception, even the pine and cypress. And when they hesitated and were for sparing them, being large and goodly trees, he, taking up an axe himself, felled the greatest and most beautiful of them. After which his men used their hatchets, and piling up many fires, passed away the night at their ease. (§25.1◊)

It is clear that this passage is part of a discussion of the royal virtues of Artaxerxes II, whose physical stamina and bravery Plutarch wished to stress, as well as his abilities as a leader (§24.9–11). The connection between the king and the foliage was so well known to the soldiers that they did not dare to raise their axes against the trees, despite the king's authorization. This confirms the role of the king as the trees' protector. A paradise had to remain "undisturbed," that is, free from the ravages of war (Quintus Curtius

VIII.1.13♦; cf. Polybius XXXI.29). The felling of trees in the paradise was considered an affront to the sovereignty and majesty of the Great King. It is quite striking that, according to Diodorus of Sicily (XVI.41.5♦), the first hostile act of the revolt by the Phoenicians against Artaxerxes III was “the cutting down and destroying of the royal park in which the Persian Kings were wont to take their recreation.” Similarly, under the guise of reprisals, Cyrus the Younger ravaged the paradise of the satrap Belesys, who had sided with Artaxerxes II (Xenophon, *Anab.* I.4.2), and the Spartan king Agesilaus “ravaged the orchards and the paradise of Tissaphernes” near Sardis (Diodorus XIV.80.2).

Let us also stress that, as in Aelian’s version and in many other texts, Plutarch accents the contrast between the aridity of the surrounding countryside and the flamboyant fecundity of the paradise. Of the various tree species, Plutarch also seems to accord special value to pines and cypresses, because these species could only grow in these regions through acclimatization accompanied by intensive care, obviously on the initiative of the royal administration. Strabo, explaining the difficulties that Alexander encountered in 325–324 in procuring wood in Babylonia, states that Babylonia suffered “a scarcity of timber,” so much so that Alexander had to sacrifice “the cypress trees in the groves and the parks” (XVI.1.11♦). At Persepolis itself, many reliefs are punctuated by rows of pines (or cypresses).

Clearchus's Tomb

The story of Clearchus, Cyrus the Younger’s closest Greek associate, whose abilities as commander-in-chief Xenophon vaunts at length (*Anab.* II.3.11–13; 6.1–15), may also be mentioned in this connection. Shortly after the battle of Cunaxa, Clearchus and other Greek generals fell into the hands of the satrap Tissaphernes (II.5.31–32). Despite the claims of Xenophon (II.5.38), Clearchus was not put to death immediately but was imprisoned, according to Ctesias. Ctesias then established a relationship with the general. Ctesias was undoubtedly following instructions from Cyrus the Younger’s mother, Parysatis, who thus once more exhibited her desire to honor the memory of her favorite son. Contrary to Parysatis’s wishes, however, Artaxerxes gave in to the repeated importunings of his wife, Stateira, and Clearchus was executed (Plutarch, *Art.* 18.4; Ctesias, *Persica* §60). At this point, Ctesias describes the divine signs that accompanied the burial of Clearchus:

An extraordinary sight (*teras*) appeared around his body. In fact, spontaneously (*automatōs*), a very high mound rose over his corpse with the breath of a great wind. (§60)

Citing Ctesias, Plutarch records the event with even more detail than Photius, adding an important detail:

As for the remains of Clearchus, that a violent gust of wind, bearing before it a vast heap of earth, raised a mound to cover his body, upon which, after a short time, some dates having fallen there, a beautiful grove (*alsos*) of trees grew up and overshadowed the place. (§18.7♦)

Plutarch obviously considers Ctesias’s information worthless and makes the accusation that “this part of his history is a sort of funeral exhibition in honour of Clearchus.” He also points out that if the trees did grow that way, it was not *automatōs* (spontaneously) but because “dates had fallen there.” Plutarch’s doubts are certainly well founded. But Ctesias did not give these details simply because of his loyalty to Sparta (Clearchus was a Spartan), for which Plutarch denounces him elsewhere (§13.7). It is clear that Ctesias passed on a version that originated in the circle of Parysatis, who once again was trying

to enhance the memory of Cyrus by dramatizing a faithful lieutenant's extraordinary destiny. Ctesias even contrasts Clearchus's fate with the fate of other Greek generals, "who were torn apart by dogs and birds" (§7). This detail clearly refers to funerary customs known in eastern Iran and in the *Avesta* (which is more recent), which forbade underground burial and anticipated that animals and birds would strip the flesh from corpses (chapter 2/9). We thus find ourselves in a Persian and Iranian religious context. The punchline of Ctesias's story, as repeated by Plutarch, confirms this: when Artaxerxes saw the luxuriant grove that later graced Clearchus's tomb, he "declared his sorrow, concluding that in Clearchus he put to death a man beloved of the gods" (*theois philos*; §18.8♦). In other words, the propaganda released by Parysatis's supporters repeated, on behalf of Clearchus, the royal ideological theme that we are considering: because of the king's privileged relationship with the deities who guarantee prosperity, he was honored by vegetation that thrived without human intervention (*automatōs*). The gods themselves created a paradise in the form of a sacred grove (*alsos*) whose foliage overshadowed a tumulus located in an arid region. Through Clearchus, therefore, as Ctesias wrote, "a sign [was] sent by the gods (*teras*)" that came to provide a striking posthumous confirmation of the royal attributes that Cyrus the Younger liked to claim.

The Rainmaker and Master of the Storm

Royal power was manifested even more directly in the cycles of nature. The clearest reference to this is Polyaeus's discussion of Darius's 519 expedition against the Saka of Central Asia (VII.11.12). Due to the treachery of the Sakian Sirakes, the guide, the Great King's army found itself in an absolutely barren region with neither water nor food supplies, where neither bird nor any other beast could be seen. Salvation came from Darius himself:

He climbed a very high hill, and after fixing his scepter in the ground, he placed his tiara and the royal diadem on top of his royal robe (*kandys*). This was at sunrise. He prayed to Apollo to save the Persians and to send them water from heaven. The god listened, and abundant rain fell.

The story told by Polyaeus is obviously Persian in origin. Details in it are attested elsewhere: the sacred location (a mountain), the time (sunrise), the interlocutor (the king), the prayers and worship regularly rendered by the Persians to the forces of nature ("They also worship the sun, moon, and earth, fire, water, winds"; Herodotus I.131♦). Furthermore, to mask his evil intent and subterfuge, Sirakes did not hesitate to "call the eternal Fire and the sacred Water to witness" in Darius's presence.

Only the god is unnamed. Polyaeus mentions Apollo, who frequently stands for Mithra in Greek sources. Nonetheless, in this context Polyaeus's Apollo seems to designate a deity specifically connected with rain. Perhaps it was Tištryā, the deity to whom *Yasht* 8 of the *Avesta* was dedicated and who was closely linked to Mithra in Iranian tradition. He was the liberator of the waters and was the deity to whom prayers for rain were addressed, particularly in the hot season. However, Polyaeus's text perfectly expresses the king's role as intercessor between gods and men. Darius strips off all of the attributes of royalty: the royal robe, scepter, tiara, and diadem. It is the scepter stuck in the ground that causes the rain. By granting his prayer, the god confirms and exalts the exceptional position of the king. The story, which the author places in an Iranian-speaking country, is built on a series of motifs that highlight the king's privileged relation with the deities

and the power that he drew from his intimacy with the gods who govern the elements of nature.

Ctesias presents further evidence of the cosmic power of the Great King, preserved in Photius's summary. Among all of the marvels he reports about India, Ctesias mentions a "fountain that is filled every year with liquid gold":

He also talks about the iron found at the bottom of the fountain. Ctesias claimed to have had two swords made from this metal: one was a gift from the king, the other a gift from the king's [Artaxerxes II] mother Parysatis. Regarding this iron he says that if it is thrust into the ground, it deflects thick clouds, hail, and storms. He claims that the king did this twice in his sight. (*Indica* §4)

The two texts have at least one element in common. In order to bring down rain or divert storms, the Great Kings had to drive a royal symbol (scepter, sword) into the ground as an apotropaic ritual.

At one point, the texts of Polyaeus and Ctesias remind us of what Herodotus writes about certain religious customs of the Scythians. He recalls that, based on the model of the Persians, the Scythians do not erect cult statues, altars, or temples to their gods, except for Ares (IV.59), to whom the various Scythian tribes dedicate a sanctuary, a sort of platform with its height limited to the height of a tall heap of firewood. And Herodotus adds: "On the top of it is planted an ancient iron sword (*akinakēs*), which serves for the image of Ares. Annual sacrifices of horses and other cattle are made to this sword" (IV.62♦). Ares, in this case, is both the god of war and the god of storm.

The relationship between the Great King and the storm is also attested in the founder legends. In Nicolaus of Damascus's version, the first encounters between Astyages' Medes and Cyrus's Persians took place in Persia, near Pasargadae, and turned to the disadvantage of the latter, who were soon besieged on a mountain. Cyrus then made his way to the his parents' goatherds' house and made a sacrifice in the courtyard:

On a base of cypress and laurel trunks he sacrificed barley flour, and he started the fire by friction, in the manner of a poor man with no equipment. Soon, from the right, came lightning and thunder: Cyrus did obeisance [*proskynesis*]. Then, landing on the house, birds (of prey) of good augury appeared, whereupon Cyrus departed for Pasargadae. Then they organized a great meal and stationed themselves on the mountain. The next day, made confident by these birds, they descended toward the enemies at the same time the enemies were ascending toward the summit, and they fought long, vigorously, and courageously. (*FGrH* 90 F66 [41])

To renew the courage of his troops, then, it appears that Cyrus prayed to the storm-god, who legitimated Cyrus's ability as commander-in-chief by manifesting himself to all.

Finally, let us mention the legend of the origin of Mithradates. Plutarch records that a storm broke over his cradle when he was a newborn. The baby's swaddling clothes were burned by a thunderbolt, but the child was safe and sound, though he was left with an indelible mark on his forehead from the lightning (Plutarch, *Quaest. Conv.* I.6.2 [Mor. 624a]). This divine sign in itself qualified him to be king.

6. Between Men and Gods

Royal Prayers

Each of the preceding discussions has illuminated one of the most powerful ideological foundations of the Achaemenid monarchy, namely the union and collaboration of

the Great King and the gods. Darius states that he obtained his royal power from Ahura-Mazda; he owed his victories and his authority over conquered (or rebellious) peoples to his protection. Contrary to the opinion of some Greek authors, the king himself was never considered a god; but neither was he an ordinary man. By virtue of the specific attributes he received from the gods, he was a man above men. Royal protocol served in perpetuity as a reminder of this (cf. chap. 7). He was situated at the intersection between the world below and the divine world, which communicated through his intercession. Ahura-Mazda was in fact "the greatest of the gods, who created heaven and earth and men, who bestowed all prosperity/happiness/serenity (*šiyāti*) on the men who lived there, who created Darius to be king and bestowed on Darius royalty over this vast land" (DPg). After that, the king was the obligatory intercessor between the world of humanity and the world of gods. In this function, Darius addressed Ahura-Mazda to beg him to protect the king, his House, his father Hystaspes, and the crown prince and to provide peace and prosperity to the Persian people, as in this Persepolis inscription (DPd \diamond):

May Ahuramazda bear me aid, with the gods of the royal house; and may Ahuramazda protect this country from a (hostile) army, from famine, from the Lie! Upon this country may there not come an army (*hainā*), nor famine (*dušiyara*), nor the Lie (*drauga*); this I pray as a boon from Ahuramazda together with the gods of the royal house. This boon may Ahuramazda together with the gods of the royal house give to me!

Here Darius implores Ahura-Mazda "with the gods of the royal house" to protect Persia from both external aggression ("army") and revolt ("Lie"), both of them leading to the wasting away of the fields ("famine"). Here in a nutshell are the royal virtues: the good fighter (who gives chase to an enemy army), a king of justice (who fights the Lie), a protector of the land and its peasants (who is the source of prosperity for the fields).

At this point we must emphasize that, according to Herodotus, one of the rules that governed the Persian sacrifices was: "The actual worshipper is not permitted to pray for any personal or private blessing, but only for the king and for the general good of the community, of which he is himself a part" (I.132 \diamond). This sentence primarily expresses the sense that one belonged to an ethno-cultural community symbolized by its gods. The king no doubt was part of the community; in this expression we also find Darius's insistence on his close and privileged union with his people-country (*dahyu*). But Herodotus's report of this detail attests to another reality—that personal religion itself was invested with the power of the royal majesty, since each Persian had to invoke the gods' blessing and protection on the king whenever he offered sacrifices.

Official Religion

Every royal proclamation attests to the existence of official religious practices in which the king played a central role (cf. *Cyr.* VIII.1.23–26). Xenophon dedicates a long passage to the gods and the sacrifices with which Cyrus honored them (*Cyr.* VIII.3.11–24), and he states that the king's last stay in Persia was his seventh (VIII.7.1 \diamond), implying that "the customary sacrifice" was regular. There is in fact no doubt that the Great Kings returned periodically to Persia and that their presence was marked by religious festivals, the ceremony and scheduling of which were probably regulated by custom in an official religious calendar. This is probably what Ctesias is saying when he describes the end of Darius's life as follows: "Darius, having returned to Persia, made sacrifices" (*Persica* §19). This refers to sacrifices and festivals in honor of the gods that Xerxes celebrated

when he was preparing to enter Europe; he invoked the “gods who have our country in their keeping” (Herodotus VII.53♦; cf. Cyr. II.1.1). These gods obviously included “Ahura-Mazda and the other gods” and also quite a few others, such as the Earth, in whose honor Cyrus made sacrifices (Cyr. VIII.3.24).

The diversity of sects observed in Persia is also well documented in two categories of Persepolis tablets (E and K1) that were briefly mentioned above (p. 88). Babylonian and Elamite gods were worshiped alongside Iranian deities, and their attendants were remunerated by the royal administration. In addition to Ahura-Mazda (see below), we have evidence for the worship of Zurvan (Weather), Visai Bagā (a collective divine entity honored in a nonspecific way), Mizdušī (goddess related to fertility and power), Nar-yasanga (related to Fire worship), Brtakāmya (a god unknown elsewhere), Hvarita (Spirit of the Rising Sun), Ārtca (not included in Persian traditions). Most of the time, the rations delivered to the attendants by the administration were intended for sacrifices in honor of several deities. From this we may conclude that each locality had several sanctuaries. Since the tablets were intended primarily to manage the deliveries of products from the warehouses, they give very few details about the ceremonies themselves. The deity's name is frequently absent. For example, an attendant might receive grain or sheep “for the gods” (e.g., PF 353, 356–65, etc.). A record of the attendants, administrator, and location sufficed for the accountants. The terms describing the sacrifices remain difficult to interpret.

Moreover, the documentation from Persepolis attests to the frequency of sacrifices in honor of the forces of nature, especially mountains and rivers, but also hamlets. For instance:

5.7 *marriš* of wine, at the disposal (*kurmin*) of Ušaya, Turkama (?) the priest received, and used them for the gods: 7 QΛ for [the god] Ahura-Mazda, 2 *marriš* for [the god] Humban, 1 *marriš* for the river Huputiš, 1 *marriš* for the river Rannakara, 1 *marriš* for the river Šaušānuš. (PF 339)

Here we again find agreement with the Classical sources. Herodotus particularly stresses the respect that Persians showed for running water: “They have a profound reverence for rivers: they will never pollute a river with urine or spittle, or even wash their hands in one, or allow anyone else to do so” (I.138♦). We have already mentioned that the Sakian Sirakes refers to Sacred Water. Strabo himself notes that the Persians performed a ceremony that specially honored Water and Fire (XV.3.14).

In addition to performing regular sacrifices, the king was the intermediary with the gods during military expeditions. Xenophon constantly refers to this in the *Cyropaedia*. As the head of the Persian army, “Now as soon as [Cyrus] was chosen, his first act was to consult the gods; and not till he had sacrificed and the omens were propitious did he proceed to choose his two hundred men” (I.5.6♦), telling them: “This, moreover, will, I think, strengthen your confidence: I have not neglected the gods as we embark upon this expedition. For you . . . know that not only in great things but also in small I always try to begin with the approval of the gods” (I.5.14♦). They arrived at the border, and “when an eagle appeared upon their right and flew on ahead of them, they prayed to the gods and heroes who watch over the land of Persia to conduct them on with grace and favour, and then proceeded to cross the frontier” (II.1.1♦). Cyrus never failed to ask the gods for favorable signs (III.3.21–22, 57; VI.3.1; VI.4.12; VII.1.1) or to thank them after a victory (IV.1.2).

The description of Xerxes' expedition in 480 swarms with references to religious and magical practices. Among many possible examples, we may select the rite carried out in Phrygia. To punish Pythius for refusing to send his son to war, Xerxes made the following decision:

Xerxes at once gave orders that the men to whom such duties fell should find Pythius' eldest son and cut him in half and put the two halves one on each side of the road, for the army to march out between them. The order was performed.

And now between the halves of the young man's body the advance of the army began. (Herodotus VII.39◊)

This "barbaric" custom was found among many peoples and took on magical-religious force. In Herodotus's version, a solar eclipse had stricken the king with terror a little earlier (VII.37). Despite the soothing explanations of the *magi*, the king opted to proceed with a purification of the army, following the practices described by Herodotus. "This measure boded well for the expedition," as le Comte de Gobineau put it. In this way, the evil was left behind, blocked and repulsed by virtue of sacrifice. When a human victim was chosen (in preference to an animal), it was because the matter was serious. It was actually the fate of the army, and thus of the expedition and the king, that hung in the balance.

As Xenophon's Cyrus put it (I.5.14), the king and the army were accompanied by Persian gods, a fact that is also reflected in the descriptions by Herodotus (of Xerxes) and Quintus Curtius (of Darius III). In the official procession, the chariots of the great gods held a preeminent place. Thus, before Gaugamela, Darius called "upon the Sun and Mithras, and the sacred and eternal fire, to inspire [the soldiers] with a courage worthy of their ancient glory and the records of their forefathers" (Quintus Curtius IV.13.12◊), and he addressed his own gods by invoking "the gods of our fatherland, by the eternal fire which is carried before me on altars, by the radiance of the sun whose rising is within the confines of my realm" (IV.14.24◊). "Nothing sways the common herd more effectively than superstition," Quintus Curtius comments aphoristically (IV.10.7◊). In truth, when we know the close connection between royal legitimacy, victory, and divine protection, we understand that the sacral *aura* of the king could well have heightened the courage of the soldiers at his side.

One of the best pieces of concrete evidence of the official religion appears in a passage from the *Mithradatic Wars* (12.66), written by the Roman historian Appian. This is how he describes a ceremony presided over by Mithradates, king of Pontus, after his victory over the Roman Murena:

He offered sacrifices to Zeus Stratios on a tall stack of wood placed on a high mountain, according to the following traditional custom. To begin, the kings bring wood, and after installing on the nearby plain a mound of less importance, they place on the higher of the two hearths milk, honey, wine, oil, and all sorts of aromatics to burn; as for what is found in the plain, they place on top bread and something for the helpers' meal. This is also the type of sacrifice practiced by the Persian kings at Pasargadae. Then they light the wood. When it burns, it is so great that it can be seen from far off—1000 stadia away—and, as the air burns, they say it is impossible to approach for several days.

The evidence is late. But Pontus was a considerably Iranized country, as Strabo frequently says—and he was from Pontus. Mithradates presents himself as a Hellenized sovereign, without repudiating his Iranian origins. There can be no doubt that behind

Fig. 33. Magi and sacrifices.

Zeus Stratios ['Warrior'] there lurked an Iranian god, albeit partly Hellenized. The author's comparison with the sacrificial practices of Persian kings at Pasargadae is also interesting, even though it involved Persian princes (fig. 36, p. 250) and not Achaemenid kings. The heritage of the Great Kings remained quite vital in Hellenistic Persia.

The King, the Sacrifices, and the Magi

Wherever he went, the king was accompanied by *magi*. Those around Xerxes, for example, interpreted a solar eclipse (Herodotus VII.37), poured libations at Pergamum "to the spirits of the great men of old" (VII.43♦), sacrificed white horses in the Strymon (VII.113), and sacrificed to Thetis to calm the tempest (VII.191). *Magi* around Cyrus "never failed to sing hymns to the gods at daybreak" (Cyr. VIII.1.23♦). In Darius III's procession, they went "next [after the Fire altars] chanting their traditional hymn" (Quintus Curtius III.3.9♦; cf. V.1.22). Because of their position, the *magi* were justified in reserving part of the booty for the gods (Cyr. VII.3.1; VII.35.1). *Magi* in the *Cyropedia* (VIII.3.11; VIII.1.23) chose the gods to whom the king had to sacrifice, "for the Persians think that they ought much more scrupulously to be guided by those whose profession (*technitai*) is with things divine than they are by those in other professions" (VIII.3.11♦; cf. Strabo XV.1.68, who compares them to the Sages of Mauryan India).

One of the *magi*'s numerous functions in Persian society and in relation to the king was to play an authoritative role in all of the sacrifices. Herodotus says this quite clearly:

When the [worshipper] has cut up the animal and cooked it, he makes a little heap of the softest green-stuff he can find, preferably clover, and lays all the meat upon it. This done, a Magus (a member of this caste is always (*nomos*) present at sacrifices) utters an incantation over it. . . . Then after a short interval the worshipper removes the flesh and does what he pleases with it. (I.132♦)

Strabo also makes many allusions to the role of the *magi*:

To fire they offer sacrifice by adding dry wood without the bark and by placing fat on top of it; and then they pour oil upon it and light it below, not blowing with their breath but fanning it; and those who blow the fire with their breath or put anything dead or filthy upon it are put to death. (XV.3.14♦)

Then Strabo gives information concerning the sacrifices that were observed in his time in Cappadocia:

And to water they offer sacrifice by going to a lake or river or spring, where, having dug a trench leading thereto, they slaughter a victim, being on their guard lest any of the water near by should be made bloody, believing that the blood would pollute the water; and then, placing pieces of meat on myrtle or laurel branches, the Magi touch them with slender wands and make incantations, pouring oil mixed with both milk and honey, though not into fire or water, but upon the ground, and they carry on their incantations for a long time, holding in their hands a bundle of slender myrtle wands. (XV.3.14♦)

An image of Persian origin illustrates Strabo's words to some extent. It is found on a stela discovered near Dascylium in Hellenespontine Phrygia, but it appears to be nearly identical to other illustrated items (fig. 33). Two persons (fig. 33b) stand before what appears to be a tall altar on legs. They wear Persian dress; their mouths are covered with a veil, and in their hands they hold a bundle of rods; the heads of a bull and a ram are placed on a bundle of branches in front of them. The veil and the bundle of twigs correspond to objects held by the officiant in the *Avesta*: the *barsom* and the *pādam*,

respectively. The officiant bearing the *barsom* is found in several iconographic representations (Dalton XIV.48–49). Nonetheless, not all of the information in Strabo is confirmed. He states, for example, that in “the places where the Fire burns” (*pyratheia*) and “where the Magi keep the fire ever burning . . . the people do not sacrifice victims with a sword either, but with a kind of tree-trunk, beating them to death as with a cudgel” (XV.3.15♣); On the other hand, on a Persepolis seal, an officiant is shown grasping a mouflon [wild sheep with curled horns] in his right hand and holding a short sword in his left (Schmidt II, pl. 15). This “contradiction” serves to remind us on the one hand that Strabo’s information is late and on the other that cultic forms were not necessarily identical throughout the Empire (see fig. 33e).

Thus, the *magi* were not strictly priests but ritual experts whose mediation allowed the sacrificer to consume the meat offered to the deity. They are cited several times in this function in the Persepolis tablets. They were responsible to make libations and received the necessary materials from the administration for this purpose:

12 *mariš* of wine, at the disposal (*kurmin*) of ?, Irdakurradduš the *magus* (*makuš*), who carried out the *lam* sacrifice, received them for the libation in the *lam* ceremony. From the first to the 12th month, 12 months in all, 19th year. For 1 month, he received 1 *mariš*. (PF 758)

The *magi* were able to do this because of their special knowledge. If, for example, they made sacrifices to Thetis (Herodotus VII.191), it was because they had particular authority in this regard. In one of his polemics against the *magi*, Pliny the Elder describes a precious stone, a form of amethyst: “They keep off hail and locusts if they are used in conjunction with an incantation which they prescribe” (XXXVII.40.124♣). Other precious stones, agates, were reputed by the *magi* to “avert storms and waterspouts and stop the flow of rivers” (XXXVII.54.142♣).

Sacrifices and Banquets

The Classical authors especially describe animal sacrifices: Cyrus offers horses to the Sun, as well as “some exceptionally handsome bulls for Zeus and for the other gods as the *magi* directed” (Cyr. VIII.3.11♣, 24). The importance of meat sacrifices is emphasized by Strabo in many passages dedicated to Persian and/or Iranian sacrifices. Quite another picture emerges, however, from the Persepolis tablets: the administration basically delivered grain, beer, or wine. Sometimes, it is true, the priest traded these products for sheep, but this action seems to have been reserved for a particular kind of sacrifice, the *kušukum*, offered especially in honor of Elamite gods. The liquid products were probably used for the libations, which all of the Classical authors (including Strabo) indicate most often comprised oil, milk, honey, and wine. Note also that, in the images on seals, animal sacrifices are relatively rare.

In Strabo, at the end of the ceremony the meat is divided among the participants; none of it is set aside for the deity, who, the Persians say, desires only the soul (*psychē*) of the sacrificial victim and nothing else (XV.3.13). An illustration of this postsacrificial custom of sharing is also found in several Persepolis tablets that end with the formula “and the *kurtāš* ate [the grain]” (PF 336–37). This probably refers to the organization of a festival. Each great sacrificial festival was in fact followed by a banquet, as Xenophon explains: “To all the winners [of chariot races Cyrus] gave cups and cattle, so that they might sacrifice and have a banquet. . . . When it was all over, they went back to the city to their lodgings” (VIII.3.33–34♣). But one detail given by Xenophon should be stressed: “The victims are omitted when the king does not offer sacrifice” (Cyr. VIII.3.34♣). In

other words, the sacrifice was not intended solely to honor the gods; the festival and accompanying banquet exalted the might and generosity of the king.

An excellent confirmation of this custom is found in a testimony from the beginning of the Hellenistic era:

When [the soldiers] had arrived in Persepolis, the capital (*to basileion*), Peucestes, who was general of this land, performed a magnificent sacrifice to the gods and to Alexander and Philip; and after gathering from almost the whole of Persia a multitude of sacrificial animals and of whatever else was needed for festivities and religious gatherings (*panēgyris*), he gave a feast to the army. (Diodorus XIX.22.1◊)

Then Diodorus describes the arrangements made by Peucestes to position the participants at the festival on the occasion of the sacrifice. They were placed in four concentric circles, in accord with their hierarchic and social status:

In the inner circle with a perimeter of two stades each of the generals and hipparchs and also each of the Persians who was most highly honoured occupied his own couch. In the middle of these there were altars for the gods and for Alexander and Philip. (22.2-3◊)

There is hardly any doubt that Peucestes undertook the organization of Achaemenid religious festivals for his own profit. We know that in encampment and in battle, the Great King was always placed at the center (e.g., *Cyr.* VIII.5.8). The arrangement of the royal processions shows clearly that everyone in them received a place strictly in accord with his titles, his duties, and the status that the Great King afforded to him. Xenophon himself has a long digression on how important Cyrus considered protocol to be during the organization of the banquet that followed a sacrifice (*Cyr.* VIII.4.3). Peucestes had obviously adapted the ceremony to the new conditions arising with the Macedonian conquest. He had the altars dedicated to Alexander and Philip placed in the center, but because he was a recognized partisan of a collaboration loyal to the Persian aristocracy, he accorded them a central place alongside the most eminent Macedonian leaders. What is noteworthy is that the organization of the sacrifice and the banquet were prepared in a context of competition between Peucestes and his rival, Eumenes. It is very clear that the distribution of meat to the soldiers had the objective of maintaining their loyalty (Diodorus XIX.21.3). Some time later, Eumenes himself "performed a sacrifice to the gods and entertained the army sumptuously" (24.5◊). In fact, Eumenes "reason[ed] that Peucestes was playing up to the crowd in furtherance of his desire for the chief command" (23.1◊). And Diodorus specifies further that it was in his capacity as satrap of Persia that Peucestes presided over the ceremonies. It is thus tempting to think that, by doing this, Peucestes had attempted to adorn himself with the prestige that surrounded the Great King during the organization of festivals and sacrificial banquets.

The King and the Cult of Ahura-Mazda

The links between the king and Ahura-Mazda are abundantly attested in the royal inscriptions, as has already been stressed several times. In the prayers of Darius I, Ahura-Mazda, "the greatest of the gods," is most often invoked alone (*DPh*, *DPe*, *DSz*, *DSaa*), less commonly in the company of the "other gods" (*DPd*, *DPf*). This is confirmed later in the speeches of consolation that a eunuch addressed to Darius III, who was distraught over the fate of the princesses and royal sons after the battle of Issus. Their only suffering, the eunuch explained to the king, was that they missed only "the light of your countenance, which I doubt not but the lord (*kyrios*) Oromasdes [Ahura-Mazda] will yet restore

Fig. 34. Ahura-Mazda.

to its former glory" (Plutarch, *Alex.* 30.5♦). Let us also mention an episode from the reign of Artaxerxes II as it is recorded by Plutarch. After the supreme punishment was imposed on a felonious son, "going forth into the court [of the palace], he worshipped the sun, and said, 'Depart in peace, ye Persians, and declare to your fellow-subjects how the mighty Oromasdes hath dealt out vengeance to the contrivers of unjust and unlawful things'" (*Art.* 29.12♦). Ahura-Mazda was indeed the source of royal power and influence (*farnah*).

Outside of these examples, even the name of Ahura-Mazda is rarely mentioned. Sometimes he is recognizable under the name of Zeus. This is certainly the case in Herodotus's digression on the Persian cults: "Zeus, in their system, is the whole circle of

the heavens, and they sacrifice to him from the tops of mountains" (I.131♦). We can in fact recognize this as a muted echo of the god "who created heaven, who created earth." It was also certainly Ahura-Mazda to whom were dedicated "the holy chariot of Zeus" brought to Greece by Xerxes (VII.40;♦ VIII.115), the "chariot sacred to Zeus" in Cyrus's procession (Cyr. VIII.3.12♦), and again "the chariot consecrated to Jupiter" in the procession of Darius III (Quintus Curtius III.3.11♦). But it would be simplistic to "translate" Zeus automatically as Ahura-Mazda. The Persepolis tablets mention Ahura-Mazda only rarely. In the available documents, an attendant receives items for sacrifice to Ahura-Mazda and other gods. We have only one attestation of a sacrifice honoring Ahura-Mazda alone (PF 771). This silence is hard to explain solely on the basis of the uneven survival of the documentation. The following solution has been proposed: one of the sacrifices, the *lan*, was practiced regularly by the *magi* in the context of a official state cult in honor of the great god. This hypothesis offers the advantage of restoring the importance we would expect Ahura-Mazda to have in Darius's Persia. But we must recognize that we lack what might be called tangible evidence.

The iconography and identification of the winged disk remain controversial. Without discounting the opposing arguments, we will here accept the hypothesis that it is indeed a representation of Ahura-Mazda. This winged disk, from which a bearded figure identical to the king frequently emerges (fig. 34), is found on many Persepolis reliefs. But the winged disk appears on nearly every Achaemenid seal, and not only on seals depicting a royal figure. Several seals on Treasury tablets show a scene with two Persians worshipping Ahura-Mazda.

The King and the Worship of Fire

We know that Fire was one of the elements of nature that the Persians worshiped (Herodotus I.131). Strabo also states that Fire and Water were the elements most honored (XV.3.14). He continues: "And to whatever god they offer sacrifice, to him they first offer

Fig. 35. Fire altars and cult.

prayer with fire" (XV.3.16♦). According to Dinon (*FGrH* 690 F28), "of all of the gods, the Persians raise statues (*agalmata*) only to Fire and Water." The Sakan Sirakes was aware of this, for he invoked "the eternal Fire and the sacred Water" to win the confidence of Darius (Polyaenus VII.11.12). It was probably because of the sacred character of Fire that the burning of corpses was forbidden (Strabo XV.3.18; cf. Ctesias §57: *para ton nomon*). In the Persepolis tablets, we find two titles whose roots are related to fire: **athravapati-* and *atruša*. The holders of the first title filled administrative functions that do not seem to have had anything to do with the religion. The second ('Guardians of the Fire') was different and is mentioned more often. The context is sometimes ritual, but Fire worship as such is not explicitly attested. Note, however, that one of the deities mentioned in the tablets, Naryasanga, maintained a privileged relationship with Fire. The most that is safe to assume is that in each place where these attendants are mentioned there was a Fire sanctuary. Indeed, we have no archaeological evidence from the Achaemenid period, but the importance of Fire sanctuaries in the Hellenistic period (fig. 36) undoubtedly exhibits continuity with the Achaemenid period.

At Naqš-i Rostam, as we have seen (fig. 16, p. 211,) Darius stands before a Fire altar with leaping flames, the scene surmounted by a winged disk and a crescent moon. It is hard to grasp the dynamics of the scene—if it is even intended to portray anything

Fig. 36. Hellenistic Persian coin showing a fire temple.

specific. We may nevertheless suppose that it refers, in a stylized, sacred manner, to a sacrifice offered personally by the Great King before a fire altar. A similar scene is found on numerous stamps on Treasury tablets (fig. 35). One of the most remarkable representations is a seal (fig. 35b) inscribed with the name Zarathustriš. Beneath the emblem of Ahura-Mazda, on each side of a fire altar stand attendants in Persian garb. The attendant on the left holds a bundle of ritual rods (*barsom*) in his hand, and the attendant on the right holds a libation spoon in both hands. This is the only known representation of the sacrifice later known as the *ataš-zohr*.

In any case, the picture at Naqš-i Rostam and the Classical texts together imply privileged relations between the king and Fire. Perhaps it is Fire that

Xenophon's Cyrus invokes, using the name Hephæstus, in order to strengthen the courage of the soldiers during the assault led by his hero against Babylon (*Cyr.* VII.5.22). The order of items in the royal processions, spelled out for us by Xenophon, expresses clearly the place that Fire held in the reality of royal power. In Cyrus's cortege, after the chariot of Zeus and the chariot of the Sun, and before the chariot of the king, "followed men carrying fire on a great altar" (*Cyr.* VIII.3.12♦). However, Xenophon says nothing of specific sacrifices in honor of Fire (3.24). Fire assumed an even more eminent position in Darius III's cortege:

Now the order of march was as follows. In front on silver altars was carried the fire which they called sacred and eternal (*Ignis, quem ipsi sacrum et aeternum vocabant*). Next came the Magi, chanting their traditional hymn. (*patrium carmen*; Quintus Curtius III.3.9–10♦)

Finally, the practice of extinguishing the sacred Fires when the king died (Diodorus XVII.114.4–5) attests to the facts that (1) there were official Fire sanctuaries in all of the satrapies (guarded by the *magi*: Dinon, *FGrH* 690 F28) and (2) that there was an official religion linked very closely to the person and majesty of the king.

The King, Mithra, and the Sun

The Sun was another of the natural elements mentioned by the ancient authors that was worshiped by the Persians (cf. Plutarch, *Art.* 29.12). In the festival organized by Cyrus in Persia was a chariot of the Sun "with white harnesses, crowned like the chariot of Zeus"; the cortege also included horses as "a sacrifice for the Sun," soon to be sacrificed in the fire (*Cyr.* VIII.3.12, ♦ 24). Let us also remark in passing that Herodotus (I.216♦) said of the Scythians—an Iranian people—"the only god they worship is the sun, to which they sacrifice horses." Without doubt the Sun was included among "the gods who have our country in their keeping" to whom Xerxes urged the Persians to pray

before crossing the Hellespont (VII.53♦). The place of the Sun and its relationship with horses are also clearly brought out in Quintus Curtius's description of Darius III's order of march:

When the day was already bright, the signal was given from the king's tent with the horn; above the tent, from which it might be seen by all, there gleamed an image of the sun enclosed in crystal. . . . [The Fire altars and the chariot of Jupiter/Ahura-Mazda] were followed by a horse of extraordinary size, which they called the steed of the Sun. Golden wands and white robes adorned the drivers of the horses. (III.3.8, 11)

The relationship between Mithra and horses is also well attested, especially by Strabo. According to him, every year the satrap of Armenia was required to send to the court 20,000 colts to be sacrificed during the festival celebrated in honor of Mithra (*Mithrakāna*; XI.14.9; cf. Xenophon, *Anab.* IV.5.24 and IV.5.35: Helios). The offering of a hecatomb of horses to the Sun by Cyrus occurred at the Mithrakāna. But the sacrifice of horses was not reserved exclusively for the cult of Mithra. Recall, for example, that when the *magi* arrived at the River Strymon in Thrace they "tried to propitiate [it] by a sacrifice of white horses" (Herodotus VII.113♦). Another passage in Herodotus (I.189) also brings together sacred white horses and a river. It is thus risky to establish the identity of a god by the kind of animals offered to him in sacrifice.

It is frequently thought that the Persians assimilated the Sun to Mithra, as claimed by Strabo (XV.3.13), Hesychius, and the *Suda*. Nonetheless, modern debate about this continues at a lively pace, for the documentation is both very heterogeneous and full of contradictions. No sacrifice to the Sun (or to Mithra) is recorded in the Persepolis tablets. Note also that no royal inscription refers explicitly to Mithra (or to Anāhita) prior to Artaxerxes II. Darius sometimes lifts his prayers and thanks to "Ahura-Mazda and the other gods" (*DPa*, *DPf*). It is generally supposed that this expression includes (among others) Mithra and Anāhita. Two of the *Yashts* of the *Avesta* are dedicated to Anāhita and Mithra, but their use is problematic; it is in fact not easy to distinguish the various chronological strata. This observation holds still more firmly for the Greek and Latin texts, for a number of late ones refer to the solar (and military) cult of Mithra (*Sol Invictus*), which was strikingly popular in the Roman period. In Xenophon, Cyrus the Younger also evokes Mithra in his paradise (*Oec.* IV.24). Artaxerxes acclaimed the exceptional size of a pomegranate offered to him by a simple Persian peasant (Plutarch, *Art.* 4.5; Aelian, *VH* 1.33). This was because Mithra, the god of oaths and contracts, a warrior god, was also the god who protected fields and harvests. It was "he who gives favor at his whim, who gives fields at his whim, who does nothing bad to the one who plows, who increases the waters, who hears the appeal, who spreads the waters, who makes the plants grow, who gives increase." He follows the paths "that make fertile fields." In this same *Yasht* 10 of the *Avesta*, he is saluted as "Mithra of the vast pastures." The attributes of just warrior and protector of the earth and peasants were complementarily fused with each other in the person of Mithra, just as they were in the person of the Great King.

We know from Xenophon (*Cyr.* VIII.3.9), Herodotus (VII.54), and Quintus Curtius (III.3.8: *patrio more*) that the royal procession set out at sunrise. But there is nothing to make us think that in doing this the Persians were specifically honoring Mithra. Perhaps they honored the god Hvarīra, who is attested in the Persepolis tablets, if he indeed personified the spirit of the sunrise, as some believe. It is equally improbable that the prayer

addressed to the Sun by Xerxes before crossing the Hellespont was in reality directed specifically to Mithra.

One of the most troubling pieces of evidence is late: when before the battle of Arbela Darius III invoked "the Sun and Mithras, and the sacred and eternal fire" (Quintus Curtius IV.13.12♦)—a statement that implies a formal distinction between the two deities, whatever their original genetic relationship may have been. It makes sense at this point to compare this text with another piece of evidence that also dates to the reign of Darius III. A speech put in the king's mouth by Plutarch (*Alex.* 30.7) reveals that, to the Persians, Mithra was both the god who guaranteed contracts (as confirmed by the Iranian and Greek documentation) and the god of light. This indicates that Mithra, among all his functions (warrior, protector of the fields, etc.), maintained a special relationship with the Sun, the source of light. To be sure, Mithra was not the only deity endowed with radiant force. Ahura-Mazda was also (and first of all) the source of light (cf. Plutarch, *Alex.* 30.5). But the two items are not necessarily mutually exclusive, for many (if not all) deities have plurifunctional properties and share common or related characteristics. All in all, the complex case of the identity of Mithra is not closed; the best we can do is to recognize, on the one hand, that, in the Achaemenid period, Mithra was closely related to the Sun and, on the other hand, that there was never either formal or exclusive assimilation (at least not in the official forms of the religion; it is not easy to penetrate into popular beliefs).

We have seen that during the festivals of Mithra (*Mithrakāna*) thousands of horses were offered to the god. This is the only festival for which we are informed about the special role played by the king—that is, about one of the aspects of his participation. In a digression about drunkenness, Athenaeus quotes Ctesias and Duris in these words:

Ctesias says that in India the king is not permitted to get drunk. But among the Persians the king is allowed to get drunk on one day, that on which they sacrifice to Mithra. On this point Duris, in the seventh book of his *Histories*, writes as follows: "In only one of the festivals celebrated by the Persians, that to Mithra, the king gets drunk and dances 'the Persian'; no one else throughout Asia does this, but everyone abstains on this day from the dance." (X.434e♦)

To tell the truth, the evidence remains difficult to interpret, especially when we compare a fact provided by Demetrius of Skepsis relating to the time of Antiochus the Great. According to him, "it was the habit not merely of the king's friends but also of the king himself to dance under arms at dinner (*deipnon*)" (Athenaeus IV.155b♦). But, from the time of the Great King to the Seleucid king, similar features may have concealed differing functions (in the Persian court, only the king danced the *persica*). We know in any case that, at the Achaemenid court, dances were part of the ritual: when "Cyrus" performed the customary sacrifice and led the Persians in their national (*kata ta patria*) dance" (Xenophon, *Cyr.* VIII.7.1♦). We also know that the *persica* was widely known. Xenophon presents it as an expression of joy among the Persians (*Cyr.* VIII.4.12). Duris specifies that the Persians regularly gave themselves over to it, in the same way that they took up horsemanship, because it strengthened the muscles. One can well believe this, if one recalls Xenophon's description:

Lastly, [a Mysian] danced the Persian dance, clashing his shields together and crouching down and then rising up again; and all this he did, keeping time to the music of the flute. (*Anab.* VI.1.10♦)

Let us note in passing that Duris's comparison of the *persica* with riding exercises is perhaps not fortuitous. Aelian, who certainly got his information from Ctesias, records that the Persians banged bronze weapons in front of their horses to accustom them to the clangor of battle (*Anim.* XVI.25). Could this be a fleeting allusion to the shields struck by the soldiers while dancing the *persica*? In any case, it appears that the *persica* was a military dance, quite appropriate for honoring a warrior-god such as Mithra.

It is also noteworthy that on the day of the festival of Mithra, only the king could dance the *persica*. Likewise, only the king could become drunk. Drunkenness was perhaps a common condition among the Persians, including their kings, since according to Plutarch (*Art.* 6.4), Cyrus the Younger—to demonstrate his royal qualities—boasted of holding his liquor better than his brother Artaxerxes. And, according to Ctesias (*Persica* §45), Xerxes II perished at the hand of conspirators “when after a festival he fell asleep drunk in his palace”! It has sometimes been supposed that royal drunkenness on the day of *Mithrakāna* was due to drinking *haoma*, which is considered an intoxicating beverage but whose ingredients remain hotly disputed; but this is sheer speculation. Would not royal drunkenness instead relate to a fertility rite, symbolized by the vine?

The Worship of Anāhita

Anāhita, like Mithra, does not appear in the royal inscriptions until Artaxerxes II, but we know that he granted special privileges to her worship in all of the imperial capitals, from Bactra to Sardis. Without devaluing the meaning of Artaxerxes II's decrees, we can surmise, however, that devotion to the goddess did not result simply from a sudden change; worship of her must have evolved over a long period of time.

Other than late attestations of Anāhita in Asia Minor in the form of Anaitis or Persian Artemis, evidence for her worship is basically limited to scenes on seals and rings. One of the seals, belonging to Gorgippa (Anapa), shows (fig. 37a) a king dressed in a long robe and wearing a crenellated crown; he extends both hands toward a woman, who also wears a crenellated crown. She appears in a radiant nimbus, standing on a lion; in her right hand she holds a flower, in the left a baton. Another seal (Louvre, Coll. de Clercq) shows (fig. 37b) a woman seated on a chair with a low back, feet on a footstool; she wears a crown and holds a lotus flower in her left hand; with her right hand she is about to take a dove being presented by a young child standing in front of her; behind the child we recognize a footed censer. Another female figure (also wearing a crenellated crown) fills

Fig. 37. Anāhita. (a) The king before Anāhita? (b) Representation of Anāhita?

out the scene at the right. These two seals are often compared with a scene on a ring from the Oxus treasury: a woman is seated on a couch with a low back; she wears a crenellated crown; she holds a flower in her right hand and a crown in her left.

Although the interpretation is contested, these are probably three representations of Anāhita. The connections with the dove are well attested. The connection with lions is brought out in an anecdote in Aelian, who records that in a sanctuary of Anaitis in Elymais tame lions roam freely (*Anim.* XII.23). Furthermore, we have a document whose date is more certain: a seal impression on Treasury tablets portrays a woman, a goddess, also surrounded by a radiant nimbus (PTS 91). This document to some extent furnishes the missing link. With this evidence, the figure of the king facing Anāhita riding on her lion can be added to the file on relations between the Great King and the deities. Eventually, we will need to consider certain modifications that Artaxerxes II made to the worship of the goddess (chapter 15/8).

Another equally interesting fact is that the imagery of the first seal very closely resembles Urartian and Mesopotamian depictions. It seems clear, in this context, that Anāhita owes much to Mesopotamian Ištar. Because of this, it is reasonable to suppose that syncretism was at work at least as early as the arrival of the Persians in these regions. This is probably what Herodotus meant when he wrote that the Persians “learned from the Assyrians and Arabians the cult of Uranian Aphrodite” (I.131♦). We are thus led to believe that even though the goddess is not mentioned in the inscriptions of the early kings, she was quite certainly worshiped at an early period. We should also recall that, according to Tacitus (III.62), there was a sanctuary in honor of Anaitis [Persian Diana] in Lydia as early as the reign of Cyrus.

Chapter 7

People and Life at Court

1. Sources and Problems

In the foregoing chapters, I have already offered a partial account of the way that the central court functioned as the locus of power par excellence: it was where the king lived with his family and household, where the nobility had to reside, where administrative and strategic decisions were made, where the satraps were summoned or where they came to consult with the king, where foreign ambassadors were received, where festivals and sacrifices presided over by the king were held, and so on. Paradoxically, documentation of court life is rare and unevenly distributed. The Persepolis tablets occasionally provide indirect but important information, despite their narrowly administrative character (see chap. 11), but it must be said that most information comes directly or indirectly from the Greek authors of the fourth century and from Alexander's historians. The former depend most often on Ctesias and other court writers, such as Dinon; both are abundantly used by two authors we quote frequently, Plutarch in the *Life of Artaxerxes* and Aelian in his *Historical Miscellany*. Many other authors focused on the Achaemenid court (e.g., Heraclides of Cyme, Phylarcus, Theopompus). Their works are lost, but fortunately they are quoted by Athenaeus, to whom we will frequently refer. On the other hand, for the fifth century we know practically nothing specific, because unlike Ctesias, Herodotus is hardly interested in court life, aside from his discussions of Darius's marriages, the (supposed) role of Atossa regarding her royal husband, and the romance of Masistes with which his *Inquiries* ends.

In a very general way, the fourth-century authors and Alexander's historians were guided by the desire to evoke a sense of wonder in their readers by dwelling on what they considered most characteristic of the Great King's court—its opulence, which they took as both a manifestation of its power and proof of its weakness. Also important to us are the numerous details they provide on the organization of the royal banquets and ponderous digressions on the dissolute life and nefarious influence of the Persian princesses. They are much more sparing of details on administrative organization, with the exception of lists. Thus Xenophon enumerates “tax-collectors, paymasters, boards of public works, keepers of his estates, stewards of his commissary department, . . . superintendents of his horses and hounds” (*Cyr.* VIII.1.9◊). The author of *De Mundo* writes: in addition to the guards, servants, and porters, there were “stewards of his revenues and leaders in war and hunting, and receivers of gifts, and others . . .” (398a 20–30◊). But it must be acknowledged that we know nothing more about most of these people than their titles.

The selection of information was obviously carried out as a function of a string of cultural presuppositions and ideological stereotypes. It is clear that it was the king's bed and the king's table that most attracted the Greeks. All we need to look at for confirmation of

this is the abbreviated inventory of Darius III's camp (Athenaeus XIII.608a). Using these sources thus poses a methodological problem that has already been pointed out several times in this book. In this particular case, we must not "throw the baby out with the bath-water." That is, in reading the Classical authors, we must distinguish the Greek interpretive coating from the Achaemenid nugget of information. Rejecting the interpretation the Greek writers gave to an Achaemenid court custom does not imply that the custom or practice they were dealing with was pure and simple invention on their part.

Tents and Palaces

Let us also stress the fact that many authors allude to Persian court customs in the context of wars fought by the Persian, Greek, and Macedonian armies. Thus, they were particularly interested in booty, a fact that resulted in fairly exact descriptions (albeit with selective quotation to some extent) of the Persian camps captured after battles. In Alexander's day, the Great King fought far from his palace. He and his court, as we have seen, migrated periodically between the various royal residences. The king relocated with not only his close family, household, and courtiers, but also the various departments of the administration. The mountains of luggage were transported on camelback and muleback, as well as by a special kind of porter whose Persian name, given by Quintus Curtius, is *gangabas* 'treasury porters' (III.13.7♦). The word 'treasury' (Persian **ganza*: III.13.5♦) also refers to all of the paraphernalia that followed the king. In fact, "the greater part of his money and everything else a great king takes with him even on campaign for his extravagant way of living" (Arrian II.11.10♦); "when the Persian king goes to war, he is always well provided not only with victuals from home (*oikos*) and his own cattle" (Herodotus I.188♦).

When the group stopped, specialized workers had to level the ground and erect the royal tent. Xenophon marveled at how quickly "each one has assigned to him likewise the part that he is to do" in packing and unpacking all of the baggage (Cyr. VIII.5.2, 4–5♦). The royal tent was erected in the middle of the camp (VIII.5.3, 8–10) and marked with distinctive symbols (cf. Quintus Curtius III.8.7). Each officer also had a tent of his own, recognizable by an ensign flying from a mast (Cyr. VIII.5.13). The royal tent was truly monumental, reproducing to the last detail the private apartments of the palace. According to Herodotus (IX.70♦), Xerxes' tent (left in Greece for the use of Mardonius) even contained "the manger used by his horses—a remarkable piece of work, all in bronze" (cf. Quintus Curtius III.3.21). As in any palace, there was a gate, where entry was strictly controlled. There was also a banquet hall; its luxury amazed all the Greeks who had taken possession of Mardonius's tent after the battle of Plataea. This was a cloth and leather monument of impressive dimensions. According to Chares of Mytilene, Alexander's banquet tent was raised on columns 15 m high. The interior of this portable palace measured nearly 700 m in circumference (Athenaeus XII.538b–d, 539d). This was the tent where Alexander held court and granted audiences, after the model of the Great Kings on the road. He sat on a gold seat surrounded by his personal guard (539f), which included 500 Persian *mēlophoroi* 'bodyguards' [lit.: 'apple-bearers'] (Aelian, VH IX.3♦). We can understand how the Athenians were later able to conceptualize their own Odeon on the model of Xerxes' tent.

Descriptions by Greek authors go on to provide original information about this tent. Plutarch, for instance, records our only information about the splendor of Darius III's bathing rooms:

Darius's tent, which was full of splendid furniture and quantities of gold and silver, they reserved for Alexander himself. . . . When he beheld the bathing vessels, the water-pots, the pans, and the ointment boxes, all of gold curiously wrought, and smelt the fragrant odours with which the whole place was exquisitely perfumed, and from thence passed into a pavilion of great size and height, where the couches and tables and preparations for an entertainment were perfectly magnificent, he turned to those about him and said, "This, it seems, is royalty." (*Alex.* 20.12–13♦)

The reflection placed on Alexander's lips reminds us of the reaction of Pausanias and the Greeks to the indolent luxury of Mardonius's tent, which they seized after the battle of Plataea (Herodotus IX.82), and many other authors dwell on the splendor of the Persian generals' tents. The descriptions of Alexander's tent are equally rich in information, since he obviously took up a custom of the Great Kings. In general, all the ancient authors' expatiations on the luxury of Alexander's court (reprehensible in their eyes) underline the continuities with Achaemenid practice.

The Classical texts are even more important in that we know so little of the environment within the royal residences. At Susa, a residential quarter containing the royal apartments has been found. Movement between rooms was accomplished with special corridors. But it is generally thought that royal Susa included only a very few permanent residences. The same thinking has been offered about Persepolis. It is sometimes inferred that, during the migrations of the court, the royal entourage stayed in tent cities set out on the plain below the terrace. Indeed, we know that the court included a great number of people because, according to Dinon and Ctesias, 15,000 people, including the soldiers, were fed every day (Athenaeus IV.146c). Nevertheless, these interpretations give rise to several methodological reservations.

First of all, these interpretations rely on gaps in the archaeological record. It is clear that any conclusions regarding the permanent occupation of Persepolis must be considered premature as long as the plain has not been systematically excavated. We know that from Cambyses' time on, palaces and residences were built there. We also know that in Artaxerxes II's time a new palace was built at Susa, down on the Shaur River. There are other ways in which archaeology is not entirely silent. A bathing room has been found at Persepolis. It seems clear that the Great King retired to bathe there regularly (cf. Aelian, *VH* XII.1), as did the Persian nobles (cf. Polyaeus VIII.16.1; Diodorus XIV.80.8), as well as Alexander at Babylon (cf. Plutarch, *Alex.* 76.1–5; Arrian VII.25). Some reliefs (waiters on the royal table) and objects (dishes) imply the existence of reception halls within the palace. The well-known existence of a military quarter indicates that other buildings had been built for the various guard corps. The *kurtas*, who worked in the many workshops, were perhaps housed nearby as well.

What is more, the Classical texts are sometimes explicit on this subject. The large number of references to the king's bedroom is major evidence: from a passage in Plutarch (*Art.*, 29.3), we can even infer that the walls were not very thick! Again, Diodorus says in his description of Persepolis that "scattered about the royal terrace were residences (*katalyseis*) of the kings and . . . generals, all luxuriously furnished," and he mentions that "private houses (*idiōtikoi oikoi*) had been furnished with every sort of wealth" (XVII.71.8♦, 70.2♦). Bagoas's house (*oikos*), which Alexander gave to Parmenion, should be included among these private residences (Plutarch, *Alex.* 39.10).

A comparison of the descriptions of the Achaemenid palaces with the descriptions of Alexander's tent is also interesting. According to Chares, Alexander took his meals with

his guests in a sumptuous tent at Susa, while the soldiers, foreign ambassadors, and tourists ate in the palace courtyard (*aulē*) (Athenaeus XII.538c). Heraclides writes of royal Achaemenid meals in which the Great King and his guests dined in two halls (*oikēmata*) in the royal palace while the soldiers of the guard and other troops shared their rations in the palace courtyard (*aulē*) (Athenaeus IV.145a–f). We do not know why Alexander chose to organize his festivities in a tent even though the Persian palaces were still standing. Perhaps the explanation can be found in the permanently mobile nature of Alexander's court? There is general agreement that the Persian royal tent was as exact a replica as possible of the palaces at Susa and Persepolis. Protocol and the layout of the rooms corresponded as closely as possible to those of the permanent residences. Furthermore, there were certainly royal apartments, luxuriously furnished, in each of the major cities of the provinces in which the king could stay from time to time.

2. Household Staff

The Chiliarch and the Audience Service

The high court officer best known to the Greeks was undoubtedly the officer they called the chiliarch, whose title may have been rendered in Iranian as *hazarapatiš* 'Commander of a Thousand'. The Persian word is borrowed directly into Greek in the transliterated form *azarapateis* (Hesychius: plural) and also in the less precise form *azabaritēs* (Ctesias §46). The reason this officer appears so often in the works of the ancient authors was that (as they have it) every visitor needed his intercession in order to be granted an audience (see chap. 6/3 above). According to Diodorus of Sicily (XVIII.48.4♠), "The position and rank of chiliarch had first been brought to fame and honour by the Persian kings." Nepos writes of Tithraustes, chiliarch at Artaxerxes II's court, "that he held the second rank in the State" (*Conon* 3.2). Thus, we may say that most ancient writers regarded the chiliarch as the highest person in the Achaemenid court, the controller and supervisor of every department; in short, he acted as prime minister or grand vizier (to use the traditional expression).

This interpretation is highly improbable. For one thing, the documents usually adduced in its support are of quite unequal value. Furthermore, and most importantly, it contradicts what is known of the power structure. The king doubtless had a bureaucracy of scribes and other permanent staff around him. But he never delegated his sovereign power to anyone. Even Parnaka, head of the economic administration of Persia, was subject to him (see chap. 11/10 below). Every bureau chief was personally responsible to him, such as the one who ran the Treasury of the Royal House (perhaps distinct from the imperial Treasuries: see p. 946), whom Nepos calls 'guardian of the royal fortune' (*gazae custos regiae*; *Dat.* 14.3), or the head of the royal correspondence (*astandēs*; Plutarch, *Alex.* 18.8). When the king had to make a decision, either he acted alone or he appealed to a few men chosen according to their recognized abilities. A council with a permanent membership never existed (chap. 3/4 above). Every court job was temporary and could be transferred from one day to the next to another trustworthy man. The author of *De Mundo* (398a♠) says the same thing: this or that person is put in charge of this or that job or mission "with all the other necessary functions" (*kata tēs chreias*).

Consequently, it is highly unlikely that the king was ever flanked by a prime minister who could potentially have assumed a disproportionate role. Like every other court dignitary, the chiliarch was attached to the person of the king and followed him whenever

he relocated and when he went to war. It was doubtless one of the most sought-after titles; hence the expressions used by the Classical authors to characterize it.

But it is customary to distinguish the prestige of the title from the real work of the job; while the work seems to have devolved onto a single person, the title may have been conferred on several. The grammarian Hesychius defined the task of the chiliarchs (*azapateis*) as follows: "They are the introducers (*eisaggeleis*) among the Persians." The Classical texts on the reception of Greek ambassadors have frequently led to the supposition that it is the chiliarch who is shown in the audience reliefs at Persepolis, standing before the king, bending forward, blowing a kiss with his right hand toward the sovereign seated on his throne (fig. 20, p. 218). On this point, the literary evidence is uncertain. At Astyages' court, seen by Xenophon, the cupbearer Sacas played the role of introducer: He "had the office of introducing to Astyages those who had business with him and of keeping out those whom he thought it not expedient to admit" (*Cyr.* I.3.8, ♦ etc.). Xenophon also lists the head of the *skēptoukhoi* 'grand officers' [lit.: 'scepter-bearers'] among the high court dignitaries; they surrounded the king when he left the palace and were entrusted with, among other things, carrying messages to the people who wished to present a petition (VIII.3.19). "Gadatas was chief of the mace-bearers, and the whole household was managed as he directed." He oversaw everything at meals (VIII.4.2♦). *Skēptoukhoi* were also present in the entourage of Cyrus the Younger, but there it is an honorary title rather than a job (Xenophon, *Anab.* I.7.11). It is thus wise to remain cautious about the identity of the person saluting the king in the audience reliefs of the Persepolis Treasury.

However we may define it, the service of the royal audience certainly included many people. Here is how the author of the *De Mundo* pictures and describes the king in his palace:

'The king himself, so the story goes, established himself at Susa or Ecbatana, invisible to all, dwelling in a wondrous palace within a fence gleaming with gold and amber and ivory. And it had many gateways (pylōnes) one after another, and porches (prothyra) many furlongs apart from one another, secured by bronze doors (thyrai) and mighty walls. Outside these the chief and most distinguished men (hoi prōtoi kai dōkimōtatoi) had their appointed place, some being the king's (hoi amph' auton ton basilea) bodyguard (doryphoroi) and attendants (therapontes); others the guardians of each of the enclosing walls, the so-called janitors (pylōroi) and "listeners" (ōtakoustai), that the king himself, who was called their master (despotēs) and deity (theos), might thus see and hear all things. (398a♦)

This text conveys several conceptions that were firmly anchored in the Greek mind, such as the characterization of the king as god. In the text we also gain an impression of a king, shut inside his palace, but who knows all, thanks to numerous Eyes and Ears. The composer of the book of Esther highlights "those who had privileged access to the royal presence" (1:14♦). Xenophon also insists on it (*Ages.* 9.1–2). One of the measures that the Spartan Pausanias took to identify himself with the Persians was that he "made himself difficult of access, and displayed so violent a temper to every one without exception that no one could come near him" (Thucydides I.130.2♦). Furthermore, Ctesias records the legendary story of Sardanapalus who lived as a recluse in his palace, seen only by his eunuchs and his wives (Athenaeus XII.528f).

The author of the *De Mundo* deserves praise for situating the royal audience in its architectural context, even if not all of the elements of the decor are realistic. The visitor

Fig. 38. Gate of Darius's palace at Susa (section).

first arrived at a gate. This term must not be allowed to confuse the reader. The *Gate* was actually an imposing building, distinct in Elamite and Persian vocabulary from the gate of a building. The word became a synonym for the palace and the court, as shown by the expression "Those of the Gate," which became a sort of court title (cf. Esther 2:21, 3:2-3 [JB: Chancellery]), even in Babylonian tablets (e.g., Amherst 258). The best-known example currently is the Darius Gate at Susa, on whose columns Xerxes had a trilingual inscription carved: "Xerxes the king says: 'By the grace of Ahura-Mazda, this *Gate*, Darius the king made it, he who was my father'" (XSd). At the base it measured 40 m by 28 m, and it rose to a height of some 15 m. It comprised three halls. The square central hall measured 21.20 m on a side; it was flanked on the north and south by two oblong halls open to the central hall (fig. 38). At Persepolis, the Gates were decorated with apotropaic reliefs (Royal Hero combating composite animals). At Susa, the passage to the central court was flanked by statues of King Darius. Within the great hall, stone benches were arranged against the walls, where, we suppose, the petitioners waited. In the Gate itself were cut openings, doors giving access to the interior of the palaces. But before gaining access, the visitor had to pass numerous obstacles and go through quite a few check-points.

All petitioners and suppliants came to the Gate (Herodotus III.117, 119; cf. Xenophon, *Hell.* I.6.7-7.10; *Cyr.* VI.1.1, etc.). When Syloson wanted to play his titles for all they were worth, "he hurried to Susa [and] sat down at the entrance (*prothyra*) of the royal palace." There he was interrogated by the guardian of the Gate (*pylōros*; Herodotus III.140♠). When the conspirators of 522 arrived at the Gates, they found themselves confronted by the guardians of the gates; they then penetrated into the courtyard (*aulē*), where "they were met by some of the eunuchs—the king's messengers," who reprimanded the guardians for allowing the Seven to enter (III.77♠). This corresponds to the protocol reported in Esther 4:11:♠

All the king's servants and the people of his provinces know that for a man or a woman who approaches the king in the inner court without being summoned there is one penalty: death.

According to a late (Parthian period) text, each visitor had to give his name, homeland, profession, and reason for visiting, and all of this information was written in a register along with a description of the person and his clothing. Each visitor was also asked to prostrate himself (*proskynesis*) before a portrait of the king (Philostratus, *Vit. Apoll.* 1.37). The Greek authors state that in order to be able to obtain an audience one had to commit oneself in advance to making a *proskynesis* before the king; if one would not, one could only communicate by messages (Nepos, *Conon* 3.3) via the message-bearers.

The Royal Guard: Immortals and Bodyguards

It seems clear that the precautions taken before an audience with the king was granted were intended not only to create the image of an omnipotent king but to guarantee his security as well. Xenophon is particularly insistent on this point. "As he deemed this guard insufficient in view of the multitude of those who bore him ill-will," Cyrus created a protective guard of 10,000 lancers (*doryphoroi*) by recruiting lower-class Persians, who "kept guard about the palace day and night, whenever he was in residence; but whenever he went away anywhere, they went along drawn up in order on either side of him" (*Cyr.* VII.5.66–68♦). They were also entrusted with guarding the royal tent while the king was on the move or on an expedition (VIII.5.4). These 10,000 lancers were included in Xerxes' procession in 480:

chosen for quality out of all that remained—a body of Persian infantry ten thousand strong. Of these a thousand had golden pomegranates instead of spikes on the butt-ends of their spears, and were arrayed surrounding the other nine thousand, whose spears had silver pomegranates . . . the Ten Thousand—a body of picked Persian troops under the leadership of Hydarnes, the son of Hydarnes. This corps was known as the Immortals, because it was invariably kept up to strength; if a man was killed or fell sick, the vacancy he left was at once filled, so that its strength was never more nor less than 10,000. Of all the troops in the army the native Persians were not only the best but also the most magnificently equipped; their dress and armour I have mentioned already, but should add that every man glittered with the gold which he carried about his person in unlimited quantity. They were accompanied, moreover, by covered carriages (*harmamaxai*) containing their women (*psallakai*) and servants, all elaborately fitted out. Special food, separate from that of the rest of the army, was brought along for them on camels and mules. (Herodotus VII.41, 83♦)

This is how Heraclides of Cyme describes those he calls *mēlophoroi* ('bodyguards'; lit.: 'apple-bearers') in his *Persica*:

These formed his bodyguard (*doryphoroi*), and all of them were Persians by birth, having on the butt of their spears golden apples, and numbering a thousand, selected because of their rank (*aristindēn*) from the 10,000 Persians who are called the Immortals. (Athenaeus XII.514c♦)

When Alexander received people close to him to dine in his tent, "inside it stood in line first of all five hundred Persians, called the apple bearers (*mēlophoroi*), wearing cloaks of purple and quince yellow; then came a thousand archers dressed in flame colour and scarlet" (Aelian, *VH IX.3♦*). Quintus Curtius has a similar description of the Immortals: "No others were more adorned with the splendour of barbaric wealth; theirs were golden necklets, and garments adorned with cloth of gold and long-sleeved tunics

adorned even with gems" (III.3.13♦). They are probably the ones shown several times on the Persepolis friezes and the enameled bricks from Susa and on many seals.

The *mēlophoroi* were permanently attached to the king's person. At Gaugamela they fought beside Darius III (Arrian III.13.1) and, along with the Kinsmen, surrounded him during the retreat (III.16.1). In his procession, they marched just behind the royal chariot, after the Kinsmen and the Immortals. Quintus Curtius adds that they were "accustomed to take care of the royal robes" (*vestis regalis*; III.3.15♦), robes that by themselves required a subdivision of the support staff (cf. V.6.5). They remained near the king to guard him during audiences. A portion of the palace interior was reserved for them (Athenaeus XII.514b). To repeat Hesychius's explanation, "among the Persians, they are entrusted with watching over and serving (*therapeia*) the king." The chiliarch probably commanded the thousand bodyguards who constituted an elite within the 10,000 Immortals. This is in fact his only undisputed function (at least etymologically), the function from which his job of introducer probably derived. Because of the close relationship of the *mēlophoroi* with the person of the king, the job of chiliarch could only be given to a person of the utmost trustworthiness; thus, doubtless, the prestigious status accorded him by several ancient authors.

Protocol and Security

When the king left the palace, the royal chariot was surrounded by corps of troops, and the household guard watched over him: "As [Cyrus] proceeded, a great throng of people followed outside the lines" (*Cyr.* VIII.3.19♦). "No one may enter [through the rows of soldiers] except those who hold positions of honour (*hoi timōmenoi*). And policemen with whips in their hands (*mastigophoroi*) were stationed there, who struck any one who tried to crowd in" (VIII.3.9♦). Xenophon also adds this detail: "All the cavalymen had alighted and stood there beside their horses and they all had their hands thrust through the sleeves of their doublets (*kandys*), just as they do even to this day when the king sees them" (3.10♦). In this way, the author makes a connection between posture and security requirements. The custom is also invoked in an interpolation in Xenophon's *Hellenica* (II.1.8♦); according to the author of this gloss, Cyrus the Younger supposedly put to death some close relatives of Darius II "because upon meeting him they did not thrust their hands through the *korē*, an honour they show the King alone. (The *korē* is a longer sleeve than the *cheiris* and a man who had his hand in one would be powerless to do anything.)" Xenophon, in his obsession with royal security, seems to have devised this interpretation for a custom that may have had a quite different significance. For it is precisely when the hand is concealed that it may hold a weapon invisible to the guards! It is tempting to see this required pose as a manifestation of submission to the king according to rules known later from Iran and elsewhere.

Royal Meals and Protocol

Xenophon also attributes the strict protocol governing "Cyrus" s dinner guests to security concerns (VIII.4.3). In actuality, it indicated each one's ranking in the king's esteem (VIII.4.4–5). Nevertheless, as Xenophon also remarks elsewhere (VIII.5.59), there is hardly any doubt that the meals themselves placed the king in a weak position relative to any conspirators. In his portrayal of "Persian decadence," he even adds that the young people who were trained to gather medicinal herbs (p. 330) tried to collect poisonous plants, and he concludes: "There is no place where more people die or lose their lives

from poisons than there" (VIII.8.14♦). Undoubtedly, this opinion is highly exaggerated. We know of only one attempt to poison a king (Diodorus XVII.5.6). Nevertheless, it does seem that at court there was an officer (*edeatros*) specifically assigned to taste all of the foods offered to the king in order to ensure his security (*eis asphaleion*).

Certain picturesque episodes explain the suspicion that could hover around the palace tables. Ctesias (§69) and Plutarch (*Art.*, 19) portray the meals shared by Artaxerxes II's wife Stateira and mother Parysatis. Here is how Plutarch (based on Dinon and Ctesias) tells how Parysatis got rid of Stateira:

The two women had begun again to visit each other and to eat together; but though they had thus far relaxed their former habits of jealousy and variance, still, out of fear and as a matter of caution, they always ate of the same dishes and of the same parts of them. Now there is a small Persian bird, in the insides of which no excrement is found, only a mass of fat. . . . It is called *rhyntakēs* [Indian bird about the size of a pigeon]. Ctesias affirms, that Parysatis, cutting a bird of this kind into two pieces with a knife one side of which had been smeared with the drug, the other side being clear of it, ate the untouched and wholesome part herself, and gave Statira that which was thus infected. (19.3–5♦)

One of Parysatis's servants was put to death even though she was acquitted by the judges (Ctesias). With regard to the problem of poisoning, Plutarch states that there was a punishment reserved for poisoners at the court: "There is a broad stone, on which they place the head of the culprit, and then with another stone beat and press it, until the face and the head itself are all pounded to pieces" (19.9♦). The existence of this torture implies that the threat of poison was taken seriously. Ctesias states elsewhere (apud Aelian, *Anim.* IV.41) that a special Indian poison that resulted in a particularly gentle death was kept in the royal apartments, available only to the king and his mother.

The Great King's Water and Wine

One reason the king generally dined alone was to demonstrate his superior position there as elsewhere—above other mortals—but undoubtedly another reason was to ensure his security. On the model of the Immortals' supplies (Herodotus VII.83), the Great King's provisions and foodstuffs were kept and transported separately. Here is what Herodotus has to say on the subject:

When the Persian King goes to war, he is always well provided not only with victuals from home and his own cattle, but also with water from the Choaspes, a river which flows past Susa. No Persian king ever drinks the water of any other stream, and a supply of it ready boiled for use is brought along in silver jars carried in a long train of four-wheeled mule wagons wherever the king goes. (I.188♦)

Ctesias and many ancient authors confirm the existence of this court practice, whose application obviously was not limited to court travel: it held all year round in the royal palaces. This has often been interpreted from a religious and ritual angle—in his capacity as high priest, the king was subject to food taboos. But this theory does not stand. No ancient author alludes to it, and it is clear that, if necessary, the king could drink some other water, as several anecdotes recorded by Aelian and Plutarch show.

In addition to the constant concern for isolating the king, we also see a concern for protecting his health. In fact, several authors stress that the Choaspes water was "especially clear and tasty." Many remarked that the boiling sterilized the water. In the course of a disquisition on the virtues of different waters, Athenaeus writes: "good water is that which heats or cools in a reasonable time, and when poured into a bronze or silver vessel

does not tarnish it" (II.46b♦); Pliny also stresses that prior heating of water allows it to remain fresh (XXXI.40). It thus may be agreed that the recognized healthy properties of boiled water from the Choaspes—"as [the] report says, a fine water" (Quintus Curtius V.2.9♦)—led it to be chosen above any other.

Medical concerns do not explain everything, however. The Great King's water was also poured into receptacles reserved for his own use in order to protect his life. It was the same for his wine. Heraclides states that during a *symposion* 'drinking banquet' following dinner the king drank a special wine (IV.145c), undoubtedly the Chalybonian wine from Syria, the only wine he used to drink (Athenaeus II.28d). We also know from Dinon that the king drank from a special cup shaped like an egg (XI.503f). Bagoas attempted to assassinate Darius III by pouring poison into it, but the king, forewarned, offered his cup to the conspirator as if to award him special honor, and "compelled him to take his own medicine" (Diodorus XVII.5.6♦).

This is why those who poured wine at the court were so important, especially the director of the department, the Royal Cupbearer. He alone had the delicate task of pouring wine into the royal cup, following the immutable rules of royal protocol: "The cupbearers of those kings perform their office with fine airs; they pour in the wine with neatness and then present the goblet conveying it with three fingers, and offer it in such a way as to place it most conveniently in the grasp of the one who is to drink" (Xenophon, *Cyr.* I.3.8♦). He also served as the taster. For example, Xenophon remarks about Sacas, the taster at Astyages' court: "Now, it is a well-known fact that the king's cupbearers, when they proffer the cup, draw off some of it with the ladle (*kyathe*), pour it into their left hand, and swallow it down—so that, if they should put poison in, they may not profit by it" (I.3.9♦). The cupbearer thus had every opportunity to poison the royal drink, which explains the accusations brought against Alexander's cupbearer Iollas (Arrian VII.27.2). This is why men believed to be faithful were chosen, such as Nehemiah at Artaxerxes I's court (Neh I:11) or the son of the very highly regarded Prexaspes at Cambyses' court (Herodotus III.34). According to one of the founder legends recorded by Nicolaus of Damascus (*FGrH* 90 F66.6–7), Cyrus followed in his adoptive father's footsteps as royal cupbearer in the Median court.

The Court Physicians

Physicians definitely held an important place in the king's trusted household staff. They could only be trustworthy persons, for they too were so well positioned that they would have been able to poison the king (Diodorus XVII.5.3). We know that several Greek physicians practiced at Artaxerxes II's court. One of them is known only by his name, Polycritus (Plutarch, *Art.*, 21.3). Certainly the most noteworthy example is Ctesias himself. This native of Cnidos, which was famous for its medical schools, came from the circle of Asclepiads, who were connected with the sanctuary of the war-god. The exact date and circumstances of his arrival at Artaxerxes' court remain uncertain. Was he drafted by the king because of his medical knowledge, or was he brought to court as a prisoner of war? The fact remains that his presence is attested at least from the time of the battle of Cunaxa, after which he received numerous honors from the king. There is no doubt that he cared for the king, who had been unhorsed during combat (cf. Plutarch, *Art.*, 11.3, 14.1). In any case, he claims "that he himself healed the wound" when his brother Cyrus the Younger assaulted him (Xenophon, *Anab.* I.8.26♦), but the

tales of the battle are too propaganda-laden for us to place total confidence in Ctesias's account. He remained at the court until 398–397, when he returned to his homeland and wrote his *Persica*.

To tell the truth, we have little information about Ctesias's medical career. He himself obviously preferred to talk about his role as a favorite, a confidant, even as a diplomatic intermediary (§§63–64). A late passage attests that he cared for Artaxerxes (*Suda*, s.v. Ctesias), and Photius, in his summary of the *Persica*, notes in passing that he was "Parysatis's doctor" (§60). He was obviously very close to Artaxerxes II's mother; he claims to have obtained some of his information from her (§48: succession of Darius II) and to have received gifts of exceptional symbolic value from the king and Parysatis (*Indica* §4). It was certainly because of his intimacy with Parysatis (and not just because of his love for Laconia, which was denounced by Plutarch) that he intervened directly to ease Clearchus's prison conditions (Plutarch, *Art.*, 18.1–4).

Ctesias notes the presence of another Greek physician at Artaxerxes I's court, Apollinides, a native of Cos (an island off the coast of Asia Minor, also famous for its physicians). This reference is interpolated into the saga of the family of Megabyzus. Apollonides was reputed to have healed wounds that Megabyzus received in the fighting that took place within the palace at the time of Xerxes' succession (§30). Later he would fall in love with Megabyzus's widow Amytis, the king's sister, who was famous for her beauty and her extramarital dalliances (Ctesias §28; Dinon apud Athenaeus XIII.609a). Ctesias gives us a glimpse of the Persian court "through the keyhole," as he often does. "Apollonides told Amytis that she would regain her health via congress with men, seeing that she was having trouble with her womb . . ." (Ctesias §41). Later, after Princess Amytis died, her mother had Artaxerxes punish the doctor as an example: "She had him clapped in irons for two months of torture, then buried alive upon the death of Amytis."

But the first appearance of a Greek physician at the court dates to the reign of Darius. Herodotus tells at great length a veritable novella dedicated to the picaresque adventures of the physician Democedes (III.125–38). This native of Croton in southern Italy practiced his profession freely from town to town in Greece (Aegina, Athens) and was paid from the public funds of the cities that called on his services. Then he settled at the court of Polycrates of Samos. As an outcome of Oroetes' activities against the Samian tyrant, the satrap of Sardis kept Polycrates' retinue close to him, including the foreigners (III.122–25), and he took on the services of Democedes, who was now a slave (III.129). On another occasion, during a hunt, Darius twisted his foot severely. His Egyptian physicians proved unable to heal him, and he appealed to Democedes, whose fame had reached him. Despite his reservations about remaining at the court, the Greek was hardly in a position to refuse his august patient and restored the use of his foot. He thus achieved an enviable status, since he "lived in a large house (*oikos*) in Susa, took his meals at the king's table (*homotrapezos*) . . . great was Democedes' influence with the king (*para basilei*)" (III.132♦). He cured Atossa of an abscess in the breast (III.133). Some time later, he managed to escape his gilded cage (cf. III.130) during the course of a mission Darius sent to Sicily (see p. 139).

According to Herodotus, Darius had already become utterly infuriated by the incompetence of the Egyptian physicians who surrounded him and "who had a reputation for the highest eminence in their profession" (III.129♦). He also states that Democedes had intervened on their behalf with Darius, who wanted to have them impaled.

From the three known examples cited above, we must not draw the premature conclusion that thereafter only Greeks cared for the king and his family. The call for Egyptian physicians had ancient precedent. For Herodotus, in fact, the initial contacts between Cyrus and Pharaoh Amasis anticipated the sending of Egyptian doctors to the Persian court. The Great King “ask[ed] for the services of the best oculist in Egypt” (Herodotus III.1♦). Egyptian medicine and physicians were in fact very well known throughout the ancient Near East; all of the specialties were represented there (cf. II.84). Darius’s interest in Egyptian physicians did not weaken. Around 519, he sent Udjahorresnet back to Egypt, who, after pledging allegiance to Cambyses, had accompanied the king on the return road and eventually ended up with Darius in Elam. His mission was to restore the School of Saïs, a well-known Egyptian center for medical studies; in some of his inscriptions, dated to Cambyses and Darius, he bears the title of

Chief Physician. Despite the silence of the sources and the highly partisan orientation of the Greek sources, there is every reason to suppose that Egyptian doctors continued to frequent the court of the Great Kings (pp. 859–861). In the only evidence regarding treatment of a wound in combat, we see the soldiers caring for one of their own: they “dressed his wounds with myrrh, and bound them up with linen bandages” (Herodotus VII.181♦). The treatment chosen (myrrh and linen) points toward Egypt, but it also reminds us of a scene depicted on a Scythian gold plaque (fig. 39).

Fig. 39. A Scythian cares for his companion (on a vase from Koul-Oba in the Crimea).

It is important to recognize that the evidence on hand tells us almost nothing about the most common illnesses. Let us simply note in passing the information that Herodotus gives on leprosy:

Sufferers from the scab or from leprosy are isolated and forbidden the city. They say these diseases are punishments for offending the sun, and they expel any stranger who catches them: many Persians drive away even white doves, as if they, too, were guilty of the same offence. (I.138♦)

This report is confirmed by a passage in Ctesias. In telling about Megabyzus’s exile to the shore of the Persian Gulf, the doctor states: “Megabyzus, after spending five years in exile, escaped by assuming the appearance of *pisagas*; this is the Persian word for ‘lepers’, and no one can approach them” (§41). These texts imply that there were rules in Persia concerning certain contagious diseases that were considered a divine punishment.

The Magi, Their Herbs, and Their Stones

One of the many decisions Xenophon attributes to his Cyrus is putting the royal Treasury in charge of enlisting physicians, “the very best.” They acted as medical counselors, obtaining everything needed in the way of instruments and remedies (*pharmaka*), solid or liquid. Xenophon also says that Cyrus was disturbed by the fact that his soldiers scarcely took any care of their health. To deal with that, he endeavored to stockpile “such things as would be serviceable in case of sickness” (Cyr. VIII.2.24–25♦). There is

no doubt that these products were basically medicinal plants, which youths were trained to gather during their education (Cyr. VIII.8.14; Strabo XV.3.18). In fact, it seems that the Persians made good use of medicinal plants in every circumstance of their daily life. We know from Herodotus (I.138) and Strabo (XV.3.16) that they were not allowed to urinate or spit into running water. An ancient lexicographer states that to solve this problem they took cress, the prescription for stopping any flow (*Suda*, s.v. *kardama*)!

There is little doubt that the specialists to whom Cyrus appealed were none other than the magi. In fact, their knowledge of the stones and plants used in medicine is attested in many ancient texts that explicitly claim to derive from their writings and their knowledge. Note the treatise *On Nature*, attributed to Zoroaster himself (!), or the teachings disseminated by the *magus* Ostanes, who, according to Pliny (*NH* XXX.8), accompanied Xerxes in Greece and who, Diogenes Laertius says, was left with other *magi* at Abdera as tutors for the philosopher Democritus. Pliny says that he himself took much of his information from this Pseudo-Democritus, and thus devotes numerous (highly polemical) digressions to the *magi's* knowledge of the curative properties of plants. The *magi* also knew about stones. One stone "is prescribed by Zoroaster" for epilepsy (Pliny XXXVII.157♦); other stones fought violence and hot temper or witchcraft (XXXVII.144–45♦).

Regardless of the many distortions this information has suffered over the course of time, there is hardly any doubt that much of it really does go back to medical practice during the Persian era. Pliny states several times that the use of various herbs was related to the "magical" abilities of the magi. For example, they used the *aglaophotis* "when they wish to call up gods" (XXIV.160♦); placed in a drink, the *theangelis* "to gain power to divine" (XXIV.164♦); certain stones allowed them to battle storms and tempests (XXXVII.142, 155); another stone is "indispensable for the Magi at the installation of a king" (XXXVII.147♦). They also knew herbs' curative powers and used them for the king's health:

The *theombrotion* grows, says Democritus, thirty schoeni [8 km] from the Choaspes, being like a peacock in its colourings and of a very fine scent. He goes on to state that the kings of Persia take it in drink for all bodily disorders and for instability of intellect and of the sense of justice, and that it is also called *semnion* from the majesty of its power (*a potentiae maiestate*). (XXIV.162)

This seems to have been a (purgative?) infusion. We also see that the magi's competence in herbalism went beyond health, strictly speaking. The herb Pliny talks about seems to have been reserved for the exclusive use of the king. Furthermore, he draws other benefits from it, even regarding his special capacities as sovereign. Pliny also records that the kings and *magi* made themselves look good with a curious ointment made of a Cilician plant, saffron, and lion fat (XXIV.165). Because of their abilities, the *magi* were fawned over. Pliny records, for example, that a certain herb allowed access to the inner circle of royal favor (*primatum apud reges*; XXIV.165) and that the use of a particular agate offered every chance of success "of petitioners to the king" (XXXVII.169♦)!

Added to other evidence attesting to the *magi's* functions—in ritual (p. 245), in education (p. 330), especially of the royal children (p. 521), and their continual presence before the king (whose dreams they interpreted), including accompanying him during the enthronement ceremony (p. 523)—the texts bearing on the "pharmacological" activities of the *magi* demonstrate again the central position that the *magi* occupied in the

court of the Great King. When Themistocles arrived at Artaxerxes' court, "by the king's command he also was made acquainted with the Magian learning (*hoi magikoi logoi*)" (Plutarch, *Them.* 29.6♦). We have the impression that at the Achaemenid court the *magi* took responsibility for the knowledge, practices, and prestige that at the Neo-Assyrian court had been the province of the Sages and the Literati ("Assyrian scholars"), who were divided into scribes, haruspices, exorcists, doctors, and singers.

3. The Eunuchs

On the Perfidy of Eunuchs

Out of all of the residents of the "oriental" palaces, there was one group of people who stimulated the imagination of European travelers and observers above all others: the eunuchs. They were usually reduced to one job, which could be identified with two words: "harem" guard. Traditionally, "oriental despotism" and the sovereigns' decadence have been attributed to the joint efforts of perverse women and perfidious eunuchs. Ancient Persia has not escaped this stereotype.

Ctesias certainly played a major role in entrenching this view. Every king in Ctesias's writings is flanked by one or more eunuchs, characterized as "the most powerful one(s) near King N": Petesacas, then Bagapates near Cyrus (§5, 9), Izabates, Aspdates, and Bagapates near Cyrus (§9). We find Artasyras in Darius's entourage (§19), Natakas and Aspamithres near Xerxes (§20, 27, 29), Artoxares near Artaxerxes I (§§39–40), and Pharnacyas near Secundianus (§45). Artoxares reappears near Artaxerxes II (§53), in whose entourage another eunuch also named Bagapates is known (§59). Generally speaking, Ctesias's presentation is wholly unsympathetic. The eunuchs participate in many conspiracies. Bagapates conspires against Cambyses (§13) before joining the Seven (§14), Aspamithres participates in Xerxes' assassination (§29), Pharnacyas in Xerxes II's (§45), Artoxares participates in a conspiracy against Secundianus (§47), which helps him become very influential with the new king Darius II (§49), before going on to conspire (aided by a woman!) against his master (§53). The faithfulness of Bagapates, "who died after keeping watch for seven years over Darius's tomb" (§19), appears quite exceptional. Finally, let us not forget Izabates, who denounced the conspiracy of the *magus* and was executed by the usurpers (§13).

Many of Ctesias's stories are pure fiction, especially the Egyptian expedition of the eunuch Bagapates, which allowed Ctesias to portray a battle between two eunuchs, in that Egypt itself was defended by Kombaphis, the head eunuch of Pharaoh Amyrtaeus (sic). Ctesias did not shy away from the most convoluted intrigues; for instance, he did not think twice about making Kombaphis the cousin of Izabates, another important eunuch at Cambyses' court (§9)! We have now entered the realm of imaginative fiction and fairy tale, not history, though paradoxically these flights of fancy are still of interest to the historian. Another very good story concerns the eunuch Artoxares, who had a false beard and moustache made so that he could lead a plot against Darius II. The symbolic weight of this tale is all the more noteworthy because, still following Ctesias (§53), it was a woman who helped him. The alliance of a eunuch and a woman in a court conspiracy could not fail to titillate readers, who were always eager for anecdotes based on "orientalizing" stereotypes.

Ctesias was not the only one to transmit such a negative stereotype. Quintus Curtius speaks "of a herd of eunuchs, who are not at all despised by these peoples" (III.3.23♦);

as for the 360 royal concubines, they were "attended by herds of eunuchs, also accustomed to prostitute themselves (*ipsi muliebria pati adsueti*)" (VI.6.8♦). Quintus Curtius's expression reminds us that, like some other ancient authors, he was particularly scandalized by stories circulating about homosexual relations between certain kings and their favored eunuch. Alexander's historians had much to say about Bagoas, "a eunuch of remarkable beauty and in the very flower of boyhood, who had been loved by Darius [III] and was afterwards to be loved by Alexander" (Quintus Curtius VI.5.23♦). To better express his disgust at these practices, Quintus Curtius puts this speech in the mouth of the Persian noble Orxines, who had just refused to pay his respects to Bagoas: "It was not the custom of Persians to mate with males who had made females of themselves by prostitution" (*qui stupro effeminarentur*; X.1.26♦). Pretty words that certainly do not correspond to reality—despite the polemic on this subject by the ancients, homosexual practices are attested among the Persians.

We also know of a eunuch named Tiridates, portrayed in a magnificent story told by Aelian in the course of a long digression on the fate of Aspasia, Cyrus the Younger's favorite companion, who switched to the camp of Artaxerxes II after the battle of Cunaxa:

Some time later the eunuch Tiridates died. He had been the most handsome and attractive man in Asia. He ended his days still a youth, emerging from childhood, and the king was said to be greatly in love with him. As a result he lamented bitterly and was in great distress; there was public mourning throughout Asia as a gesture to the king from all his subjects. No one dared to approach or console him. . . . When three days had passed, Aspasia put on mourning and, as when the king departed to the baths stood weeping, her gaze fixed on the ground. . . . The Persian was greatly encouraged by her sympathy and asked her to go to the bedroom and wait for him, which she did. When he came back he put the eunuch's cloak over Aspasia's black dress. Somehow the young man's clothing suited her, and her beauty struck her lover even more powerfully. Once overcome by this sight, he asked her to visit him in this attire until the severity of his grief waned. (VH XII.1♦)

How elegant and muted the telling! Delicious food for thought for psychoanalysts-in-training!

Plenty of wicked eunuchs are also found in Plutarch's writings, who takes some of his information from Ctesias himself, as well as from Dinon. The eunuch Sparimazes eggs Mithradates on in his bragging, the better to denounce him and destroy him (*Art.* 15–16). The eunuch Masabates, who cut off Cyrus's head, was won by Parysatis in a dice game with her son Artaxerxes; she calls Masabates an "old rascally eunuch" (17.8♦; cf. Ctesias §59: Bagapates). It is also a eunuch who guides conspirators to Artaxerxes II's bedchamber, though it is true that he first informs the king of the conspiracy (29.1–3). As in Ctesias (§29: Aspamithres), Diodorus's account includes a eunuch (Mithradates) among the conspirators who do away with Xerxes (XI.69.1). Felonious eunuchs are found in the book of Esther (2:21).

But the most famous example is Bagoas (not the same Bagoas mentioned above), whom Theophrastus calls "Bagoas the Elder (*ho palaios*)" (*HP* II.8.7) and whose portrait by Diodorus is disastrous to his memory (XVI.47–50; XVII.5): "A eunuch in physical fact but a militant rogue in disposition" (§5.3♦). During Artaxerxes III's Egyptian campaign, he manifested injustice and rapacity toward the priests and temples and broke promises given to the pharaoh's Greek mercenaries. He acquired the king's full confidence and in 343 he became chiliarch. After the victory, his influence over the king increased

further—he received the government of the Upper Satrapies (see p. 1002), and the king “no longer decided anything without his advice.” Bagoas thus became the veritable “master of the kingdom/kingship (*basileia*); he was king in all but name.” He soon assassinated Artaxerxes III and his brothers and installed the young Arses on the throne; his blows soon fell on the new king and his children, and he chose Codoman/Artašata to be king (Darius III), whereupon he was poisoned by drinking from the very cup he had just handed to the one he had elevated to the throne (p. 264)!

Indeed, Bagoas does not appear very sympathetic (to say the least!), and his behavior and career, as seen by Diodorus, were not a little responsible for entrenching the notion of Persian decadence in light of palace intrigue (cf. chap. 17/1). But it must also be observed that Bagoas truly became a character in the “oriental romance.” An echo is found in an anecdote told by Aelian (VII VI.8♦):

Artaxerxes, known also as Ochus, was the victim of a plot planned by the Egyptian eunuch Bagoas. They say he was killed, cut to pieces and fed to the cats. Someone else was buried in his place and laid to rest in the royal mausoleum. But Bagoas was not content with killing Ochus; he even made knife handles out of his thigh bones, displaying in this way his murderous instincts. He hated him because, like Cambyses before him, he had killed Apis during a visit to Egypt.

Many details of the story confirm the Egyptian provenance of the Bagoas romance, be it the Egyptian ethnic origin of the Persian or the role of cats. But the romance also includes a Greek layer: the comparison with Cambyses (impious murderer of the Apis, as in Herodotus) and perhaps also the transformation of Bagoas into a protector of Egyptian temples, even though he himself had ransacked them during Artaxerxes III's campaign (Diodorus XVI.51.2). The fact is that the nasty, bloody eunuch became a literary type in ancient romances. For instance, in the Judith romance, the name Bagoas is given to “the eunuch in charge of [Holophernes'] personal affairs” (Jdt. 12:11♦). Furthermore, according to Pliny (XIII.41♦), it was “the Persian word for a eunuch.”

Xenophon and the Paradigm of the Faithful Minister

Xenophon develops quite a different picture. His Cyrus was always anxious for his security and chose to entrust it to eunuchs. He explains this with the aid of arguments that seem to be designed to refute point by point the disastrous image these people had in Greece. First of all, the eunuchs had no family ties:

Those, therefore, who had children or congenial wives or sweethearts, such [Cyrus] believed were by nature constrained to love them best. But as he observed that eunuchs were not susceptible to any such affections, he thought that they would esteem most highly those who were in the best position to make them rich and to stand by them, if ever they were wronged, and to place them in offices of honour (*timai*); and no one, he thought, could surpass him in bestowing favours of that kind. (Cyr. VII.5.60♦)

Thus, eunuchs were free of any entanglements relating to family solidarity. This situation made them entirely dependent on a powerful master, toward whom they would be fully disposed to manifest unlimited devotion and loyalty. In fact—continues Cyrus/Xenophon—“inasmuch as eunuchs are objects of contempt to the rest of mankind . . . , they need a master who will be their patron” around whom they know they could achieve a place of honor (§61♦). Their fidelity was demonstrated above all upon the death of their master (§64). To some extent, in this highly hierarchical society, they represent *outsiders*.

Then Xenophon takes issue with the popular opinion that "eunuchs are weaklings." His basis for disagreeing with this notion is the example of animals: a gelded horse, for example, is "none the less fit for service in war." Similarly, eunuchs proved their courage, in both war and the hunt. Armed with a sword or a lance, a eunuch was as good as a man. "Recognizing these facts, [Cyrus] selected eunuchs for every post of personal service to him, from the door-keepers up" (*thyrōroi*; §62–65♦).

In the *Cyropedia*, the Gadatas romance is a lively illustration of the valor, fidelity, and courage of a castrato. Gadatas was a prince subject to the king of Assyria. For an apparently frivolous reason (though the real reason was thinly disguised political opposition), the king had Gadatas castrated (V.2.28). Gadatas then decided to defect to Cyrus and cooperate with him, turning over to him the strongholds he was in charge of in his own principality. He accompanied the army to Sardis and then Babylon. With Gobryas, he captured the town as head of a detachment (VII.5.24–32). He then operated from an exalted position; he participated in the great victory parade, leading a regiment of 10,000 horsemen (VIII.3.17). Shortly thereafter, Cyrus conferred the title "head of the scepter-bearers" (*skēptoukhoi*) on him:

The whole household was managed as he directed. Whenever guests (*syndeipnoi*) dined with Cyrus, Gadatas, did not even take his seat, but attended upon them. But when they were by themselves, he would dine with Cyrus, for Cyrus enjoyed his company. And in return (*anti touto*) for his services he received many valuable presents (*megala dōra*) from Cyrus himself and, through Cyrus's influence, from others also. (VIII.4.2♦)

It seems pretty clear that Xenophon's stories fit perfectly into the conception of kingship that he was developing throughout the *Cyropedia*: more than anyone else, a eunuch illustrated the theme of royal generosity in response (*anti touto*) to the unlimited devotion of a man who was not concerned about his children's prospects and who therefore exhibited the faithfulness of a pet because he was linked neither to a family clan nor to a court faction.

Xenophon undoubtedly derived his theme of the honest minister from oral tradition and edifying moral tales coming from the Near East. For example, the composers of one of these, the *Aḥiqar romance*, situate the story in an Assyrian context, because Aḥiqar is presented as the minister first of Sennacherib and then of Esarhaddon. The story is known in several versions, the most important being the Aramaic version (unfortunately incomplete), which is preserved on an Egyptian Aramaic papyrus from the Achaemenid period (DAE 106–8 [AP pp. 204–48]). The childless Aḥiqar adopted his nephew Nādin and had the king recognize him as his successor. His nephew betrayed him and denounced him falsely. Aḥiqar was arrested, but the servant who was ordered to kill him actually spared him, though leading the king to believe that he had carried out his mission (this theme of preservation/deception is frequent; it is also found in one version of the Cyrus legend). Then his innocence became known, and he was fully rehabilitated. In the moral precepts he gave his nephew, he stressed obedience and fidelity to the sovereign.

The theme of the falsely accused loyal servant reappears in another romance, known mostly from a Hellenistic-period version included in Lucian's *Dea Syria* (§§17–27). The Seleucid queen Stratonice, wife of Seleucus I, was preparing to undertake a voyage. The king designated his confidant Kombabos to watch over her. Kombabos was afraid that he would later be accused of entertaining illicit relations with the queen and amputated his

sexual organs and sealed them in a casket. Thus the (foreseeable!) passion the queen soon avowed toward Kombabos was not consummated. Nevertheless, Kombabos did not go unaccused upon Seleucus's return. Condemned to death by the king, he was able to prove his innocence by opening the casket. Overcome with admiration, the king bestowed the highest honors on him.

We find an allusion to the name Kombabos in Ctesias, who records that the pharaoh's favorite eunuch was called Kombaphis (§19). The word also appears in a hieroglyphic inscription recounting the career of an Egyptian, Ptah-hotep, who allied himself with Darius. The story is repeated in Firdawsī's *Book of Kings* (Shahnameh) in the medieval period. Grafted onto Mesopotamian antecedents, the Kombabos legend is none other than a court tale that had its origin during the Achaemenid period. It exalts both the characteristics of the implacable, just, and grateful sovereign and the unlimited fidelity of a eunuch-confidant. We are very strongly tempted to hear a distant, muffled echo in Xenophon.

The image of the faithful eunuch is also found in other authors. It was already explicit in Herodotus: "In eastern countries eunuchs are valued as being specially trustworthy (*pistis pasē*) in every way" (VIII.105♦). In Ctesias, Izabates denounces the conspiracy of the magi (§13), and Bagapates watches over Darius's tomb for seven years (§19). Herodotus presents Hermotimus, "who came to be valued by Xerxes more highly than any other of his eunuchs" (VIII.105♦). The king entrusted him with oversight of his children, who were returned to Asia Minor under the guard of Artemisia of Caria (VIII.107). During the battle of Cunaxa, Cyrus the Younger's eunuchs wailed, and "the most trusty (*pistōtatos*) of them, Pariscas, wept sitting by his corpse" (Plutarch, *Art.*, 12.1). One of Artaxerxes II's eunuchs, Masabates/Bagapates, severed Cyrus's head (17.1), another denounced a conspiracy to Artaxerxes II (29.1), and a third (Satibarzanes) brought water to Artaxerxes when he was consumed with thirst during the battle of Cunaxa (12.4), and so forth. Alexander's authors are also fond of the theme of the faithful eunuch. Darius III's mother's eunuch, Tyriotes, who was captured with many others during the battle of Issus, managed to escape and reach Darius's camp, where he stoically withstood torture (Quintus Curtius IV.10.25–34). One of Darius III's eunuchs dissolved in tears when Alexander mounted the throne of the Great King (Diodorus XVII.66.4–5; Quintus Curtius V.2.14). Even after Darius III's private guard had abandoned him, he remained surrounded by his eunuchs, faithful to the very end (Quintus Curtius V.12.9–13).

The historian clearly does not need to choose between Ctesias and Xenophon. Both views are stereotyped and popularized. Their existence and circulation evidence the ambivalence of both the eunuchs' status and the Greek authors' attitude toward individuals who alternately fascinated and repelled them. What must especially be assimilated from the preceding pages is that, on this topic, the historian must work with texts that are more like court romances than historical narratives.

Eunuchism and Emasculation

Given the nature of the sources, we can only reconstruct the Persian institution inferentially, and the reconstruction can only be partial. In the first place, we need to establish a distinction between the eunuchs who were part of the king's immediate entourage (portrayed by Ctesias in particular) and the many other anonymous eunuchs (the "herds of eunuchs" of Quintus Curtius III.3.23; VI.6.8; cf. Herodotus VII.186–87) who made

up the domestic staffs of the king and the royal princesses (e.g., Ctesias §§61–62; Plutarch, *Art.* 15.2; Quintus Curtius IV.10.18). Clearly, eunuchs were individuals whose status was close to slavery, even though their intimacy with the king or the royal princesses conferred a special degree of prestige on them. This fact must be kept in mind when reading what Plutarch has to say about the stakes in the dice game between Artaxerxes II and his mother Parysatis:

She pressed him to begin a new game for a eunuch, to which he consented. But first they agreed that each of them might except five of their most trusty (*pistōtatoi*) eunuchs, and that out of the rest of them the loser should yield up any the winner should make choice of. (17.6♠)

Like many other court servants, eunuchs came from subject countries (cf. Athenaeus XII.514d). We know that several regions had to furnish human tribute or gifts—boys and girls (500 boys every 4 years from the Ethiopians; 100 boys and 100 girls every 2 years from the Colchians; Herodotus III.97). Each year, Babylonia had to send 500 young castrated men to the court (*ektomiiai*; III.92). They could also be included as booty, to go by what Herodotus writes of a punishment pronounced against some rebellious Ionians: “Once the towns were in their hands, the best-looking boys were chosen for castration and made into eunuchs” (VI.32♠).

Because of the market for eunuchs at the satrapal and royal courts, trafficking between the Aegean coast and the inland countries was particularly heavy. Evidence is provided by the case of Hermotimus, who became the eunuch closest to Xerxes. He was a native of Pedasus in Caria who was taken prisoner during a war, then purchased by a man named Panionius of Chios, “a man who made his living by the abominable trade of castrating any good-looking boys he could get hold of, and taking them to Sardis or Ephesus, where he sold them at a high price” (Herodotus VIII.105♠). Caria was always famous for its eunuchs. According to Xanthus, the institution of court eunuchism was ancient in Asia Minor, since it was well attested in the Lydian court (Athenaeus XII.515e). However, the Near East certainly included other centers that served as sources of eunuchs as well.

The eunuchs watched over both the king’s chamber and the chambers of the royal princesses (cf. *Alex.* 30.2). This, by the way, is the etymology of the Greek word *eunoukhos* ‘guardian of the bed’. The common interpretation, ‘guardian of women’, is a folk etymology probably based primarily on Esther and on parallels with the Ottoman court. The book of Esther in fact portrays two “king’s eunuchs,” Hegai and Shaashgaz, both of whom bear the title ‘custodian of the women’ (*phylax tōn gynaikōn*; 2:3, 8, 14–15♠). We may presume, without actual proof, that these are castrated men. Except for a very fleeting allusion to eunuch-slaves in the service of the 360 concubines in Quintus Curtius (VI.6.8), the only “attestation” is found in Herodotus, in the Democedes romance: Darius sent a physician to the women, and he was escorted by eunuchs (III.130). It is surprising that Xenophon does not mention this task in his discussion of the relation between castration and fidelity. Of course, the wives and concubines of his Cyrus are completely absent from his story. It is also true that the eunuchs were not limited to guarding and maintaining the royal bedchamber; many also served the king during his meals (e.g., Aelian, *VH* II.17; Dinon apud Athenaeus XIV.652c).

Finally, if Plato is to be believed (*Alc.* 121d♠), there were also eunuchs who took care of the royal children:

Then the boy is brought up—not by some nanny of no account, but by the most highly respected eunuchs in the royal household. They attend to all the needs of the infant child, and are especially concerned to make him as handsome as possible, shaping and straightening his infant limbs; and for this they are held in great esteem.

However, the succeeding discussion makes it appear that the eunuchs were involved with the children only in their earliest years, after which their education was taken over by wise men, that is, *magi* (see p. 330). Here as elsewhere, the eunuchs (here palace slaves) were limited strictly to physical needs. None of them, not even Hermotimus (contrary to what is sometimes said), was charged with the education of the Great King's son.

Title and Duties

It is highly unlikely that all of the people later called eunuchs were actually emasculated slaves. While Hermotimus's unmanning is certain (Herodotus VIII.104–5), serious doubts may be entertained regarding other slaves, especially the so-called eunuchs close to the king. Ctesias tells the story of the eunuch Artoxares, the most powerful of the three eunuchs of the royal entourage (§49), who in his conspiracy against the king “had a woman make a false beard and moustache to give him the appearance of a man” (§53). But not even this story (whatever its veracity may be, no doubt close to zero) proves that he had been emasculated: we know in fact that the king and all the court nobility wore hairpieces. Artoxares may thus have simply procured the collaboration of one of the women who took care of the “court” beards and moustaches to acquire the appearance not of a man but of the king. In the same way, there is nothing to prove beyond the shadow of a doubt that the smooth-faced figures in the Persepolis reliefs (or the Assyrian reliefs) should be identified as eunuchs.

The case of Mithradates, who participated in the plot against Xerxes alongside the chiliarch Artabanus, is even more interesting. Ctesias portrays him (under the name Aspamithres) as highly influential with the king (§29). Diodorus specifies that he was the chamberlain (*katakoimistēs*) in whom the king had the greatest confidence, and he made him the friend and kinsman (*syggenēs*) of Artabanus (XI.69.1). Artabanus was himself the son of Artasyras, a very powerful man close to Darius (Ctesias §19–20). This Artasyras is clearly the same one whom Ctesias calls a Hyrcanian and who was the most influential figure under Cambyses (§9). It is thus virtually certain that he was a noble of Hyrcanian origin, comparable to the Aribazus known during the time of Darius (Aelian, VH VI.14). This reference indicates at the very least that certain eunuchs were not without family connections in the palace, contrary to the hopes that Cyrus/Xenophon placed in the castrated eunuchs. It seems rather unlikely that the kinsman and friend of a palace aristocrat would be a castrated slave. Equally striking is the fact that, except in the case of Hermotimus (a case that was inserted by Herodotus into its specific geographical-cultural context), nearly all of the eunuchs mentioned by name have Iranian names. For this there are two possible explanations: either they really were eunuchs who were given Iranian names when they arrived at court, or else they were Iranian nobles integrated into the court hierarchy by being given the label “eunuch.” In at least some cases they seem to have been people of non-Persian origin: in addition to Mithradates, we may cite Artoxares, who Ctesias says was Paphlagonian (§39).

It seems doubtful that eunuchs in the functional sense (castrated men of humble status) could have obtained positions as high as the eunuchs mentioned by Ctesias and still

more surprising that one of them (Artaxerxes III's Bagoas) could have received the coveted title of chiliarch. Even the title 'chamberlain' (*katakoimistēs*) lent its holder a position of favor near the king. One chamberlain, Satibarzanes (was he Artaxerxes II's eunuch—Plutarch, *Art.* 12.4—or a different one?), advised Artaxerxes II or at least was in his inner circle (cf. Plutarch, *Mor.* 173c and Ctesias §63). It is tempting to think that such an important man would not actually have attended to the king's chamber. The daily work was restricted to the palace eunuchs (cf. Plutarch, *Alex.* 30.2), whom Xenophon describes as "bath-room attendants . . . chamberlains who assist them in retiring at night and in rising in the morning, and beauty-doctors" (*Cyr.* VIII.8.20♦). According to this theory, men like Mithradates and Satibarzanes held a title completely unrelated to the duty it literally represented, as is often true in court hierarchy. On the other hand, the case of Hermotimus seems to contradict this interpretation. However, Herodotus actually says nothing about Hermotimus's functions in relation to Xerxes. He clearly had low status (he had been castrated and sold in Ionia). Despite the phrase used ("valued by Xerxes more highly than any other"), it is not at all certain that he held the same rank as the eunuchs portrayed by Ctesias, since the formula is frequently used for palace eunuchs who were clearly not high court dignitaries (e.g., Plutarch, *Art.* 17.6).

Most often, the ancient authors do not recognize any particular function for the eunuchs of the royal entourage; they simply highlight the hierarchy that distinguished them in regard to royal favor. There are two noteworthy exceptions, however: Mithradates was Xerxes' chamberlain (Diodorus XI.69.2), and Bagoas was chiliarch in Artaxerxes III's court (XVII.5.3). Generally speaking, the position or duties they held easily explain why they were involved in so many conspiracies. They were among the few persons at court with entrée to the royal apartments. This was obviously true for the chiliarch, who was in charge of royal audience (§2 above), but more generally for the eunuchs who guided the conspirators toward the royal bedchamber. Bagapates had all of the keys to the palace, Ctesias writes (§14). Herodotus also reports, describing the conspiracy of the Seven, that when the Seven arrived at the palace courtyard they ran into "the eunuchs—the king's messengers," who attempted to bar the way to the *magus's* bedchamber (III.77). Ctesias indicates that, in order to obtain an audience, one needed to be assured of the support of a eunuch. This is why eunuchs often appear in the court romances (Ctesias = Athenaeus XII.528f).

Only rarely do we see eunuchs outside of this role. Ctesias mentions two eunuchs who led military expeditions—Bagapates in Egypt (§9) and Nautacas against Apollo of Didyma (§27)—but the former is invention pure and simple. The only indisputable example is the participation of Bagoas in the Egyptian expedition alongside Artaxerxes III (Diodorus XVI.47–50). He was there because of his status as chiliarch, however, not as a eunuch *per se*. More than once, Ctesias portrays a eunuch as being entrusted with guiding the funeral chariot of the deceased king to the royal tombs: Bagapates for Cyrus (§9) and Izabates for Cambyses (§13). In each case he was the deceased king's favorite eunuch. On one occasion it was a Persian nobleman (not called a eunuch) who had this charge (§§44–46). The case of Batis is also interesting: Darius III entrusted him with the defense of the garrison of Gaza (phourarch in Josephus, *Ant.* XI.320). An ancient tradition, recorded by Arrian (II.25.4) and the author of the *Itin. Alex.* (§45), refers to him as a eunuch. But on coins he is called "king of Gaza." It is likely in this case that the word *eunuch* is a corruption of a title.

Placing the sources in juxtaposition brings out the fact that the ancient authors sometimes used the term *eunuch* for persons who clearly were not. Thus Artapates, "the one among Cyrus' [the Younger's] chamberlains (*skēptoukhoi*) who was his most faithful follower" (Xenophon, *Anab.* I.8.28), was certainly not a eunuch, contrary to Aelian's statement (*VH* VI.25), for which, curiously, he credits Xenophon. Perhaps he read in the *Cyropedia* that Gadatas, the head of the *skēptoukhoi* of Cyrus the Elder, was a eunuch (*VIII*.4.2)—unless Artapates also held the title of eunuch.

It is rather tempting to think that there were two kinds of eunuch at the Persian court: (1) the castrated men, reduced to palace slavery and used in specific contexts (at a higher or lesser rank in the domestic hierarchy); and (2) the eunuchs in the sense of the court hierarchy, that is, nobles (Persian or Iranian) in the king's immediate circle who differentiated themselves according to their own hierarchy (as Ctesias explains several times). At any rate, if we reread Xenophon closely, it seems that Cyrus's castrated men only fulfilled subordinate duties, which acquired importance only because of the king's vulnerability (table, bath, bed; *Cyr.* VII.5.59). They were all servants, "from the doorkeepers up (*thyōroi*)" (§65♦), that is, probably the guardians of the gates of the private apartments. This was apparently the function devolving on the eunuchs who are called porters (*janitores*; Vulgate) or chief bodyguards (*arkhisōmatophylakai*; Septuagint) in the book of Esther (2:21). The prevailing impression is that Xenophon and Ctesias were not talking about the same eunuchs. Xenophon deals with the royalty's use of eunuchs who were sent to the court each year by subject peoples, just as the young Babylonians who were emasculated for this purpose (Herodotus III.92). Ctesias portrays aristocrats bearing a court title that the Greeks, rightly or wrongly, understood to be "eunuch."

All of this leads us to suspect that in many cases those whom the Greek texts call eunuchs were nothing other than the holders of high court positions in the king's entourage. It is in fact fairly likely that, as in the Assyrian court, the word had become a court title that did not refer to any particular physical characteristics. The real problem, obviously, is that we do not know the Persian vocabulary. The Greek vocabulary itself remains uncertain: which Persian word does *eunuch* indicate? It turns out that sometimes copyists confused *oinokhoos* 'cupbearer' with *eunoukhos* 'eunuch', as in the case of Nehemiah. In Hebrew, the usual term is *sārîs*, which is borrowed from the Akkadian *ša rēš šarri*, that is, 'he who is stationed at the head of the king'. This is the word that is regularly rendered *eunuch* in the Septuagint of Esther. For more than a century, the debate has raged among Assyriologists as to whether this class of persons automatically consisted of castrated men. The arguments are nearly identical to arguments that can be made regarding the eunuchs of the Achaemenid court. To interpret *ša rēš šarri* consistently as 'eunuch' leads to a sort of absurdity, as P. Garelli has humorously expressed it: "Is it necessary to castrate half the Assyrian administration and nearly everyone at court?"

We must stress at this point that there are several (often unappreciated) interesting Egyptian documents from the Achaemenid period. The word *saris* is found in several hieroglyphic inscriptions from Wadi Hammamât from the time of Darius and Xerxes. An important Persian administrator there, Atiyawahy, bore the title "*saris* of Persia" (Posener nos. 24–30). He was definitely not a eunuch; *saris* here refers to a high official similar to the powerful minister Potiphar in Genesis 37:36, 39:1 (the title *saris* is translated *dynastēs* 'powerful' in the Greek of the Septuagint). It is possible that the Egyptian title "powerful of Persia" given to Ariyawrata, brother of Atiyawahy, was a "translation" of

the word *saris* (Posener no. 34). This is certainly the most convincing testimony, because the Wadi Hammamât inscriptions were not composed without the consent of the persons they honored. If the Persians adopted the foreign word *saris*, would it not have been because it was used at court, no doubt in its Akkadian form? This would be the same word as the word consistently translated into Greek as 'eunuch', perhaps simply because in the everyday speech of Babylonians during the time of Ctesias and other authors of *Persicas* the word would have retained the connotation of a powerful official, long after it had lost its proper institutional or biological definition. A sort of empirical verification of this hypothesis can be deduced from a well-known Babylonian text, the *Dynastic Prophecy*, which alludes to the murder of Arses: "A ša rēš [will kill] this king" (BHILT 35). This obviously refers to Bagoas, who is regularly called a eunuch in the Classical sources; we know that Bagoas was a high palace official, since he held the title of chiliarch.

To conclude briefly: there is no doubt about the existence of castrated men at the Achaemenid court. The Classical texts are absolutely clear on this point. In most cases, they worked as a part of the palace's immense domestic staff, without our being able to determine precisely whether they were assigned specific tasks. The only exception is that they guarded a particular category of women (called royal *pallakai* by the Greeks), regardless of whether one accepts or rejects the traditional term *harem* (see the next section). It is moreover highly doubtful that all of the counselors and intimates of the Great Kings whom Ctesias and others call eunuchs were castrated men. The most reasonable hypothesis is to accept that *eunuch* is how the Greeks transmitted a term that the court of the Great King considered a court title. The evidence of the Wadi Hammamât inscriptions suggests that, based on the model of the Neo-Assyrian court, this title was ša rēš šarri (*saris*).

4. The Women's Side

Wives and Concubines

We know from many examples that the kings, like other Persians, practiced polygamy and that they also had many concubines. In the Persian context, a distinction between the categories of legitimate wife and concubine is often made by the ancient authors, such as Herodotus:

Every man has a number of wives (*gynaikes*), and a much greater number of mistresses (*pallakai*). (I.135)

or Plutarch:

When the Persian kings take their dinner, the lawful wives (*hai gnēsai gynaiques*) of the Persian kings sit beside them at dinner, and eat with them. But when the kings wish to be merry and get drunk, they send their wives away, and send for their music-girls and concubines (*mousourgoi kai pallakides*). In so far they are right in what they do, because they do not concede any share in their licentiousness and debauchery to their wedded wives (*gametai*). (Mor. 140b♦)

We can also quote Dinon (apud Athenaeus):

Among the Persians the queen tolerates the large number of concubines (*pallakides*) because the king rules his wife (*gametē*) as absolute owner, and for another reason, according to Dinon in his *History of Persia*, because the queen is treated with reverence by the concubines; at any rate they do obeisance (*proskynesis*) before her. (Athenaeus XIII.556b♦)

In Ctesias's version of the initial relations between the Persian court and the Saite pharaohs, he records that Amasis refused to send one of his daughters to Cambyses, "suspecting that she would not have the station of a wife (*gynaix*) but that of a concubine" (*pallakis*; Athenaeus XIII. 560d↔). The story narrated by Xenophon (*Ages*. 3.3) concerning relations between Pharnabazus and Spithridates confirms this point: Spithridates became quite annoyed with Pharnabazus, who was hoping to marry (*gēmai*) one of the king's daughters and was planning to take Spithridates' daughter without marrying her (*aneu gamou*)—that is, we are given to understand that he wanted to take her as a concubine. This manifested considerable disrespect for the girl's father.

The category of "wife" was distinguished from the category of "concubine" by means of an official ceremony and was manifested in the status of the children. The wives bore legitimate children (*gnesioi*), the concubines illegitimate (*nothoi*). In principle, only the former entered into the limited circle of potential heirs (Herodotus III.2). A notable exception occurred in the succession of Artaxerxes I: his wife Damaspia provided only one living legitimate son (*gnēstos*), Xerxes II, the others having died (Ctesias §44). When Xerxes II was assassinated soon after attaining the throne, competition emerged among the *nothoi*, the sons of several Babylonian women (Ctesias §§44–48). In this case, the institution of concubine perfectly met the objectives of polygamy and possessing multiple concubines (*pallakai*), as Strabo puts it: "For the sake of having many children" (XV.3.17↔). The existence of concubines is also "attested" by Ctesias during the reign of Bardiya, since in his tale the *magus* was killed by the Seven while "he was sleeping with a Babylonian concubine" (§14: *pallakē*).

Pallakai and Domestic

But who were these concubines? Or rather, who were these women whom the Greeks murkily call *pallakai*? In the Greek context, the internal differences are well marked, as a famous passage of Demosthenes indicates (C. Neera 122): "The courtesans (*hetairai*) we have for pleasure; the concubines (*pallakai*) for everyday cares; the wives (*gynaikes*) to have a legitimate descendant (*gnēsios*) and a faithful guardian of the hearth." For the female population of the Persian palaces, however, the Greek authors use the word *pallakis/pallakides* nearly uniformly; they use the word *hetaira* very rarely. Let us note meanwhile that in Athenaeus a distinction is made between Cyrus the Younger's two Aspasiae: the first, originally called Milto, is called a *hetaira*; the second (the heroine of the romance) is a *pallakis* (XIII. 576d). The notorious Thais, supposedly responsible for the burning of the palace at Persepolis in 330, is also called *hetaira* (*ibid.*).

As Aelian notes regarding the heroine of the romance, the four Greek girls who were introduced to Cyrus the Younger's court received a *hetaira's* (*hetairika*) education; that is, women of the profession taught initiates to make themselves up, to act a bit coy with men who got together to drink, and undoubtedly to sing and play instruments (harp, flute) as well. It was exactly the reserve of the young, beautiful Aspasia that so seduced Cyrus and prompted him to add her to his concubines (VH, XII.1). She came from a poor family, raised by an indigent (*penetēs*) father, Hermotimus. Since the four girls were brought to Cyrus by someone Aelian calls one of his "satraps," who was also her buyer (*agorastēs*), we may presume that they had been sold in a market; the other three girls behaved as though they had been (*kapēlikōs*). Plutarch also speaks of "these women whom the Persians buy for money and make their concubines" (*pallakai*; *Them.* 26.4; cf. Herodotus I.135). Straton of Sidon brought many *pallakai* from Ionia and all over

Greece, and they enlivened his banquets (Athenaeus XII.531b). In Asia Minor (and elsewhere), then, there certainly existed veritable "finishing schools," just as there were centers for the production of eunuchs. There were women who specialized in professional singing and music, and as such they had good reputations in the royal and satrapal courts (see pp. 293f.).

The example of Aspasia shows that one could advance from purchased slave to concubine. This theme recurs in several court romances. The powerful desire of the king for Esther can be paralleled with the story of Aspasia and Cyrus:

She was very soon preferred to his other mistresses because of her natural manner, reserved disposition, and unstudied beauty. . . . From that time on Cyrus had a greater liking for her than any of the other women he had dealings with. Later he fell very much in love with her, and she returned his affection. The love of the pair reached such a point that they were near to being equals and did not fall short of the harmony and morality of a Greek marriage. His love for Aspasia was celebrated in Ionia and the whole of Greece. (Aelian, VH XII.1♦)

Cyrus is so perfectly Hellenized by the storyteller that he was, "contrary to Persian custom (*ou persikōs*), exceedingly pleased with her nobility"!♦ But after all, as everyone knows, life is not very far from fiction, nor kings from men. Does not Herodotus record that, out of all of Darius's legitimate wives, he maintained a special affection for Artystone, in whose honor he had a statue erected (VII.69)?

Most *pallakai* were brought to the palace or the Persian nobles' households as prisoners of war. After the capture of several Ionian towns, "the handsomest girls were dragged from their homes and sent to Darius' court" (Herodotus VI.32♦) by the Persian generals; after the fall of Miletus, "the women and children were made slaves" (VI.19♦). A woman from Cos became the concubine of the Persian Pharandates "by force" (IX.76♦), and a Macedonian woman was taken from Samothrace to Autophradates the same way (Plutarch, *Mor.* 339e). After the Egyptian campaign, a soldier in Cambyses' army sold a female prisoner in Babylonia. After Sidon was taken, in 345-344, Artaxerxes sent a large number of women to Babylon, and the *Babylonian Chronicle* provides this detail: "They entered the king's palace" (ABC no. 9, 11.6-8). But not all were destined for concubinage in the true sense. They disappeared instead into the huge domestic staff of the palace; the Babylonian texts call these people *arad šarri* 'royal slaves' and *arad ekalli* 'palace slaves'. The women and girl captives without special training worked in various parts of the palace.

They might also join the staffs of the wives and princesses, who were provided with a large number of servants, as shown by the example of Darius III's mother (Diodorus XVII.38.1: *therapeia*). This is presumably the sense of the words that Herodotus places on the lips of Atossa, who wanted Darius to go to war with the Greeks: "I should like to have Spartan girls, and girls from Argos and Attica and Corinth, to wait upon me" (Herodotus III.134♦). The royal concubines themselves had many maids at hand; this is how Esther received "seven special maids from the king's household" (Esther 2:9♦).

There was another method of procuring women. It is explained by the author of the book of Esther. Let us recall that in this court romance Ahasuerus decided to repudiate Queen Vashti, who was guilty of not having attended the royal convocation. In order to find her replacement, he published the following royal order everywhere:

Let beautiful girls be selected for the king. Let the king appoint commissioners throughout the provinces of his realm to bring all these beautiful young virgins to the citadel of Susa. (2:2-3)

Despite the romanticized character of the work, this method of gathering women does not seem outside the realm of possibility. The motif recurs in a story told by Herodotus to show how Darius dreamed of repopulating Babylon after finally taking it at the end of a very long siege:

I mentioned at the beginning of my account how the Babylonians strangled their women to save food, and it was in consequence of this that Darius, in order to prevent the race from dying out, compelled the neighboring peoples each to send a certain stated number of women to Babylon. In all, as many as fifty thousand were collected there. (III.159♦)

This again is a "good story" rather than history. Nevertheless, it is woven within a perfectly acceptable political-institutional framework. All Darius did was set up a tribute assessment calculated in proportion to the available resources (in women) in each of the countries taxed. Tribute in human females is attested by Herodotus with regard to Colchis, which had to send 100 young boys and 100 girls to the court each year (III.97). In a way, the royal bed, like the royal table, reflected the immensity of the Empire and the diversity of the populations that it comprised.

On this point, I cannot resist quoting R. H. van Gulik on the concubines of the emperor of China during the T'ang period:

It would seem that the Palace women consisted of girls offered as tribute, both by the Provinces and foreign and vassal countries; of daughters of prominent families keen on obtaining the Imperial favour; and of women recruited by Palace agents. The Palace agents used to scour the entire Empire for beautiful and accomplished women, and apparently took them wherever they found them, not despising even commercial or government brothels. When a number of such women had been collected, the eunuchs and *duennas* sorted them out. The best were chosen for the Imperial harem, those skilled in the arts for the *chiao-fang* ['training center'], and the remainder assigned menial tasks in the Palace. (p. 184♦)

But, we must insist, the comparison is shaky, to the extent that the Achaemenid evidence is so sparse. In addition to the book of Esther, we at least can quote Phylarcus, who spoke in this way of a woman named Timosa: She "surpassed all other women in beauty. This girl had been sent as a present by the king of Egypt to Statira, the king's [Artaxerxes II's] wife" (Athenaeus XIII.609♦). She then became Oxyarthes' *pallakis*. Most likely he was infatuated with her and asked his sister-in-law to grant him her lady-in-waiting.

The Great King's 360 Concubines

A real problem arises with the usual interpretation of certain Classical and Hellenistic texts on the number of royal concubines. Plutarch, (Art. 27.1), Diodorus (XVII.77.5), Quintus Curtius (III.3.24; VI.6.8), and Dicaearchus (Athenaeus XIII.557b) mention the existence of 360 concubines for Artaxerxes II and Darius III.

The figure 360 is found several times in Herodotus's account about the paying of tribute: the third and twelfth nomes pay 360 talents of silver (III.90,♦ 92); the twentieth (India) annually sends 360 talents of gold powder (III.94). The figure even appears twice regarding the Cilician nome: out of the total of 500 talents of silver demanded, 140 went to maintain the cavalry permanently stationed in their country, the other 360 being sent to the royal court. Additionally, the country had to supply 360 white horses; Herodotus adds the following detail: "one for each day in the year," an expression also found in Diodorus regarding the royal concubines. The comparison of the texts leaves no doubt

about the existence of an ideal model, but was it Greek or Persian? Or, more precisely, was there any particular preference for the number 360 in Achaemenid thought? If not, we would have to toss out not only the number of concubines of the Great King but also Herodotus's figures concerning Achaemenid tribute. We would also have to reject Herodotus's story of the punishment that Cyrus inflicted on the Gyndes River, in which a white horse, which had been dedicated to the Sun, drowned: he divided it into 360 tiny streams and thus crossed it easily (I.189–90). We would also have to question the presence of 365 young men in Darius's procession, "equal in number to the days of a whole year" (Quintus Curtius III.3.10♦), as well as the variety (360) of uses the Persians had for the palm tree (Strabo XVI.1.14).

Obviously, this is a symbolic number that is also found in Greek tradition. But it also seems clear that in Persian tradition reference was being made to a solar calendar of 360 days plus 5 epagomenal days that coexisted with the official administrative calendar of the Babylonian lunar type. Some of the texts that include the number 360 (or 365) are situated directly or indirectly in a context of sun worship, especially the horses sacrificed annually during the *Mithrakāna*. It thus becomes apparent that the quantity of 360 concubines attributed to the Great King goes straight back to information from the Achaemenid court (cf. *nomos persikos* in Diodorus). By settling on the number 360 concubines, they once again gave the Great King the image of a man above men because of a perfect proportionality between his own rhythm and cultic time. Thus, more than anything, it was a number pertaining to the sacred character of Achaemenid kingship.

The privileged status of these 360 women is well illustrated by the ancient authors. Custom has it, Diodorus says, that during the relocations of the court the king was accompanied by the women of the Royal House and also by those of the Kinsmen and Friends (XVII.35.3). In Darius III's procession, Quintus Curtius mentions only the king's mother and wife, accompanied by a crowd of mounted women; following were the king's children and their governesses, as well as a crowd of eunuchs. "Next rode the 365 concubines of the king, regally dressed and adorned" (III.3.24♦). We also know from Heraclides that the concubines accompanied the Great King on hunts (Athenaeus XII.514c). This reproduces the custom described by Quintus Curtius (VIII.1.28) for the court of the Mauryan king (Strabo states that the concubines participated in hunts; XV.1.55). The 360 royal concubines constituted an integral part of the king's suite, though definitely at a rank inferior to the blood-related princesses. There can hardly be any doubt, therefore, that out of all whom the ancient authors called "concubines," the 360 royal concubines constituted a group with greater status than the immense horde of palace *pallakai*. We may presume, though without absolute proof, that at the king's death, 360 new concubines were recruited. What became of the earlier group? We know that to humiliate his son Darius, Artaxerxes II banished Aspasia: "he consecrated her priestess of Diana of Ecbatana, whom they name Anaitis, that she might spend the remainder of her days in strict chastity" (Plutarch, *Art.* 27.4♦). But it would be too hazardous to take this episode as a specific illustration of a general practice.

Furthermore, we do not know the criteria by which the concubines were selected. They are always characterized by uncommon beauty. This is already mentioned by the composer of the book of Esther, who adds that they were virgins. Diodorus says explicitly that they were beautiful: They were "outstanding in beauty as selected from all the women of Asia" (XVII.77.6♦). "Selected for their beauty," comments Plutarch in turn

(Art. 27.2◊). But this is hardly a distinguishing feature. Timosa and Aspasia are described in the same terms, and so is Amytis, Xerxes' sister and Megabyzus's wife: "Anou-tis was the most beautiful of all the women in Asia" (Athenaeus XIII.609a◊). And we recall Alexander's wondering appreciation of the Iranian women: "jestingly . . . terrible eyesores" (Plutarch, *Alex.* 21.10)!

It is difficult to answer the question of selection criteria because the royal concubines are usually mentioned collectively. We know the names of only three of Artaxerxes I's concubines, the ones who bore him children. Smerdis had a concubine who was referred to as a Babylonian (Ctesias §14); similarly, Ctesias refers to Artaxerxes I's concubines as Babylonian, despite the fact that one of them had a good Iranian name, Alogune, which means 'rose-colored'. If they really were among the 360 royal concubines (which is not certain), we may presume, with Diodorus and the composer of Esther, that they were recruited from the subject peoples and princes of the Empire. It seems unlikely, however, that any of them came from the great Persian aristocratic families, considering the indignant reaction of Spithridates, who broke with Pharnabazus on the grounds that he "intended to take his, Spithridates', daughter as a concubine" (Xenophon, *Ages.* 3.3).

The Great King's Sex Life: Images and Realities

One picture of the king's private life comes to us from Diodorus, who describes the following scene: "Each night [the concubines] paraded about the couch of the king so that he might select the one with whom he would lie that night" (XVII.77.7◊). The text implies that each night a new concubine joined the Great King in bed.

Compare the picture presented in the book of Esther. Once Esther arrived at Ahasuerus's court, the eunuch Hegai provided her with perfumes and food and also procured seven select girls for her "from the king's household" (2:9◊)—"concubines" in the sense of domestic staff. For twelve months Esther followed the "regulations for the women"; for six months she was anointed with myrrh and for six months with "spices and lotions commonly used for feminine beauty treatment." When she was summoned by the king, she left in the evening and returned in the morning, but she then stayed in "another harem entrusted to the care of Shaashgaz, the king's eunuch, custodian of the concubines." (2:12–14◊). In theory she would not reappear before the king unless he specifically requested her. Fortunately for the story, this did not fail to happen, for Esther was preferred above all others!

Be that as it may, the preparations required of the girls were probably not fictional. They are found in the book of Judith, when the heroine prepares to join Holofernes:

Taking off her widow's dress, she washed all over, anointed herself with costly perfumes, dressed her hair, wrapped a turban round it and put on the dress she used to wear on joyful occasions. . . . She put sandals on her feet, put on her necklaces, bracelets, rings, earrings and all her jewellery. (10:3–4◊)

It is not surprising that this sort of preparation was required of women who were about to share the king's bed. The youths who served at the king's table also had to take a bath and wear white clothes, according to Heraclides (Athenaeus IV.145b).

Thus, we see that Diodorus and Esther harmonize fairly well, although the romance does not mention the picturesque promenade featured by the chronicler. But does the modern historian necessarily find this similarity convincing? In an attempt to answer this question, let us turn to Heraclides, who wrote in his *Persica*:

Three hundred women (*gynaikes*) watch (*phyllatousin*) over him. . . . These sleep throughout the day in order to stay awake at night, but at night they sing and play on harps continually while the lamps burn; and the king takes his pleasure of them as concubines (*pallakides?*). [These were admitted to his presence] through the court of the Apple-bearers (*mēlophoroi*). (Athenaeus XII.514b♦)

At first glance, the similarity between Diodorus and Heraclides seems quite pronounced. But we do well to emphasize at the outset that the text is partly restored and that the word *pallakides* is uncertain; other manuscripts have *pollakis* 'often'. The only indisputable word is *gynaikes*. The usual proposals for restoration (sometimes including 360 instead of 300) are based on assimilation to Diodorus, which obviously gives rise to serious doubts regarding the probative value of comparison between the two authors. Diodorus does not mention details given by Heraclides (alert women who sing and play). These differences are all the more noteworthy in that Heraclides was quite familiar with the customs of the Achaemenid court.

The most likely interpretation is that Heraclides is here alluding not to the king's 360 concubines but to the playing and singing *pallakai*, some of whom ornamented the royal dinner with their voices and their harmonies, as we know from Heraclides himself (Athenaeus IV.145c) and other authors. Parmenion seized 329 of these *pallakai basilikai mousourgoi* in Darius III's Treasury in Damascus (XIII.608a). If this interpretation is legitimate, then we are led to believe that Diodorus (or his source) either embellished the story for his readers and/or (intentionally or not) confused facts such as those given by Heraclides. His descriptions integrate perfectly well with one of the favorite images of the Greek authors. As proof of the Great Kings' extreme luxury, Polyarchus did not hesitate to emphasize, for example, their penchant for sexual relations (Athenaeus XII.545f). Another writer, Aelian, compared them to a certain fish in the sea "that has many wives." The Median and Persian barbarians, he wrote, "exhibit their luxury (*trypḗ*) in the pleasures of the bed" (*Anim.* I.14).

It is not easy to distinguish fact from Greek interpretation here. From the number of royal concubines ("the same as the days in the year"), Diodorus draws the conclusion that they took turns in coming to distract the Great King. However, the available texts do not require us to take Diodorus's interpretation literally. We are especially tempted to think that this is how he "rationalized" a number that had supreme symbolic value for the Achaemenids. Perhaps Diodorus's view also derives, at least in part, from Herodotus's detail about relations between the Great King and his women: "In Persia a man's wives (*gynaikes*) share his bed in rotation" (III.69♦). All things considered, if as stated in Esther the girls who were recruited had to be virgins, we may even wonder whether many of them remained virgins even while a part of the harem—and then, perhaps, living in the chastity of a sanctuary of Anāhita (Plutarch, *Art.* 27.3–4).

Cloistered Women? The Myth of the Harem

In conjunction with the Classical texts, the text of Esther has played no small part in giving rise to the idea of a harem at the Great King's court, a harem that is described, or rather imagined, as being similar to the picture of Ottoman harems, peopled with eunuchs and concubines. This sort of presupposition guided the original investigators of Persepolis, who believed that they had discovered a harem—that is, a separate building where the women supposedly lived in individual chambers.

Undoubtedly, the royal princesses and wives generally had their own apartments. In his tale of the murder of Smerdis, Herodotus speaks of the men's apartment (*andreōn*)

(III.77–78), which obviously was separate from the apartments reserved for the women (III.68). The existence of separate apartments is implicit in his story about Democedes' arrival at the court: the Greek physician was taken by a eunuch to the king's wives (III.130: *para tas heautou gynaikas*). Note also Herodotus's detail on Persian infants: "Before the age of five a boy lives with the women (*para tēsi gynaixi*) and never sees his father" (I.136♦).

Speaking of the 360 royal concubines, Plutarch adds the following detail:

The barbarian people keep a very jealous and watchful eye over their carnal pleasures, so that it is death for a man not only to come near and touch any concubine of his prince, but likewise on a journey to ride forward and pass by the carriages in which they are conveyed. (Art. 27.1)

This reminds us of Themistocles' ruse, a tale also told by Plutarch. Once again stressing the jealousy of the barbarians (also noted by Aelian), Plutarch tells how, in order to escape the checkpoints, Themistocles climbed into a covered chariot. Those with him took advantage of the custom of concealing the women and would always say "that it was a woman of Greek origin whom they were taking from Ionia to one of the nobles of the king's Gate." Plutarch specifically comments:

The barbarous nations, and amongst them the Persians especially, are extremely jealous, severe, and suspicious about their women, not only their wives (*hai gamētai*), but also their bought slaves and concubines (*pallakai*), whom they keep so strictly that no one sees them abroad; they spend their lives shut up within doors (*oikoi*), and when they take a journey, are carried in closed tents, curtained on all sides, and set upon a wagon (*harmamaxai*). (Them. 26.5♦)

Plutarch, who was always concerned with the virtue of women, returns to it in his *Life of Artaxerxes*, stating that Artaxerxes was the first to allow his wife, Stateira, to travel in an open carriage (Art. 5.6; cf. *Mor.* 173f). He also states that the king's legitimate wives left the hall at the time of the *symposion* ['drinking party'], after attending a banquet; at this time, the concubines and musicians entered (*Mor.* 140b).

There is no good reason to reject the information in the Classical authors totally, however much they may have embellished the details (cf. Herodotus V.18). At the same time, we need to add important qualifications: we must not toss all the women in the palace into a single, undifferentiated category. We do not know much about the life of the royal concubines. The composer of the book of Esther places them in a house called the *gynaikōnos*. There were two houses of this kind, one (run by the eunuch Hegai) where the girls were prepared; the other, "the second women's house" (run by Shaashgaz, "custodian of the royal concubines"), where the women resided after their night with the Great King (2:2–17). Plutarch uses this Greek word when he refers to the satrap of Sardis's concubines (Them. 31.2). Aelian also alludes to this kind of building in his analogy between the Great King and a fish of the sea: both the Great King and the wrasse have wives who live in many chambers (*Anim.* I.14). This is also the picture drawn by ancient authors in many passages deploring the effeminacy of Oriental princes, such as Ninyas, "who was never seen except by the eunuchs and his own wives," or Sardanapalus, who lived with his concubines dressed as a woman and spinning wool in their company (Athenaeus XII.528e–f♦).

The word *gynaikōnitis* is usually rendered 'harem'. On this point, the Near Eastern parallels are contradictory. We should note that in pharaonic Egypt words traditionally

translated 'harem' actually signify something quite different. One of them in particular refers to groups of musician-singers, including both men and women. It seems on the other hand that in the Mari materials the word *sekretum* means 'confined' (fem.), which could designate the women confined in a particular space (*tubqum* 'interior space'). Thus we see that certain elements found in Esther are legitimate. The royal concubines lived in special apartments that, if we take Heraclides literally, were perhaps separated from the royal apartments by the court of *mēlophoroi* (Athenaeus XII.514b).

It is not certain, however, that the royal princesses lived cloistered in their apartments. The Persepolis tablets attest to their frequent travels. The tablets document travel relations, and the record is that the princesses were treated no differently than the men (husbands, fathers) with whom they relocated from time to time. They certainly had greater autonomy than other women, even if it was only due to their activities as managers of their own houses, which included land and a domestic staff. We may once again mention Amytis—Xerxes' sister and Megabyzus's wife—"the most beautiful of all the women in Asia, and the most licentious," according to Dinon (Athenaeus XIII.609a♦). Ctesias stresses her extramarital adventures, which is why her husband complained to Xerxes (§28). "After Megabyzus's death, she devoted herself to seeking out the company of men, just like her mother Amestris," and she had an affair with the physician Apollonides (§42). Setting aside the Greek authors' criticisms, these examples at least prove that the princesses did not live like nuns shut in a cell!

Generally speaking, the aristocratic women were specially educated. Quintus Curtius mentions that "governesses" (*quae educabant*) of the royal children (III.3.23♦), perhaps of girls in particular (III.13.12), were present in Darius III's procession. Moreover, Ctesias gives the example of Roxanne, sister of Artaxerxes II's son-in-law Teritouchmes: "she was very beautiful and highly skilled with the bow and javelin" (§54). This is a unique and very interesting statement implying that girls received a physical education something like boys', during which they studied traditional martial arts. Note also that in Darius III's procession the princesses are accompanied by "horsewomen" (Quintus Curtius III.3.22) and that, according to Quintus Curtius (V.2.19♦), "there is nothing that the women of Persia feel to be a greater disgrace than to work in wool." When we add to this the fact that the woman warrior played a part in Iranian folk traditions, it is tempting to conclude that aristocratic girls were not prepared for a reclusive life at all, even though they had special apartments in the royal palace or their husband's house. Although the term *harem* must be retained for convenience, the usual meaning cannot be applied to any women other than the royal concubines.

In one way at least, these conclusions are illustrated in visual representations. For reasons we have already mentioned, the absence of images of women in court art is not surprising. They are found in other media. Several Persepolis seals are known to have belonged to Princess Irdabama. The images on them do not distinguish them from men's seals. One of them shows a hunting scene (PFS 51), worked out on a model not unlike the seal of Kuraš of Anšan (PFS 93). Another, used by officials linked to Irdabama, has an audience scene with women only, but the scene is obviously copied from the official Achaemenid court ceremony: it recalls the obligation to perform *proskynesis* at court, perhaps an obligation even imposed on persons of higher status, such as princesses and concubines (cf. Athenaeus XIII.556b). On a seal belonging to Artystone we also find the well-known motif of the Royal Hero. The use of seals and the iconographic

themes on them once more attest to the position held by the royal princesses at the Achaemenid court. We should also mention the interesting scenes depicted on a carpet from Pazyryk (obviously of Achaemenid inspiration): two women are praying in front of a footed censer.

5. At the Great King's Table

Dining with the Great King

Of all the festive events at court, the luxury and pomp of the banquets particularly captured the imagination of the ancient authors. Their tales vie with one another to celebrate the abundance of the fare. On their birthday, says Herodotus (I.133♦), rich Persians “will have an ox or a horse or a camel or a donkey baked whole in the oven.” What can we then say about the royal table, which, as Dinon and Ctesias suggest (Athenaeus IV.146c), fed 15,000 people a day?

We are fortunate enough to have a text that is very informative in this area, in Polyaeus's collection of *Stratagems* (IV.3.32):

Since Alexander was in the Persian royal residence, the Great King's lunch and dinner were served to him according to what was inscribed on a bronze pillar, which also bore the other rules (*nomoi*) instituted by Cyrus. Here is what they contained:

1. Wheat flour, pure	400 ardabs
2. Wheat flour, 2d grade	300 ardabs
3. Wheat flour, 3d grade	300 ardabs
Total wheat flour at dinner:	1,000 ardabs
4. Barley flour, very pure	200 ardabs
5. Barley flour, 2d grade	400 ardabs
6. [Barley flour, 3d grade]	400 ardabs
Total barley flour:	1,000 ardabs
7. Barley groats	200 ardabs
8. Very fine flour for beverages	200 ardabs
9. Minced cress	xxx ardabs
10. Ptisane [processed barley?]	10 ardabs
11. Mustard seed	1/3 ardab
12. Sheep and goats (male)	400
13. Cattle	100
14. Horses	30
15. Fattened geese	400
16. Pigeons	300
17. Various small birds	600
18. Lambs	300
19. Goslings	100
20. Gazelles	30
21. Fresh milk of the day	10 <i>marriš</i>
22. Sweetened whey	10 <i>marriš</i>
23. Garlic	1 talent
24. Bitter onions	1/2 talent
25. Herbacious [mercury?]	1 ardab
26. Juice of silphium	1 talent
27. Sweet must of sweetened apples	1/4 ardab
28. Cumin wax	1/4 ardab
29. Black raisins	3 talents

30. Dill flower	3 minas
31. Corn cockle seed	1/3 ardab
32. Arum seed	2 kapetis
33. Sesame	10 ardabs
34. Sweet grape jelly	5 <i>marriš</i>
35. Candied turnips and radishes prepared with salt	5 <i>marriš</i>
36. Candied capers with salt, from which delicious stuffings called <i>abyrtakai</i> are made	5 <i>marriš</i>
37. Salt	10 ardabs
38. Ethiopian cumin	6 kapetis
39. Dried anise	30 minas
40. Parsley seed	4 kapetis
41. Sesame oil	10 <i>marriš</i>
42. Oil extracted from milk	5 <i>marriš</i>
43. Terebinth oil	5 <i>marriš</i>
44. Acanthus oil	5 <i>marriš</i>
45. Oil of sweet almonds	3 <i>marriš</i>
46. Dried sweet almonds	3 <i>marriš</i>
47. Wine	500 <i>marriš</i>

(When the king was in Babylon or Susa, half the wine he drank was palm wine, half grape wine.)

48. Firewood	200 cartloads
49. Kindling	100 cartloads
50. Solidified honey	100 square blocks, 10 minas each

When the king was in Media, this is what he distributed:

51. safflower seed	3 ardabs
52. Saffron	2 minas

All of the above for beverages and lunch.

Besides this, he distributes:

53. Fine wheat flour	500 ardabs
54. Fine barley wheat flour	1,000 ardabs
55. 2d-grade flour	1,000 ardabs
56. Fine fine wheat flour	500 ardabs
57. Barley groats	500 <i>marriš</i>
58. Barley for the animals	2,000 ardabs
59. Chopped straw	10,000 wagons
60. Hay	5,000 wagons
61. Sesame oil	200 <i>marriš</i>
62. Vinegar	100 <i>marriš</i>
63. Finely minced cress	30 ardabs

All of the above is given to the soldiers; it is what the king provides each day for his lunch and dinner and for those who receive his allotments.

To evaluate the credibility of this text, two parts should be distinguished at the outset: the numerical information and the commentary in the introduction and conclusion. Polyacenus draws this moral from the story: as his soldiers stared in envious wonder, Alexander burst into laughter, ordered the bronze pillar knocked down, and remarked to his Friends that such an excessive regular diet would weaken the body and the spirit, as proved by the defeats the Persians had just suffered. This discussion, taken in light of the introduction, communicates all of the clichés about the relationship between the

tryphē (luxury) of the Great Kings and their supposed decadence. It can be compared, nearly word for word, with Herodotus's passage on the reaction of the Greeks to the opulence of Mardonius's tent, which they captured after the battle of Plataea. The words and attitude ascribed to Alexander by Polyaeus correspond very closely to the words and attitude attributed to Pausanias of Sparta by Herodotus:

When Pausanias saw [the tent], with its embroidered hangings and gorgeous decorations in silver and gold, he summoned Mardonius' bakers and cooks and told them to prepare a meal of the same sort as they were accustomed to prepare for their former master. The order was obeyed; and when Pausanias saw gold and silver couches all beautifully draped, and gold and silver tables, and everything prepared for the fest with great magnificence, he could hardly believe his eyes for the good things set before him, and, just for a joke, ordered his own servants to get ready an ordinary Spartan dinner. The difference between the two meals was indeed remarkable, and when both were ready, Pausanias laughed and sent for the Greek commanding officers. When they arrived, he invited them to look at the two tables, saying, "Gentlemen, I asked you here in order to show you the folly of the Persians, who, living in this style, came to Greece to rob us of our poverty." (IX.82♦)

Both of these citations present a motif that is common to many Greek authors (e.g., Athenaeus IV.150b–c; Aelian, *VH* V.1). The stereotype of a king who is decadent because he is too well fed, repeated for example by Strabo (XV.3.22), reappears in many authors of the fourth century (e.g., Clearchus apud Athenaeus XII.539b).

It is highly unlikely that these rules (attributed to the fictive authority of "Cyrus," as in Xenophon) were inscribed on a bronze pillar. It is far more likely that the information comes from an author who was quite familiar with the court customs of the Achaemenid court, perhaps Ctesias, who we know had written a book in which he described everything that was served at the king's dinner (Athenaeus II.67a), or even Heraclides himself. Even so, all of the information *feels* right. First of all, with each reference to Persian measures (*marrīš*, *ardabs*, *kapeties*, etc.), Polyaeus is careful to give an estimate of their size in terms of Greek measures, and the measures he mentions are known from the Persepolis tablets—at least the *ardab* and the *marrīš*. Furthermore, due to the vast quantities of food needed to provision the royal table, the administrators in charge were required to keep a complete list of supplies and quantities. Since we know how meticulous the administrative control at Persepolis was (chap. 11/1), it is not hard to believe that the administrators of the dining room had to produce a certified official document for the heads of the warehouses in charge of acquisition and disbursement, who had to produce a report for the administration every year, which was then duly verified. At the head of this department were probably those whom Xenophon calls "stewards of his commissary department" (Cyr. VIII.1.9♦); Heraclides also mentions an officer whose title in Greek transcription is nearly equivalent (*potibazis*), who was specifically assigned to distributing foodstuffs (Athenaeus IV.145f).

Other details from Polyaeus confirm that he had (indirect) access to a certain amount of original information. He distinguishes the table service according to the location of the court: Persepolis, Susa and Babylon, Ecbatana. This direct reference to the custom of court nomadism constitutes a new measure of the excellence of his sources. We know for sure that wherever the king moved, his table had to be served every day with the same splendor and bounty. We know of only one example to the contrary, the exception that proves the rule. During the army's return from an expedition against the

Cadusians, it suffered food shortages, and on this occasion Plutarch measures the gravity of the destitution by means of a significant formula: "The king's own table failed" (Art. 24.3◊). Herodotus further states that, "when the Persian king goes to war, he is always well provided not only with victuals from home and his own cattle, but also with water from the Choaspes" (I.188;◊ cf. VII.83). But the variations introduced in the process of resupply are fairly modest, relating particularly to products that are hard to transport, such as wine, and doubtless also beer and fish, whose use is well attested in Babylonia (cf. Diodorus XVII.108.4).

It appears that, wherever he was, the king's table was always prepared the same way. This seems to be confirmed by an excerpt, supplied by Athenaeus, from an inventory sent to Alexander by Cleomenes, who was in charge of the financial administration of Egypt. It seems actually to be an inventory of the Great King's wealth in Egypt (cf. IX.393c). The *Letter of Cleomenes* (like that of Parmenion, p. 293 below) is quoted briefly in a long digression on birds and their names. The quotation is limited to a short list: "ten thousand smoked coots, five thousand thrushes, ten thousand smoked quails." We are tempted to think that this was originally an inventory of farms operated to raise domestic fowl (well attested in Polyænus and the Persepolis tablets) near Memphis (or elsewhere) to supply the king's table when he was in Egypt or, on a more permanent basis, the satrap's table. In fact, waterfowl clearly constituted one of the courses commonly consumed at the king's table (cf. especially Herodotus VII.119 and below).

Finally, we can see the overall coherence between Polyænus's information and the information in Heraclides of Cyme. For one thing, both of them clearly specify that the quantity of food could only be explained as soldiers' rations (cf. also Herodotus VII.119). Polyænus adds that they also received wood for cooking (nos. 48–49 in the list above) and that they also fed the beasts of burden, presumably including the horses as well (nos. 58–59). Here is Heraclides' list, certainly incomplete:

One thousand animals are slaughtered daily for the king; these comprise horses, camels, oxen, asses, deer, and most of the smaller animals; many birds also are consumed, including Arabian ostriches—and the creature is large—geese, and cocks. (Athenaeus IV.145e◊)

Heraclides only lists meats here, for the simple reason that the prevalence of meat-eating among the Persians would be especially surprising to the Greeks, who were not accustomed to such a diet (cf. Strabo XV.3.19). The exceptions to the meat menu were sufficiently noteworthy for the ancient authors to mention them explicitly (e.g., Aelian, *VH* I.26.28). Heraclides adds that the soldiers received meat and bread (145f).

Aside from a few differences in detail (there are no ostriches in Polyænus), it is not hard to say that in both documents the basic diet consists of grains and meats (of a very large variety), and other authors also mention these in passing (cf. Strabo XV.3.18; Herodotus I.133; Aelian, *VH* I.33). Another confirmation is found in the famous text of Herodotus describing the gigantic preparations made by the Greek cities for the arrival of Artaxerxes III in 480: "People in every town . . . employed themselves for months on end in making barley and wheat flour, in buying up and fattening the best cattle they could find, and feeding poultry in coops and waterfowl in ponds" (VII.119◊). In another text, in the only passage in which we see what the king actually ate, "Ochus [Artaxerxes III] stretched out his hands; with the right hand he took one of the knives laid out on the table and with the other he picked up the the largest piece of bread, put some meat on

it, cut it up, and ate greedily" (Aelian, *VH* II.17♦). A passage in Plutarch attests to the frequent consumption of small birds (no. 17 in Polyaeus's list; Plutarch, *Art.* 19; cf. Ctesias §61, who transcribes the Persian name of one of them; Athenaeus IX.393c and above).

Category J of the Persepolis tablets (products "delivered to the king") confirms, overall if not in detail, Polyaeus's information. When the king or a member of his family relocated (not necessarily as part of the annual migration of the court), they received products from the administration: cattle (PF 691–94, 710), sheep and goats (696), poultry (697–98, 2033–37), flour (699–704), seed (705–10), oil (727), and other products of uncertain identification. The administration also provided wine (PF 728–32, 735–37; PFa 30, 31). While the number of cattle is not very high (3, 1, 8, 7, 8), the number of sheep and goats is naturally higher (1,124 in PF 696), and so is the quantity of poultry. The amount of flour (in liters) varies from 5,460 (PF 699) to 126,100 (PF 701). The amount of wine furnished varies from 750 liters (PF 728) to 6,900 (PFa 311).

It is true that it is hard to compare these figures with Polyaeus's. Some of the Category J tablets are not clearly distinguishable from Category Q (travel rations), and it is not certain that all of them relate to the annual court migration. At least one of them refers to deliveries to the king at Persepolis—the one with the largest amount of flour (PF 701). Furthermore, they present the same problem as Polyaeus: they do not mention the number of people who had to be fed per delivery. This number can be supplied only by reference to the usual ratio determined from other texts. It has been estimated, for example, that 17,830 liters of flour fed 11,886 people (PF 702).

Polyaeus also lists products not found in the tablets (or not yet identified), especially milk (nos. 10, 22, 42), which could not be stored but was certainly used regularly (cf. in particular Plutarch, *Art.* 22.9: cow's milk). Note that when the king was enthroned, he had to "drink a cup of sour milk (*oxygala*)" (3.2; cf. Polyaeus no. 22). Royalty also ate cheese (Aelian, *VH* I.33) and dairy products (Athenaeus XIII.608a).

Unfortunately, we do not have any of the recipes used by the king's cooks. But the Aelian passage we quoted (*VH* II.17) must not lead us to conclude that the royal table's menu (strictly speaking) was identical to the menu of the soldiers receiving rations. Only the basic ingredients are similar. In fact, Xenophon stresses that the food served to the king was distinguished by high quality: "The food that is sent from the king's board really is much superior" (*Cyr.* VIII.2.4♦), and by way of explanation he emphasizes the specialization of the cooks (VIII.2.6), among whom Athenaeus singles out "the cooks who specialized in preparing dairy dishes" (XIII.608a [Loeb: "pudding-makers"]). Many Greek authors—with a polemical viewpoint identical to Xenophon's (*Ages.* 9.3)—stress that the Great King's cooks were always hunting for new recipes, even bringing them from afar (Athenaeus IV.144b–c; XII.529d; 539b; 545d, f). As Polyaeus's remark regarding capers (no. 36) implies, the birds normally were stuffed. The Persians also served meat in salted form (Athenaeus IX.393c; cf. Plutarch, *Art.* 18.4). Diodorus (XVII.67.4) alludes to "various culinary preparations" that were transported from Persia to Babylonia, undoubtedly to serve the royal table, or again to the manifestation of senseless luxury (*tryphē, hybris*) that led Harpalus to have fish brought from the Persian Gulf (Diodorus XVII.108.4). Obviously, Persian cuisine, like the cuisine of present-day Iran, possessed a delicate subtlety (cf. Athenaeus XII.545e).

Let us emphasize the variety of oils as well (no. 41–46). Ctesias says that an acanthus oil was made in Carmania for the king, and Amyntas noted that in Persia "the moun-

tains produce turpentine [pistachio], squills, and Persian nuts, from which much oil is made for the king" (Athenaeus II.67a◊). On the other hand, Ctesias mentions neither pepper nor vinegar, even though the latter is listed by Polyaeus (no. 62). The last striking thing about Polyaeus's text is the considerable profusion and diversity of condiments and aromatic herbs (nos. 25–26, 28, 30–33, 38–41, 51–52, 63). This is not surprising when we realize their importance to the Persians for medicinal use (p. 266), which does not differ fundamentally from their culinary use. One of these herbs is noteworthy: the terebinth, from which oil is obtained (no. 43; nearly 50 liters). This refers to pistachio nuts, which were very popular among the Persians. Strabo mentions it specifically among the plants that the young people had to learn to recognize (XV.3.18). We also know that it was included in the diet of a crown prince who was preparing to be proclaimed king (Plutarch, *Art.* 3.2). Nicolaus of Damascus records the Medes' pejorative judgment on the Persians, characterizing them as "terebinth-eaters" (*FGrH* 90 F66.34).

The variety of dishes is stressed by Herodotus, who contrasts it with Greek practices:

The main dishes at their meals are few, but they have many sorts of dessert (*epiphorēmata*), the various courses being served separately. It is their custom that has made them say that the Greeks leave the table hungry, because we never have anything worth mentioning after the first course: they think that if we did, we should go on eating. (I.133◊)

Actually, the ancient authors give several examples of Greeks who were invited by Persians (the Persians call them "barbarian" buffoons!) and stuffed themselves to such an extent that one of them alone ate what had been prepared for the satrap Ariobarzanes and his nine guests (Athenaeus X.413a–c; cf. X.415f). Even Ctesias (if it's the same Ctesias) was famous for gluttony (Aelian, *VH* I.27). Consider also Pharaoh Tachos, who took pains to imitate the Great King—and died of indigestion (Aelian, *VH* V.1)! But, contrary to Greek popular opinion (cf. Aelian, *Anim.* II.11), Heraclides states that the portions taken by the Great King's guests were relatively modest (Athenaeus IV.145e; cf. Strabo XV.3.22). This obviously does not mean that there were no Persians who could be mocked for their dietary habits: one of a dozen men famous for gluttony listed by Aelian (I.27) was a Persian, Cantibaris, who never closed his mouth and whose servants were instructed to shovel the food "into him as into a lifeless vessel" (Athenaeus XV.416b◊)!

Aside from these charming anecdotes, Herodotus's text includes an interesting element on the organization of the meal: the side-dishes were served (as they should be) throughout the meal, punctuating the presentations of the main courses. These side-dishes certainly were included in the hundred dishes served daily by the Paphlagonian prince Thuys, who boasted of setting a table as luxurious as the Great King's (Athenaeus IV.144f). The Persians' sweet tooth is also stressed by Xenophon (who obviously takes it as another argument proving their decadence): "Whatever sorts of bread and pastry for the table had been discovered before, none of those have fallen into disuse, but they keep on always inventing something new besides; and it is the same way with meats; for in both branches of cookery they actually have artists to invent new dishes" (*Cyr.* VIII.8.16◊). Polyarchus praised the "many kinds of cakes" invented by the Persians (Athenaeus XII.545e◊). The honey listed by Polyaeus (no. 50) was probably used for the preparation of these cakes.

The Persians also enjoyed many fruits: dates (Aelian, *VH* I.33), pomegranates (I.33), and figs (Dionon apud Athenaeus XIV.652b–c; Plutarch, *Mor.* 173c), as well as apples (no. 27), raisins (no. 29), and almonds (no. 46). Additionally, a Persepolis tablet reports

Fig. 40. Servants waiting on tables: Persepolis (small staircase south of the Tripylon).

the variety of fruit trees planted in the royal paradises (PFa 33: quince trees, pear trees, etc.; cf. also PFa 1). The Greeks surely knew this, since they transplanted many shrubs from the Near East during the Persian period, such as arbutuses, mulberry bushes, pomegranate trees, and doubtless many others. This is evident in a letter sent to Gadatas rewarding him for planting trees native to Ebir Nāri in Asia Minor (ML 12).

"The Persians "are very fond of wine," Herodotus remarks (I.133◊), and in this he is followed by all of the ancient authors. Cambyses was particularly notorious in this department (Herodotus III.34), and Cyrus the Younger boasted of holding his wine better than his brother Artaxerxes (Plutarch, *Art.*, 6.1). The quantities given by Polyaeus are not particularly high, however (no. 47: about 50,000 liters), if we keep in mind distribution to the soldiers. It is true that the king himself drank a special wine reserved for him (Poseidonius and Heraclides apud Athenaeus IV.145c and I.28d; Strabo XV.3.22). Herodotus mentions this in connection with the *symposia* [drinking feasts], as do Aelian (VH XII.1) and Strabo: "They carry on their most important deliberations when drinking wine" (XV.3.20◊). According to Heraclides, it was the same during the *symposia* organized around the king after dinner with his select drinking companions (*sympotoi*; Athenaeus IV.145c). They would go home drunk, he writes, on the model of the drinking companions of Holophernes (Judith 12:20; 13:1). We may presume that the palm wine served during the court's stay at Susa and Babylon would have had the same effect!

Service at the King's Table

The ancient authors also stress the proliferation of domestic staff who specialized in waiting on tables, who are also represented on stairways at Susa and Persepolis (fig. 40).

Xenophon tries not to omit any of the palace servants: "bakers, cooks, cup-bearers, . . . butlers, waiters" (Cyr. VIII.8.20◊). The writers concentrate a great deal of their attention on personnel when they describe the Persian kings' and generals' tents. Actually, when the king and court were on the road, the entire kitchen staff went with them: pantry chiefs, cupbearers (Xenophon, *Anab.* IV.4.21), head bakers and provisioners (Plutarch, *Alex.* 23.5), bakers and cooks (Herodotus IX.82), "female cooks" (VII.186–87◊), in short "troops of sutlers and batmen" (Quintus Curtius III.3.25◊).

From this point of view the most interesting (because it is the most precise) text, once more, is a passage from Athenaeus. We know that, before the battle of Issus, Darius took care to leave all of his baggage at Damascus—that is, the women and children and all of the impedimenta that would slow down the army on its march and that one would want to protect from possible pillaging (cf. esp. Quintus Curtius III.13): everything the Greeks called the *aposkeuē* (Athenaeus XIII.607f). After the battle, Parmenion was instructed to take Damascus, which he soon did. He then ordered specialist officials to take inventory, as was normal in such circumstances (Xenophon, *Cyr.* VII.4.12–13; 57; Athenaeus IX.393c; XI.784a–b; cf. Plutarch, *Crassus* 17.9). Thanks to Athenaeus's recounting of the story, we have the unusual opportunity of consulting a quotation from this original accounting document. The quotation is partial: due to the structure of his work, Athenaeus provides only the data relating to kitchen and banquet personnel, as well as a sample of the dishes seized at Damascus (XI.781f–782). Here is the enumeration found in the *Letter of Parmenion* (XIII.608a):

Royal concubine musicians (<i>mousourgoi</i>)	329
Chaplet-weavers (<i>stephanoklopoi</i>)	46
Cooks (<i>opsopoi</i>)	277
Young kitchen helpers (<i>khytrepsoi</i>)	29
Cooks who specialize in dairy dishes (<i>galaktourgoi</i>)	13
Beverage-preparers (<i>potematopoi</i>)	17
Wine filterers (<i>oinoēthētoi</i>)	70
Perfume makers (<i>myropoi</i>)	14
Total	795

We see that job specialization was well established, even within the category of cooks, young kitchen assistants, and other preparers. The waiters should be added to all of these domestics, of whom Heraclides states: “All who attend upon the Persian kings when they dine first bathe themselves and then serve in white clothes, and spend nearly half the day on preparations for the dinner” (IV.145b◊).

Musicians, Dancers, and Artists

It is not surprising that royal dinners were not confined to taking nourishment. They made an important social and political statement and had much symbolic value. The king's table, truly a symbol of the king's power (see chap. 5/6 above), was the preeminent place for gift-giving and royal largesse. In other words, in Persia as elsewhere, the banquet was a festival in every sense of the word, which at the Great King's court was organized according to the most meticulous rules of protocol. It was a festival organized around the royal person.

This explains the presence of women musicians and other artists who were placed in charge of the festival in Parmenion's inventory. They were an integral part of a banquet (cf. Athenaeus II.48f), just as much as the perfumes and the crowns (Nepos, *Ages.* 8.2). Did not Artaxerxes II honor the Spartan Antalcidas in a very special way by sending him “his own chaplet after dipping it in perfume” (Athenaeus II.48e◊)? In his well-known description of royal meals, Heraclides states that “throughout the dinner his concubines sing and play the lyre; one of them is the soloist, the others sing in chorus” (Athenaeus IV.145c◊). Similarly, Annaros, whom Ctesias portrays as the governor of Babylonia (in a romance that is highly suspect on historical grounds), imitated Artaxerxes by employing

150 women who played the harp and sang throughout the dinner (XII.530d). Likewise, Straton of Sidon occupied his time “drinking and listening to harp-singers and rhapsodists.” For this purpose “he used to summon . . . many singing-girls from Ionia, besides girls from every part of Greece, some of whom were singers, some dancers” (XII.531a–b). The musicians (*mousourgoi*) captured by Parmenion were flutists and harpists (XIII.607f). The practice was well enough known to justify entering the word *mosargoi* in the dictionary of the *Suda*, which defines them as musicians specializing in the flute, which they play while others sing; they stop singing when the king drinks, returning to their songs and harmonies when the guests’ drinks are poured.

Many other artists entertained the fellow diners, as shown by the accounts of the wedding feast given at Susa by Alexander. According to Polycleitus, male and female flutists always accompanied Alexander, drinking in his company (Athenaeus XII.539a). During the five-day banquet at Susa, Alexander and his guests applauded the famed Indian jugglers, as well as many Greek artists: lyric singers, harpists, flutists, singers, and dancers (XII.538e–f). At Artaxerxes II’s court, Ctesias says, Zeno the Cretan was the king’s favorite dancer (I.22d). We can understand Polyarchus’s envious admiration, emphasizing the variety of spectacles and concerts that punctuated the Great Kings’ court life (Athenaeus XII.545f)!

In fact, the most famous artists of the known world were summoned (cf. Herodotus III.137), and they appeared before the king and courtiers, but not necessarily during the banquets. We are put in mind of the athlete Polydamas in Greece:

But this man . . . is the tallest of our own era. . . . Darius [II] . . . learning when he was king of the exploits of Polydamus, sent messengers with the promise of gifts and persuaded him to come before his presence at Susa. There he challenged three of the Persians called Immortals to fight him—one against three—and killed them. (Pausanias VI.5.7♦)

When he returned to Greece the athlete’s great deed was engraved on a stone and depicted on a stela, both of which were placed at Olympia; the stela showed the hero in full action before the king seated on his throne.

Cups and Couches

The royal Persian banquet was surrounded with untold luxury. The Greek authors were particularly struck by the richness of the dishes and cups. In another extract from the *Letter of Parmenion*, Athenaeus quotes the inventory of cups: “Gold cups, weight seventy-three Babylonian talents, fifty-two minae; cups inlaid with precious stones, weight fifty-six Babylonian talents, thirty-four minae (XI.781f–782a♦ [Loeb p. 39]). Elsewhere, as we have seen, he mentions an inventory, sent by Cleomenes to Alexander, perhaps a description for Alexander of the very luxurious royal Persian furnishings found at Memphis that were now in Alexander’s possession (cf. Quintus Curtius IV.7.4). As always, Athenaeus’s quotation of Cleomenes is abbreviated; Athenaeus selected only the details useful to him at the moment, which in this case was a very long discussion of the various names of drinking vessels. The quotation goes:

3 silver *batiakai*, gilded, silver *kondya* 176; of these thirty-three are gilded. One silver *tisigitēs*. Silver spoons, gilded, thirty-two. One silver flask-castor. One ornamented silver wine-container of native manufacture (*barbarikon*). Other small cups of every variety, twenty-nine; drinking-horns, gilded *batiakai* made in Lycia, censers (*thymiatēria*), and bowls. (XI.784a–b♦ [Loeb p. 53])

Fig. 41. Selection of Achaemenid vessels.

Athenaeus included explanations of the vessels' names that were unfamiliar to the ears of his Greek readers. The *batiakē* is a Persian vial, he writes (XI.784a). He goes on to describe the vessel called *labrōnia*, so named (in his opinion!) "from the violence (*labrotēs*) which arises in drinking. In design it is flat and large; it also has large handles" (XI.484c↔ [Loeb p. 151]). One author speaks of a *labrōnios* weighing 200 *chrysoi*,

another vessel of this type was said to weigh 120 *chrysoi* (XI.484d–e). The reference to censers (*thymiatēria*) is interesting. They are often shown on Achaemenid reliefs and seals, especially the Persepolis audience reliefs. Elsewhere, Athenaeus mentions them among banquet paraphernalia, along with perfumes, many kinds of garments and carpets, cups, and other utensils (XII.545e). Among the Persian-type cups, the *sannakra* (XI.497e), the *kondy* (XI.478a), and even the *prokhois*, are also listed by Athenaeus (XI.496c), who cites Xenophon (*Cyr.* VIII.8.10♦), who wrote in his chapter on “Persian decadence”:

They also had the custom of not bringing [chamber] pots (*prokhoïdes*) into their banquets, evidently because they thought that if one did not drink to excess, both mind and body would be less uncertain. So even now the custom of not bringing in the pots still obtains, but they drink so much that, instead of carrying anything in, they are themselves carried out when they are no longer able to stand straight enough to walk out.

The originator of Athenian New Comedy, Menander, is again quoted by Athenaeus (XI.484c–d♦); in two of his plays, Menander takes inventory of the riches the Macedonians found in the wealthy Persian treasury in Cindya in Cilicia:

We’re living high, and I don’t mean moderately; we have gold from Cyinda; purple robes from Persia lie in piles; we have in our house, gentlemen, embossed (*toreumata*) vessels, drinking-cups, and other silver ware, and masks in high relief, goat-stag (*tragelaphoi*) drinking horns, and *labronioi* . . . beakers set with gems and *labrōnia* (were brought in), and Persians stood there holding fly-flaps.

These texts describe the Persian dinnerware abundantly found here and there, including in the Persepolis and Susa deposits. They refer explicitly to the engravings and animal decorations regularly exhibited on the cups that wealthy Persians drank from, except for (1) those who had been demoted, whom the king forced to use a ceramic cup (Athenaeus XI.464a), and (2) the king, who drank from a special egg-shaped cup (*ōion*), according to Dinon (XI.503f). The Greeks were even more familiar with Persian dinnerware because they managed to capture it several times. In a passage that would do an Oscar-winning Hollywood screenwriter proud, Quintus Curtius describes the pillaging of Darius III’s Treasury at Issus:

The Persians call men who carry burdens on their shoulders *gangabae*; these, since they could not endure the severity of the weather—for a storm had suddenly brought a fall of snow and the ground was stiff being then bound in frost—put on the robes adorned with gold and purple, which they were carrying with the money, and no one dared to forbid them, since the ill-fortune of Darius gave licence over him even to the lowest of men. . . . Scattered over all the fields lay the king’s riches, the money designed for the pay of a great force of soldiers, the adornments of so many men of high rank, of so many illustrious women, golden vases, golden bridles, tents adorned with regal splendour, chariots too, abandoned by their owners and filled with vast riches. . . . hands of the ravishers were not sufficient to carry the spoil. (III.13.7–11♦)

This passage by Quintus Curtius can easily be compared with Diodorus’s (XVII.75) and another of his own (Quintus Curtius V.6.3–8) descriptions of the looting of Persepolis by Alexander’s soldiers. In the wreckage of the Persian navy in 480, a Greek “picked up a large number of gold and silver drinking-cups which were washed ashore, and included among his finds Persian treasure-chests and innumerable other pieces of valuable property” (Herodotus VII.190♦). The booty was so attractive that “the most

accomplished diver of his day . . . after the wreck of the Persian ships at Pelium had saved a great deal of valuable property for his masters—besides getting a good deal for himself" (VIII.8♦)! It was the same in Mardonius's tent, which was filled "with its embroidered hangings and gorgeous decorations in silver and gold" (IX.82♦): in the Persian camp they found "tents full of gold and silver furniture; couches overlaid with the same precious metals; bowls, goblets, and cups, all of gold; and waggons loaded with sacks full of gold and silver basins" (IX.80♦). Likewise, Tiribazus's tent was looted, "with silver-footed couches in it, and drinking cups, and people who said they were his bakers and his cup-bearers" (Xenophon, *Anab.* IV.4.21♦). At Persepolis, according to Quintus Curtius (V.6.5♦), the soldiers "broke with mattocks vases of priceless art."

The Persians took their meals reclining on wonderfully ornate couches, such as the one given by Artaxerxes II to the Cretan Entimus, with all the accessories needed to indicate that he was a favorite: "A silver-footed bed with its coverings, a tent with gaily-coloured canopy, a silver throne, a gilded sun-shade, twenty gold saucers set with jewels, one hundred large saucers of silver, and silver mixing-bowls, one hundred concubines and one hundred slaves . . ." (Athenaeus II.48♦). There were rugs and cushions on these couches, arranged by a specialist, which is why the king added to the valuable linens "a slave to spread them, alleging that the Greeks did not know how to make a bed" (II.48d♦). In fact, said Heraclides, "the Persians were the first . . . to institute the so-called 'bed-makers' (*strōtai*), in order to secure beauty and softness in the coverings" (II.♦48d). In this matter, too, protocol reserved a distinction for the king: during *symposia*, "his fellow-drinkers (*sympotoi*) sit on the floor, while he reclines on a couch supported by feet of gold" (Athenaeus IV.145c♦), ground that no doubt was provided with comfortable rugs (cf. Xenophon, *Cyr.* VIII.8.16; *Hell.* IV.1.30)! At the wedding in Susa, the guests' couches were silver, but Alexander's couch had gold legs (Athenaeus XII.538c).

6. The Royal Hunts

As in every court in the ancient Near East (and elsewhere), kings loved long hunting parties. Clearly they represented one of the privileged loci for aristocratic and court sociability, as symbolized by the thorough training that young Persians received (Strabo XV.3.18). Depictions of the hunt are innumerable on Achaemenid stamps and stelas.

In one of the many hunting scenes that Xenophon liked so much, he shows the young Cyrus "exhaust[ing] the supply of animals in the park (*paradeisos*) by hunting and shooting and killing them, so that Astyages was no longer able to collect animals for him" (I.4.5♦). Hunts actually took place either in open spaces or in enclosed paradises, as at Dascylium (*Hell.* IV.1.15). At Celaenae in Greater Phrygia, "Cyrus had a palace and a large park full of wild animals, which he used to hunt on horseback whenever he wished to give himself and his horses exercise" (*Anab.* I.2.7♦). The paradises were centers for horticultural experimentation and living symbols of the fertility of the king (chap. 6/5); they also constituted hunting reserves, such as the one in Sogdiana described by Quintus Curtius:

There are no greater indications of the wealth of the barbarians in those regions than their herds of noble wild beasts, confined in great woods and parks. For this purpose they choose extensive forests made attractive by perennial springs; they surround the woods with walls (*muris nemora cinguntur*), and have towers as stands for the hunters. (VIII.1.11–12♦)

This was also true of the paradise near Ecbatana; guards were stationed at the entrance (VII.2.28). These paradises were quite large. We know this because Cyrus the Younger held a review of his troops in the paradise of Celaenae involving 13,000 men in all (Xenophon, *Anab.* I.2.9) and because Alexander could dine in the Sogdiana paradise with his entire army (Quintus Curtius VIII.1.19). There must have been a considerable number of captive beasts, since, according to Quintus Curtius (VIII.1.19), Alexander and his party killed no less than 4,000. The Macedonians probably borrowed this practice from the Persians:

The members of the royal house of Macedon had always been devoted to hunting, and the Macedonians had reserved the most suitable areas for breeding game. These districts during the war had been as carefully preserved as formerly, but had never been hunted for four years owing to the exigencies of the times, so there was an abundance of big game of every kind. . . . Aemilius . . . placed the royal huntsmen (*hoi kynegoi basilikoi*) at Scipio's disposal, and gave him complete control over the preserves. (Polybius XXXI.29.1–5♦)

Aristocratic ethics did not exclude the use of traps (cf. Polyaeus VII.14.1). We also know that during their horsemanship training young Persians learned to make human hunting “nets” (Strabo XV.3.18). There is a vivid example of this kind of hunt in Herodotus. Here is how he claims the Persians lowered the resistance of the Greeks at the end of the Ionian revolt:

Each island, as soon as it was occupied, was gone through with the drag-net—a process in which men join hands and make a chain right across the island from north to south, and then move from one end to the other, hunting everybody out. (VI.31♦)

It seems obvious that the Persians employed a technique in war that was borrowed from the hunt, with its hunters and beaters. Furthermore, the Assyrian reliefs often show hunting with this type of net.

Every royal hunt thus required meticulous preparation, probably carried out under the direction of specialized officials, those whom the author of the *De Mundo* (398a♦) calls “leaders in war and hunting.” They had to choose the animals—fed and prepared in select groups (Plutarch, *Alex.* 73.6)—then free them from the cages where they were kept, as we see being done on Assyrian reliefs. They also had to gather the hunting dogs (fig. 42). There were thus many participants at various levels with various jobs, as seen in an episode in the *Cyropedia*: “[Astyages] took [Cyrus] out to hunt; he had got the boys together, and a large number of men both on foot and on horseback, and when he had driven the wild animals out into country where riding was practicable, he instituted a great hunt” (*Cyr.* I.4.14♦). The author emphasizes the security requirements: “[Astyages] let [Cyrus] go out with his uncle and he sent along some older men on horseback to look after him, to keep him away from dangerous places and guard him against wild beasts in case any should appear” (I.4.7♦). It is true that at the time Cyrus was very young and the hunt was taking place in an open space.

Finally, there is the matter of the hunt's royal escort. Even in this situation, there was selectivity among the court nobles: it was a signal honor to be chosen as a hunting companion; Themistocles says: “The king invited him to partake of his own pastimes and recreations both at home and abroad, carrying him with him a-hunting” (Plutarch, *Them.* 29.6♦). The king was surrounded by his most faithful companions (or so he thought: Aelian VI.14). He was surely also accompanied by his bodyguards, since on the hunt the king was more vulnerable than elsewhere. Two court histories report attempts on a king's

Fig. 42. Dogs used in the hunt and in battle by the Assyrians.

life during a hunt (Herodotus III.30; Aelian VI.14). To render the solemnity of the moment still more striking, the king was undoubtedly accompanied by a large escort. Heracles even claims that he did not go out without his concubines (Athenaeus XII.514c)!

7. Royal Pomp

As we keep stressing, the preceding pages are based essentially on the Greek sources, which in some cases can be compared with Persian or “Greco-Persian” iconographic evidence. Two currents can be distinguished in the Greeks’ interpretation of the luxury of the royal court. One is represented by Xenophon. In the *Cyropaedia*, he analyzes each element of protocol in terms of obsessive concern for the Great King’s security, whether it was the institution of the eunuchs, the protocol of the royal table, the audience, or whatever. No doubt this sort of preoccupation was always present. But by constantly referring to security, Xenophon in a way offers his readers a very limited vision, only occasionally mentioning the royal desire to communicate the image of a man above men (e.g., VIII.1.40–42; 3.4, 14).

For most of the Greek authors, the untold splendor of the palace and the rigidity of court protocol constituted first and foremost a striking manifestation of Persian *tryphē* (‘luxury’), setting a precedent and example for everyone else: “The first men in history to become notorious for luxurious living were the Persians.” Athenaeus sees proof in the nomadism of the Achaemenid court (XII.513e–f↔). In order to animate his account with real-life examples, he has a long discussion in which he quotes a large number of authors who looked into the question (514a–515a↔). These pages represent a sort of dense summary of Greek information on the Persian court, which it is advisable to review here.

Dionon mentions the *labyzos*, a highly aromatic substance more costly than myrrh with which the Great King’s hair was done, as one of the visible marks of this *tryphē*. He

also mentions the footstool the king regularly used when he descended from his chariot (p. 221). Heraclides states that the king was never supposed to be seen walking on foot in his palace; he only did so to cross the court of the *mēlophoroi*, and even then he walked on carpets that were reserved for him: "When he reached the last court he would mount his chariot, or sometimes his horse." Heraclides also mentions particularly luxurious objects: the footstool, the royal throne made of gold whose four small columns were encrusted with jewels and over which was thrown a rich cloth embroidered with purple. Agathocles mentions the vase containing "water called 'golden'" reserved for the king and his eldest son (see p. 521). Chares of Mytilene describes the famous Golden Vine (p. 235), as does Amyntas, who also mentions a superb gold crater, the work of Theodoros of Samos. Clearchus refers to the eunuchs (whom the Medes/Persians gathered from neighboring peoples), and Heraclides the concubines who accompanied the king on his hunts and charmed his nights. Finally, as absolute proof of unlimited, enervating *tryphē*, Chares speaks of locked Treasuries in rooms that opened onto the royal chamber ("royal pillow" and "royal footstool"; see p. 469). Elsewhere, Athenaeus quotes Aristoxenus's *Life of Archytas*, which refers to Polyarchus, who was famous for his appetite for joy of the flesh. To work out his discourse on the theme of pleasure and *tryphē*, Polyarchus cites the example of the Great King, describing "the comforts enjoyed by the king of Persia . . . , his indulgence in sexual pleasures, the perfumed odour of his body, his elegance and manners of conversation, the spectacles and the entertainments by artists," and he states that, from his point of view, "the king of Persia was the happiest man of the times" (XII.545f◊).

We clearly see that the ancient authors filtered their information through the sieve of their own obsessions—hence the abundance and number of descriptions of the royal table and references to the *pallakai*. Not one of them makes the slightest allusion to the Persepolis reliefs, not even Diodorus, the only one who gives a description of the terrace and palaces (XVII.71.3–8). This choice allowed them to capture the interest of their potential readers, all the while working out their preferred discourse, in which peremptory judgments on the ineluctable dissipating effect of wealth mingled with spellbound admiration for the luxury and might of the Great King. Nevertheless, and in spite of their prejudice and their observational nearsightedness, their accounts also testify to the reality of royal splendor that was enacted daily according to the script of the court regulations. For, in the eyes of the Great Kings themselves, the luxury of the palace, the profusion of Treasuries, the splendor of the festivals, and the richness of the tapestries and clothing were a mark of their ostentatious power. This is just how Heraclides of Pontus understands it in his work *On Pleasure (Peri Hēdonēs)*, where he provocatively takes on the dominant theory:

Tyrants and kings, being in control the good things of life, and having had experience of them all, put pleasure in the first place, since pleasure makes men's natures more lordly. All persons, at any rate, who pay court to pleasure and choose a life of luxury are lordly and magnificent, like the Persians and the Medes. For more than any other men in the world they court pleasure and luxury, yet they are the bravest and most lordly of the barbarians. Indeed to have pleasure and luxury is a mark of the freeborn; it eases their minds and exalts them; but to live laborious lives is the mark of slaves and of men of low birth. (Athenaeus XII.512a–b◊)

The same interpretation is found in Plutarch, in a discussion derived directly from the propaganda of Artaxerxes II's court:

The king . . . upon this journey made it appear plainly that cowardice and effeminacy are the effects, not of delicate and sumptuous living, as many suppose, but of a base and vicious nature, actuated by false and bad opinions. For notwithstanding his golden ornaments, his robe of state, and the rest of that costly attire, worth no less than twelve thousand talents, with which the royal person was constantly clad, his labours and toils were not a whit inferior to those of the meanest persons in his army. (Art. 24.9–10♦)

In other words, *tryphē* is not reducible to decadent luxury; it is, rather, a striking sign of royal power.

By insisting on the rules of court protocol, the ancient authors do not fundamentally misrepresent reality. All of their details reveal a symbolic Achaemenid vision: whatever he did (walk, sleep, eat, hunt, make love, etc.), the Great King distinguished himself and wanted to distinguish himself from the common mortal. The Greek misunderstanding regarding the divinity of the Great King is understandable. He was a being apart, to whom unlimited respect and submission were due. Court protocol existed to burn this permanently into memory, especially the rules for royal audiences and a table etiquette that reserved a ceremonial couch, special cup, water and wine reserved for his own use, and waiters previously purified by a bath and wearing a white robe. All in all, the Classical authors in their own way have provided a magnificent, lively commentary on court life and royal splendor, or at least they have made it possible for us to do so. For this reason, we would like to suggest to the Great King that—just as he did for Antalcidas—he send Athenaeus and Aelian “his own chaplet after dipping it in perfume”!

Chapter 8

The King's Men

We have seen through text and image that the exaltation of the king's person is a constant theme in the mainstream of the Classical sources. Aristotle, although he does not mention it explicitly, clearly includes the Achaemenid monarchy in the category he calls *pambasileia* 'absolute monarchy', which was found, he writes, "among certain barbarian peoples." Like so many of his contemporaries, he believed that, because the barbarians' character inclines them more to servility than the Hellenes, and the Asiatics more than the Europeans, they endure despotic rule with nary a complaint (Aristotle, *Pol.* VII.6). Within the structure of this *pambasileia*, the king wielded universal authority in obedience to nothing but "his own will" (Aristotle, *Pol.* VII.7). This interpretation streams from the pen or the lips of many Greeks. Among many examples, we may simply note the remark that Xenophon attributes to Jason of Pherae in the context of a stereotypical speech intended to prove that the conquest of the Achaemenid Empire was simple: "I know that everybody there, save one person, has trained himself to servitude (*douleia*) rather than to prowess (*alkē*)" (Xenophon, *Hell.* VI.1.12♦).

In a way, the picture obtained from the Greeks is not much different from the picture that Darius and his successors sought to establish in text and image. But both pictures tend to reduce the problem to the person of the king alone, whether denouncing the despotic regime or exalting the virtues of the man who was able to govern so many peoples and countries thanks to his uncommon virtue. It is obvious that the historian cannot be satisfied with these ideologized approaches. It is important to pose more concretely the problem of the relationships between the king and those who served him and held the highest positions in the Empire.

1. The Giving King

The Royal Statements

On several occasions, Darius and Xerxes give voice to another quality of the good king: he shows favor to those who have aided him or who can be expected to aid him in the course of time. With reference to 'justice' (*arstam*), which guides all his actions, Darius at Behistun exclaims, "The man who cooperated with my house (*viθ*), him I rewarded well; whoso did injury, him I punished well" (*DB* §63♦). He also adjures his successors not to be a friend "of the man who shall be a Lie-follower or who shall be a doer of wrong— . . . punish them well" (§64♦). Likewise, at Naqš-i Rostam: "What a man does or performs according to his powers, (therewith) I am satisfied, and my pleasure is abundant, and I am well satisfied" (*DNb* §8e♦), as well as in Xerxes' parallel inscription: "And I generously repay men of good will" (*XPl* 26–31). The benefits awarded to the men of good will frequently are the protection of Ahura-Mazda and "family in abundance" (*DB* §§60♦–61, §§66♦–67). This recalls the words that Herodotus ascribes to Cambyses on his deathbed, when he adjured those close to him to defeat Smerdis the

usurper: "If you do as I bid you, I pray that the earth may be fruitful for you, your wives bear you children, your flocks multiply" (Herodotus III.65♠).

The King's Benefactors

A well-known story of benefaction in the Persian court appears in the biblical book of Esther:

That night, the king could not sleep; he called for the Record Book, the Chronicles, to be brought and read to him. They contained an account of how Mordecai had denounced . . . two of the king's eunuchs serving as Guardians of the Threshold, who had plotted to assassinate king Ahasuerus. "And what honour and dignity," the king asked, "was conferred on Mordecai for this?" "Nothing has been done for him" . . . [Haman said to the king:] "If the king wishes to honour someone, have royal robes brought, which the king has worn, and a horse which the king has ridden, with a royal diadem on his head. The robes and horse should be handed to one of the noblest of the king's officers, and he should array the man whom the king wishes to honour and lead him on horseback through the city square, proclaiming before him: "This is the way to treat a man whom the king wishes to honour." (Esther 6:1-9♠)

Another story is told by Herodotus. He records that, during the battle of Salamis, Xerxes followed the progress of the fighting from the shore: "Xerxes watched the course of the battle from the base of Mt. Aegaleos, across the strait from Salamis; whenever he saw one of his officers behaving with distinction, he would find out his name, and his secretaries (*hoi grammateis*) wrote it down (*anagraphon*), together with his city and parentage" (Herodotus VIII.90♠; cf. Plutarch, *Them.* 13.1). These are the conditions under which, for instance, Theomestor "was invested by the Persians with the lordship of Samos, and Phylacus was enrolled in the catalogue of the King's Benefactors (*euergētēs basileōs anagraphē*) and presented with a large estate," and Herodotus adds this detail: "The Persian word for King's Benefactors is *orosangae*" (Herodotus VIII.85♠). Whatever the linguistic and etymological reality may be, the reference to a Persian word implies the existence of a recognized court category.

It is clear, then, that there was a register at court in which the names of those who had received the title of Benefactor were written. In a letter he sent to Gadatas, Darius congratulates him on his horticultural achievements, and he states: "For that, you will receive great recognition (*megalē charis*) in the king's house" (ML 12). Likewise in a letter (perhaps) sent by Xerxes to Pausanias of Sparta: "An obligation (*euergesia*) is laid up for you in our house, recorded forever (*es aiei anagraptos*)" (Thucydides I.129.3♠). These are the conditions under which Syloson the Samian went to find Darius shortly after his accession: "He hurried to Susa, sat down at the entrance of the royal palace, and claimed to be included in the list of the King's Benefactors" (Herodotus III.140♠). Darius made the following statement to Coes (commander of a contingent from Mytilene), who had just given him good advice: "When I am safely home again, my Lesbian friend, . . . be sure to come and see me, so that I may make some practical return for your excellent counsel" (Herodotus IV.97♠). On his return from Sardis, Darius did indeed keep his promise (V.11). This is exactly the meaning of the story of the relationship between Ahasuerus and Mordecai as told by the redactor of Esther: when he learned from the Book of Benefactors of the services rendered by Mordecai, the king was astonished that the Jew of Susa had received no honor, and he soon took steps to repair the oversight (Esther 6).

These examples demonstrate the importance of performing a "good deed" under the very eyes of the king—"each striving to appear as deserving as he could in the eyes of Cyrus," remarks Xenophon (*Cyr.* VIII.1.39♦). On this account, the expedition of 480 represents a particularly significant example. For the Greek authors, the combats were veritable spectacles that unfolded before the king's eyes. From the beginning, the scenery and actors were set. At Abydos, they laid out a marble loggia from which Xerxes watched his army march past (Herodotus VII.44); then, at Doriscus, the king reviewed his troops (chap. 5/5 above). From then on, Xerxes was a perpetual spectator: "From the European shore Xerxes watched his troops coming over under the whips" (VII.56♦). At Thermopylae, he was seated on his throne, reacting with passion to the unpredictable turns of events in the combat (VIII.212). Diodorus also did not miss any opportunity to contrast the motives of the Greek soldiers with the Great King's: the former were prodigies of valor because they were infused with the desire to preserve their liberty; the barbarians, however, tried to distinguish themselves because "[they] had the king as a witness of their valour" (Diodorus XI.7.1♦). At Salamis, Xerxes chose "a spot . . . from which he could watch the course of the battle" (XI.18.3♦). He was accompanied by his secretaries, who recorded the names of valiant warriors (Herodotus VIII.86). The soldiers knew that the king's eyes were trained on them, which brought about extraordinary competition: "[They] entered into competition with each other to be the first to win a reward from Xerxes for the capture of an Athenian ship" (VIII.10♦). In fact, "every man of them did his best for fear of Xerxes, feeling that the king's eye was on him" (VIII.86♦). We get the impression that the silent dialogue between the king and his soldiers had a bearing on tactical considerations. Thus, during the escape after the battle: "those astern fell foul of them in their attempt to press forward and do some service for their king" (VIII.89♦). The successful outcome of a maneuver executed by the ship of Artemisia of Caria is particularly spicy: in order to disengage during the battle, she rammed a vessel of the royal fleet, but from the shore it appeared as though she had sunk an Athenian vessel—which "raised her . . . higher than ever in Xerxes' esteem" (VIII.88♦).

Even when the king was not present, people were sure that he would be kept informed: "It is for this reason that there were so many men who undertook to run such risks for Cyrus the Younger, thinking every time that he would know about it" (Xenophon, *Anab.* I.9.15). If the king did not learn it directly, one had to hope that the royal inspectors would bring the king a highly favorable report (Xenophon, *Oec.* IV.6–10). A courtier was always ready to portray his exploits in the most spectacular way, as the later example of Datames shows so well (Nepos, *Dat.* 3; chap. 5/5 above).

The Royal Gifts

The Greeks knew very well that entering the service of the Great King brought great opportunities for receiving gifts and presents in return (cf. Herodotus VII.134–37; VIII.5; IX.18, etc.). Xenophon endlessly revisits this feature of royal Achaemenid ideology and practice. This is how he puts it in the *Oeconomicus*: if the officers in charge of the garrisons and their troops do their work well, the king "promotes [them] in the scale of honour (*tais timais auxei*) and enriches with large grants of money (*dōra megalā*)"; the others, however, "he punishes severely, and appoints others to take their office" (IV.7♦). The same was true for the officials in charge of keeping a territory in full production (IV.8). These are the sorts of assumptions on which Xenophon's idealized portrait of Cyrus the Younger is based:

But it was the brave in war, as all agree, whom he honored especially (*diapherontōs timas*) . . . and whomsoever in his army he found willing to meet dangers, these men he would not only appoint as rulers of the territory he was subduing, but would honour thereafter with other gifts (*dōra*) also. . . . As for uprightness, if a man showed that he desired to distinguish himself in that quality, Cyrus considered it all important to enable such an one to live in greater opulence than those who were greedy of unjust gain. . . . Again, so surely as a man performed with credit any service that he assigned him, Cyrus never let his zeal go unrewarded. . . . And surely he of all men distributed gifts most generously among his friends, with an eye to the tastes of each one and to whatever particular need he noted in each case. (*Anab.* I.9.14–22♠)

It is clear that the following portrait of Cyrus the Younger is traced from the portrait that Xenophon drew of Cyrus the Elder:

Though he far exceeded all other men in the amount of the revenues he received, yet he excelled still more in the quantity of presents he made. It was Cyrus, therefore, who began the practice of lavish giving (*polydōria*), and among the kings it continues even to this day. For who has richer friends (*philoi*) to show than the Persian king? Who is there that is known to adorn his friends with more beautiful robes than does the king? Whose gifts are so readily recognized as some of those which the king gives, such as bracelets, necklaces, and horses with gold-studded bridles? For, as everybody knows, no one over there is allowed to have such things except those to whom the king has given them. (*Cyr.* VIII.2.7–8♠)

These royal gifts were well known to the Greeks, who frequently benefited from them. The Classical authors referred to them with such expressions as “which are most prized amongst the Persians” (Herodotus III.160; cf. VII.8♠), “a thoroughly Persian gift” (Herodotus IX.109♠), or “the highest honours, such as were customary [in Persia]” (Diodorus XV.11.2♠). They are sometimes more specific, as was Herodotus regarding Otanes and his descendants: “Every year, a suit of Median clothes and such other gifts as are held to be of most value by the Persians, as a mark of honour” (*tēn pasan dōreēn . . . en Persēisi timiōtatēn*; III.84♠). In turn, Xenophon puts it thus: “Cyrus gave [Syrnensis] gifts which are regarded at court as tokens of honour—a horse with a gold-mounted bridle, a gold necklace and bracelets, a gold dagger (*akinakēs*)” (*Anab.* I.2.27♠). As for Ctesias (§22), he states that “the most outstanding gift the king can give among the Persians is a gold millstone” (*mylē khrysē*). We might wonder about the exact significance of Ctesias’s note, but the expression he uses fits perfectly into a series of cases that imply the existence at the Persian court of a category of gifts, called royal, distinguished from one another in a subtle hierarchy, and conferred on those whom the king wished to honor for “good actions” (cf. Aelian, *VH* VIII.8).

Robes and jewelry are archetypal royal gifts frequently attested in the record. Xenophon’s Cyrus often resorts to them. Before a major parade, he distributes Median robes to “those of the Persians and of the allies who held office. . . . And when he had distributed among the noblest the most beautiful garments, he brought out other Median robes, for he had had a great many made, with no stint of purple or sable or red or scarlet or crimson cloaks,” in such a way that in turn those close to him distributed them to their friends (*Cyr.* VIII.3.1–3♠). It seems clear that the different colors referred to a hierarchy defined by the king (cf. VIII.1.40): some jobs at the central court carried the right (and no doubt the obligation) to wear special robes (Plutarch, *Alex.* 18.8 [*astandēs*]). It is no less clear that wearing them permitted the recipients to vaunt themselves above other Persians. Thus Mithradates, overwhelmed with gifts after the battle of Cunaxa, never

Fig. 43. Achaemenid jewelry.

appeared in public without the robe and jewelry that Artaxerxes gave him. Hence this reflection by a eunuch—at once ironic, envious, and provocative: “A magnificent dress, indeed, O Mithradates, is this which the king has given you; the chains and bracelets are glorious, and your scimitar (*akinakēs*) of invaluable worth; how happy has he made you, the object of every eye!” (Plutarch, *Art.* 15.2◊). Likewise Artapates, the most faithful of Cyrus the Younger’s scepter-bearers, “had a dagger (*akinakēs*) of gold, and he also wore a necklace and bracelets and all the other ornaments that the noblest (*aristoi*) Persians wear; for he had been honoured by Cyrus (*etimeto hypo Kyrou*) because of his affection and fidelity” Xenophon, *Anab.* I.8.29◊). In Persian eyes, in fact, these robes and jewels were not baubles; they were the resplendent marks of the king’s favor granted to them in return for services rendered. Wearing these ornaments meant accession to the rank of Persians most esteemed by the king. Thus, the gift of a Median robe to the city of Acanthus by Xerxes in 480 (Herodotus VII.116) bore a rather different significance; the royal

gift was indeed symbolically charged, but its political implications were far from the practical realities of the Achaemenid court.

With all of the Persian nobles wearing sumptuous robes (e.g., *Anab.* I.5.8) and prize jewelry (e.g., Plutarch, *Cimon* 9.5), we should not be surprised that the ceremony of awarding gifts was held in public. Thus Megabyzus, to whom the king awarded a gift of honor (*geras*), is remembered with these words: "Darius had once paid this man a high compliment . . . it was in Persia that Darius paid him this compliment" (Herodotus IV.143♦). Further evidence is available from the story of Mordecai, who received a royal robe and a horse that "the king has ridden." In order to give its full social value to the royal gift, the king issued the following order: "Lead [Mordecai] through the city square, proclaiming before him: "This is the way to treat a man whom the king wishes to honour'" (Esth 6:8–9♦). Another example of public acclaim is found in the story about Daiphemes' friend's appearance before "Cyrus":

Cyrus gave him one of the horses that were being led in the procession and gave orders to one of the mace-bearers to have it led away for him wherever he should direct. And to those who saw it it seemed to be a mark of great honour, and as a consequence of that event many more people paid court to that man. (*Cyr.* VIII.3.23♦)

Perhaps it was the king who gave the gold breastplate to Masistius, the rider of a Nisaeon horse bridled in gold, described by Herodotus (IX.20–21). The jewelry presented by the king probably bore a distinctive mark, because Xenophon mentions that "no one over there is allowed to have such things except those to whom the king has given them" (*Cyr.* VIII.2.7–8♦). The robes of honor must also have had various special markings, since according to Aelian (VH I.22) the "Median" robes given by the Great King were labeled "given as a present" ("dorophoric"). Aelian (VH I.22♦) records that court customs regulated the value of the gifts offered to the ambassadors sent to the Great King:

The presents given by the king of Persia to envoys who came to see him, whether they came from Greece or elsewhere, were the following. Each received a Babylonian talent of silver coins and two silver cups weighing a talent each (the Babylonian talent is equivalent to 72 Attic minae). He gave them bracelets, a sword, and a necklace; these objects were worth 1,000 darics. In addition there was a Persian robe. The name of this robe was *dorophorikē*.

This text leaves the impression that the gifts of jewelry, precious vessels, and gold were calibrated not just according to their symbolic value but also in proportion to the weight of the precious metal from which they were made. There is also every indication that this custom did not hold only for diplomatic gifts. We need only recall the example of the simple Persian peasant who received from Artaxerxes II "a Persian robe, a golden cup, and a thousand darics" (VH I.32♦).

Gifts and Honors: The Court Hierarchy

Important as they were, robes and jewelry were but one element of the Great Kings' *polydōria*: Cyrus "used to reward with gifts (*dōra*) and positions of authority (*arkhai*) and seats of honour (*timai*) and all sorts of preferment (*hedrai*) others whom he saw devoting themselves most eagerly to the attainment of excellence (*ta kala*)" (*Cyr.* VIII.1.39♦). Nomination to a high position was in itself a mark of royal favor, as in the case of Xenagoras. He had just saved the life of Masistes, and this action won him "the favor (*kharis*) not only of Masistes himself, but also of Xerxes, whose brother he had saved; and he was

rewarded for it by a gift from Xerxes of the governorship of the whole province of Cilicia" (Herodotus IX.107♦).

Obviously, court titles must be included in the category of privileges and honors. Court titles are unfortunately known only from allusions in the Classical sources. We know of "the Friends" (*philoí*); that this was an actual title is implied by the punishment inflicted on Orontes by Artaxerxes II—"exclusion from the company of his Friends" (Plutarch, *Art.* 11.2; cf. Xenophon, *Anab.* IV.4.4; Plutarch, *Art.* 24.9). There was even an internal hierarchy within the category of "Friends," based on the degree of royal favor (Diodorus XVI.52.1). To Histiaeus of Miletus, Darius promised, "Come with me to Susa. All I have will there be yours. You will eat at my table (*syssitos*) and be my counsellor (*symbolos*)" (Herodotus V.24♦). The Greek physician Democedes was himself Darius's Tablemate (*homotrapezos*) (III.131). High Persian aristocrats, such as Megabyzus, also held this title (Ctesias §41: *homotrapezos*).

"Friend" was certainly one of the most coveted court titles. We know in fact that, during certain festivals, many people gathered around the king for the banquet (Athenaeus IV.145c). An example is the banquet given by Ahasuerus in the third year of his reign: "He gave a banquet at his court for all his administrators and ministers" (Esth 1:3♦). This was probably also the case at the "Royal Supper" in honor of the king's birthday (Herodotus IX.110♦). This sort of public banquet is depicted several times by Xenophon in the *Cyropaedia* (cf. VIII.4.1–5). Heraclides' report (Athenaeus IV.145–46) shows that the king generally dined alone in a hall. Some invited guests (the *syndeipnoi*) dined outside, others—still more highly honored (146a; *hoi entimōtatoi tōn syndeipnōn*)—were served in a hall near the royal dining hall. The two halls were separated by a curtain that allowed the king to watch the other side but concealed him from their view. The first group nonetheless accrued considerable prestige, for they dined "in full sight of anyone who wishes to look on" (145b♦). Finally, at the end of the meal, just a dozen or so of the invited guests (the *sympotoi*) were summoned by name by a eunuch and came to a special room to drink in the company of the king—an exceptional honor, because it was during these *symposia* that important matters were discussed (Herodotus I.133; Strabo XV.3.20; Athenaeus IV.144b, V.102c).

It is not certain that the title *homotrapezos* 'Tablemate' was exactly the same as *syndeipnos* 'invited guest'. "Tablemate" was actually a title in the court hierarchy that conferred on its holder a preeminent place before the king. During the battle of Cunaxa, "a very few were left about" Cyrus the Younger, "chiefly his so-called table companions" (*oi homotrapezoi kaloumenoi*; *Anab.* I.8.25♦). The difference between 'Tablemate' and 'invited guest' is clarified by the case of Entimus, which Athenaeus distinguishes from the case of Timagoras. Entimus was invited to the 'luncheon of the Kinsmen' (*to syggenikon ariston*); Timagoras received something from the royal table every day (Athenaeus II.48e): "Not to mention the feast made for [Timagoras] at court, which was so princely and splendid" (Plutarch, *Art.* 22.6♦). Moreover, the two privileges were not mutually exclusive, for Entimus was not merely a *syndeipnos*; he also received necessities every day (Athenaeus II.49a).

This simple example proves that at court there definitely existed a hierarchy of honors. The available texts do not allow us to reconstruct it with certainty, although the title Friend seems to have assumed special importance. We must also beware of confusing titles and duties. Titles that we might expect to be granted to only one person were some-

times held by a great number of people. We must also remain aware of change over time, bearing in mind that most of the sources come from the reigns of Artaxerxes II and Darius III. However, we know from Plutarch that under Artaxerxes I "there happening great alterations . . . at court, and removals of the king's favourites" (*peri tēn aulēn kai tous philous*; *Them.* 29.5♦) at the start of his reign; other innovations were probably introduced by Artaxerxes II (chaps. 14/1; 15/3).

Also to be counted among exceptional honors was marriage to the king's daughter. We know specifically that Darius married his daughters or sisters to high aristocrats, such as Gobryas (Herodotus VII.2). In 499, the Persian forces in Asia Minor were commanded by three sons-in-law of Darius: Daurises, Hymaees, and Otanes (V.116); another son-in-law of Darius, Artochmes, was one of Xerxes' commanders in 480 (VII.73). Shortly before the battle of Salamis, the Greeks took several high Persian aristocrats (*epiphanoi*) prisoner; they included two (or three) sons of Sandauce, a daughter of Darius, and a daughter of Artayctes (Plutarch, *Them.* 13.2; *Arist.* 9.1–2).

A story told by Plutarch well illustrates the importance of matrimonial problems at court:

Artaxerxes [II], having many daughters, promised to give Apama to Pharnabazus to wife, Rhodogune to Orontes, and Amestris to Teribazus; whom alone of the three he disappointed, by marrying Amestris himself. However, to make him amends, he betrothed his youngest daughter Atossa to him. But after he had, being enamoured of her too, as has been said, married her, Teribazus entertained an irreconcilable enmity against him. (*Art.* 27.7–9♦)

It is quite obvious that the status of king's son-in-law exalted the social position of a happy few. When Pausanias of Sparta concluded a treaty with Xerxes, he asked to marry one of Xerxes' daughters (Thuc. I.128). Without even receiving a reply on this matter, he considered himself nonetheless part of the inner circle of the dominant socioethnic class. These marriages are thus noteworthy because they clearly express the king's determination to take on and/or officially sanction the loyalty of the families so designated. But they granted no dynastic right to any sons to be born, as is shown by the arguments over the succession of Darius, reported (in his way) by Herodotus (VII.2–4). As it happens, the wife exchange was unequal, since the sons-in-law owed this familial promotion to the king himself: it was a kingly favor, at the king's sole discretion. The disbursal of his daughters constituted one of the elements of his power. Even assuming that he only gave his daughters to members of the highest nobility, anyone who sought to become his son-in-law would have been well advised to prove his devotion and his unfailing loyalty. The relationship was not an acquired right but a royal gift.

There can scarcely be any doubt that these sons-in-law fell into the category of Royal Kinsmen. This term (*syggeneis*) was itself integrated into the court hierarchy. At the time of Darius III, the Royal Kinsmen constituted a corps of elite horsemen, numbering 10,000, whose courage during the battle of Granicus is underlined by Diodorus (XVII.20.2). At Gaugamela, they fought beside the king (*synagōnisthai*), and Diodorus (XVII.59.2♦) explains the criteria for selection as follows: "These were men chosen for courage (*aretē*) and for loyalty (*eunoia*)." They were distinguished by their dress uniform: their lances bore golden apples, they are *mēlophoroi* (Arrian III.11.5). Among their well-known privileges was wearing the diadem; they also had the right to kiss the king on the lips—a sign of significant social achievement, since we know that for the Persians

only men of equal rank (*isotimoi*) greeted each other in this way (Herodotus I.134; Strabo XV.3.20). In Darius III's procession, Quintus Curtius (III.3.14, 21) differentiates the *cognati* (numbering 15,000) from the *propinqui* (numbering some 200); the latter (*nobilissimi propinquorum*) constituted the picked escort of the royal chariot, and obviously they were included among the various troop units (placed just after the Immortals). It is tempting to suppose that the *propinqui* represented the members and in-laws of the royal family, while the *cognati* corresponded to Diodorus's and Arrian's *syggenis* (court title: *quos cognatos regis appellant*).

But when was this category of *syggenis* created? The Royal Kinsmen are not attested with any certainty during the time of the first kings. The vocabulary of the Greek authors is necessarily ambiguous, mirroring the use of the term itself at court. In 479, Cimon besieged Eion, where there were "some great men (*andres endoxoi*) among the Persians, of the king's kindred" (*syggenis basileōs*; Plutarch, *Cimon* 7.1♦); similarly at Byzantium, where there could be found "some connexions (*prosekontes*) and kinsmen (*syggenis*) of the king," whom Pausanias sent to Xerxes (Thucydides I.128.5♦). The first term clearly refers to family ties (cf. Xenophon, *Anab.* I.6.1). In a passage taken from Phaeonias, Athenaeus reports that Éntimus was invited "to breakfast *en famille*" (to *syggenikon ariston*) during the time of Artaxerxes II (II.48f♦). But once again doubt remains, because Plutarch records that, along with his mother and his wife, the king invited his two brothers, his literal kinsmen, to the table (*Art.* 5.5). Was this an innovation by Artaxerxes II, or was it an arrangement used occasionally by all of the Great Kings (cf. Athenaeus IV.145d)? We may also note that several Aramaic and Akkadian texts (especially from the time of Darius II) refer to the Sons of the House (*br byt'/mār bitī*). This is the term used, for instance, to refer to Aršāma, satrap of Egypt (cf. DAE 62ff. [AD 1–13]). There we also find the phrase 'princes' (*hny byt'*). The two expressions correspond and render a title applied to exalted members of the royal entourage. But was this a real kinship or a court kinship? It is difficult to decide with certainty. In some Persepolis tablets, moreover, the term 'son of the [royal] house' (*misapuša*) indisputably refers to close relatives of Darius (PF 1793; cf. PFa 24, 29). Nonetheless, granting the title "Royal Kinsmen" even to in-laws implies an extension of the vocabulary of true kinship into the context of a court hierarchy.

The First Circle

The highest aristocrats were endowed with court titles. Just as Darius had been Cyrus's quiver-bearer (Aelian, *VH* XII.43) and Cambyses' lance-bearer (Herodotus III.139), so Gobryas and Aspathines are shown bearing royal arms on the façade of Darius's tomb (*DNe-d*). Prexaspes was Cambyses' message-bearer, and his son "was the king's cupbearer—also a position of no small honour" (Herodotus III.34♦). Patiramphes, son of one of several persons who had the name Otanes, was Xerxes' royal chariot-driver (VII.40). Tiribazus had the privilege of assisting the king onto his horse (Xenophon, *Anab.* IV.4.4). Megabyzus was Xerxes' son-in-law and Artaxerxes I's Tablemate (Ctesias §22, 41). In short, the ambition of the king's men was to be incorporated into the immediate proximity of the king—at court, in the army, or even on the hunt (cf. Plutarch, *Them.* 29.6).

The expressions used by the Greeks are very revealing. Cyrus distributed his royal gifts to those whom Xenophon calls *hoi peri auton* (Cyr. VIII.2.8; cf. VIII.1.36 etc.). In Cyrus the Younger's entourage, Xenophon uses the same term (*hoi peri auton*; cf. I.1.5: *hoi par' autōi barbaroi*) for the most powerful (*kratistoi*) and best-dressed Persians, who

were covered with all sorts of jewels (*Anab.* I.8.1). But there also was an inner circle around the king: "the noblest Persians among his attendants (*Persai hoi aristoi hoi peri auton*)," whom he convened to judge Orontas (*I.6.4*♦). Pategyas must have been part of this circle: "a trusty Persian of Cyrus's staff" (*anēr Persēs tōn peri amphī Kyron khrestos*; *I.8.1*♦). Any promotion brought the noble into the circle of cronies, such as Tiribazus after his great deeds during a campaign against the Cadusians, who "set out homewards in the company of the king" (*meta basileōs*; Plutarch, *Art.* 24.9♦), whereas earlier, he stagnated "in humble estate and neglected" (*24.4*♦). He had already previously benefited from royal favor, since he was constantly at the side of the king (*kai hopotē pareiē*; Xenophon, *Anab.* IV.4.4). Likewise Mardonius, "who was part of the entourage of Xerxes" (*par'autōi*; Herodotus VII.5). And, at the beginning of each reign, Ctesias is careful to include the names of the most influential people around the king (*megistos/dynatos/megas/iskhys par'autōi*) (§9, 20, 29, 45, 53).

In other words, the king's favor was expressed by the degree of proximity one had attained with respect to his person: hence the importance of titles that refer to relations of kinship (*syggeneis*) or familiar trust (Friend), to sharing of meals (Tablemate), to a position that implies being in the king's presence (cupbearer, charioteer, royal arms-bearer, scepter-bearer, etc.). This concentric manifestation of royal favor was realized in three dimensions by Alexander at Opis (*Arrian* VII.11.8) and imitated a few years later by Peucestes at Persepolis, who placed the participants in four concentric circles around the altars; the innermost circle encompassed "the generals and hipparchs and also each of the Persians who was most highly honoured" (*tōn Persōn hoi malista timōmenoi*; Diodorus XIX.22.2–3♦). This royal hierarchy was maintained during all of the activities of the court, including banquets. In the *Cyropaedia*, Xenophon stresses this especially. When his Cyrus gave a victory banquet, "he invited in those of his friends who showed that they were most desirous of magnifying his rule and of honouring him most loyally" (VIII.4.1):

So when the invited guests came to dinner, he did not assign them their seats at random, but he seated on Cyrus's left the one for whom he had the highest regard (*hos malista etima*), for the left side was more readily exposed to treacherous designs than the right; and the one who was second in esteem he seated on his right, the third again on the left, the fourth on the right, and so on, if there were more. For he thought it a good plan to show publicly how much regard he had for each one (*hōs ekaston etima*), because where people feel that the one who merits most will neither have his praise proclaimed nor receive a prize, there is no emulation among them; but where the most deserving is seen to receive the most preference, there all are seen to contend most eagerly for the first place (*agōnisai*). Accordingly, Cyrus thus made public recognition of those who stood first in his esteem. . . . And Cyrus felt it a discredit to himself, if the one who sat in the seat of highest honour was not also seen to receive the greatest number of good things at his hands. (VIII.4.3–5♦)

Surely here as elsewhere Xenophon is extolling (through Cyrus) government by the elite, something that he desired for Athens. Meanwhile, the information that he gives on the organization of the royal table is confirmed by much other evidence and therefore acceptable overall.

An identical hierarchy was in effect in the field. According to Xenophon, Cyrus imposed very strict regulations in this area. "At the very beginning Cyrus made this rule, that his tent should be pitched facing the east; and then he determined, first, how far from the royal pavilion the spearmen of his guard should have their tent" (VIII.5.3♦). Contrary to what Xenophon's version implies, Cyrus's reasons were not strictly or solely

military: "His position in the middle of the camp in the belief that this situation was the most secure. Then came his most trusty followers (*πιστότατοι*), just as he was accustomed to have them about him at home, and next to them in a circle he had his horsemen and charioteers" (5.8♦). It was the same in battle. Principle required the king to be at the center of the troop disposition. The same was true in the (informal) council that the king convened (when he considered it useful). In one of these meetings, for example, after Xerxes, Mardonius took the floor (Herodotus VII.9), who "had more influence with Xerxes than anyone else in the country" (VII.5♦). When he conferred with the heads of the naval contingents before the battle of Salamis, the protocol was no less minutely regulated: "When he had seated himself with all proper ceremony, the rulers of states and commanders of squadrons were summoned to appear before him, and took their seats according to the degree of privilege which the king had assigned them. . . . They sat there in order of rank" (VIII.67–68♦).

Gifts and Redistribution of Wealth

The relationship between the king and his men was also based on the wealth of material advantages they received from him. Some gifts—striking testimony to royal favor—could reflect an often considerable intrinsic economic value. This fact did not escape the Greek authors, who were struck by the luxurious lifestyle of the king and his satraps. That is what Herodotus sought to make his readers understand by recounting the marvelous tale of the physician Democedes, who came to treat Darius for a sprain and was also sent to tend some women:

They each scooped a cupful of gold coins from a chest and gave them to Democedes. There was such a lot of the money that a servant called Sciton, by picking up the coins which spilt over from the cups, managed to collect quite a fortune. (III.130♦)

Darius provides us with another incident. When he was urging Histiaeus (tyrant of Miletus) to accompany him to Susa, he not only promised him that he would be his Tablemate and his counselor but also encouraged him in this way: "All I have will there be yours" (V.24♦). Phaenias of Ephesus records another case, that of Entimus the Cretan, who switched his allegiance to the Great King and received exceptional honors:

In his honour Artaxerxes bestowed upon him a tent of extraordinary beauty and size, and a silver-footed bedstead; he also sent rich coverings. . . . The king sent Entimus a silver-footed bed with its coverings, a tent with gaily-coloured canopy, a silver throne, a gilded sunshade, twenty gold saucers set with jewels, one hundred large saucers of silver and silver mixing-bowls, one hundred concubines and one hundred slaves, and six thousand pieces of gold, beside all that was given to him for his daily necessities. (Athenaeus II.48d-f-49a♦)

We also know that ambassadors received regular gifts from the Great King (Aelian, *VH* I.22). The Greeks were all the more aware of this because quite a few ambassadors to the Great King were accused, on their return, of *parapresbeia*, that is, of allowing themselves to be bribed. In 425, Aristophanes alluded to this very clearly in the *Achamians* (50ff.). Timagoras, ambassador to the Congress of Susa in 369, is mentioned by Athenaeus as having received numerous gifts from Artaxerxes II (II.48e): "And indeed the Athenians condemned Timagoras to death for taking bribes" (Plutarch, *Art.* 22.6; *Pel.* 30.9–13). Conon the Athenian, around 395, was himself honored with magnificent gifts (*dōreai megalai*): "Artaxerxes approved Conon, honoured him with rich gifts, and appointed a paymaster who should supply funds in abundance as Conon might assign them" (Dio-

dorus XIV.81.6♦). This may have been the occasion on which Demos, son of Pirylampes, received a *symbolon* from the Great King in the form of a gold phial, which he used as security for a 16-mina loan (Lysias XIX.25).

There are also two Persepolis tablets, dated 492 and 486, that attest to the distribution of silver to worthy persons. One of them (PT 4) records that on the king's direct order the sum of 5,300 shekels of silver was distributed to thirteen Persians. Some received 60 shekels, others 50, others 30, and others 20. It is hard to identify these people because their names are common. And these were no small gifts: at that time, a sheep was worth 3 shekels; a 300-shekel gift thus corresponds to 100 sheep. To verify this, all we need to do is note the total daily "ration" of sheep (2 head) received by Parnaka, Darius's chief administrator in Persia. The reason for this royal order is doubtless to be found in the next tablet (PT 5), which records the distribution of 9,040 shekels to 113 "cowboys" (?), at the rate of 80 shekels per man. These men were paid in this fashion for seizing a certain Antaka in the region of Tauka. Although various uncertainties about the underlying narrative remain, we can recognize Benefactors among the persons so honored.

The profits of conquest also enriched the king's men. Several of them received concessions of land, which yielded substantial income. Several times Xenophon says that Cyrus divided the booty and spoils of war among his inner circle and his soldiers. The division was undoubtedly unequal, with the king retaining for himself the entire treasuries of conquered kings. But there is also no doubt that the royal favorites got their hands on riches—such as Bagoas, an intimate of Artaxerxes III, who grabbed a quantity of gold and silver taken from the Egyptian temples and then sold back to the priests at an exorbitant price the "ancient sacred annals" that he had just stolen from them (Diodorus XVI.51.2)!

The position held by a satrap was also quite remunerative. Sometimes, the king granted the right of not transferring tribute to the central court. This was the case for Bardiya in Central Asia (Ctesias §8: *ateleis*) and for Zopyrus after his (supposed) exploit in Babylon: Darius granted him the governorship of Babylon, free from tax (*ateleia*), for as long as he lived" (Herodotus III.160♦; cf. Diodorus II.28.4). A satrap also profited from the revenues of his paradise (cf. Xenophon, *Hell.* IV.1.15–17, 33), and he levied a special duty for the purpose of supplying his table (chap. 10/4). He also undoubtedly enjoyed other more irregular (in every sense of the term) revenues. Even though satraps were supervised, we may assume that more than one was tempted to levy a higher tribute than he was obliged to remit each year to the central court. The offering of *baksheesh* (bribes) is regularly mentioned; for example, the parties to a suit tried in this way to sway a governor's decision (cf. *DAE* 102, 104 [AP 30–31, 33]; Ezra 5:3–4). We may also cite the example of Condalus, high-level administrator of Mausolus, satrap of Caria in the fourth century:

Whenever during his passage through the country anyone brought him a sheep or a pig or a calf, [he] used to make a record of the donor and the date and order him to take it back home and keep it until he returned. When he thought that sufficient time had elapsed, he used to ask for the animal which was being kept for him, and reckoned up and demanded the produce-tax on it as well. (Ps.-Arist., *Oecon.* II.14a♦)

Condalus's game confirms that satraps and their lieutenants received gifts apart from their periodic inspections. But this was a matter of extorted gifts, which counts as theft pure and simple.

The court titles themselves implied material benefits. First of all, becoming a part of the inner circle made an individual an intermediary to the king, thus someone to be lobbied by means of presents. This explains Xenophon's remark about Gadatas, 'chief of the mace-bearers' (*skēptoukhoi*) at Cyrus's court: "In return for his services he received many valuable presents from Cyrus himself and, through Cyrus's influence, from others also" (*Cyr.* VIII.4.2♦). Some associates of the Great King did not hesitate to profit from their activities. For instance, Satibarzanes, royal chamberlain in the time of Artaxerxes II, was punished for receiving silver from the Cypriot king Evagoras (*Plutarch, Mor.* 173e; *Ctesias* §63). We also know that royal judges were put to death for rendering decisions for pay (*Herodotus* V.25; cf. *Diodorus* XV.10.1).

The royal table (in the administrative sense), symbolic of the territorial and material power of the Great King, was a preeminent location for redistribution, in the form of precedence (when one was invited to take a meal with the king) and in the form of distribution of provisions. Xenophon comes back to this several times. In his eyes, the custom related to royal *polydōria*:

[Cyrus] recognized from the start that there is no kindness which men can show one another, with the same amount of expenditure, more acceptable than sharing meat and drink with them. In this belief, he first of all arranged that there should be placed upon his own table a quantity of food, like that of which he himself regularly partook, sufficient for a very large number of people; and all of that which was served to him, except what he and his companions at table (*syndeipnoi*) consumed, he distributed among those of his friends (*philoï*) to whom he wished to send remembrances or good wishes. . . . He used also to honour with presents from his table any one of his servants whom he took occasion to commend. . . . He often saw him send even to some of his friends who were not there something that he happened to like very much himself. (*Cyr.* VIII.2.2-4; 4.6♦)

This was also one of the qualities that Xenophon recognized in Cyrus the Younger, who when he "got some particularly good wine, he would often send the half-emptied jar to a friend. . . . So he would often send halves of geese" (*Anab.* I.9.25-26♦; cf. *Aelian, VH* XII.1). Xenophon again says that the same instructions were given to the satraps: "Let your table, like mine, feed first your own household and then, too, be bountifully arrayed so as to give a share to your friends and to confer some distinction day by day upon any one who does some noble act" (*Cyr.* VIII.6.11♦). *Nehemiah* 5:17♦ tells us that the governor's table in Judah supplied 150 men every day, Jews and officials, "not to mention those who came to us from the surrounding nations."

These distributions were thus of considerable magnitude. Everyone knows the famous description given by the redactor of *Esther* (1:3-8♦):

In the third year of his reign, [Ahasuerus] gave a banquet at his court for all his administrators and ministers, chiefs of the army of Persia and Media, nobles and governors of the provinces. Thus he displayed the riches and splendour of his empire and the pomp and glory of his majesty; the festivities went on for a long time, a hundred and eighty days.

When this period was over, for seven days the king gave a banquet for all the people living in the citadel of Susa, to high and low alike, in the enclosure adjoining the king's palace. There were white and violet hangings fastened with cords of fine linen and purple thread to silver rings on marble columns, couches of gold and silver on a pavement of porphyry, marble, mother-of-pearl and precious stones. For drinking there were golden cups of various designs and the royal wine in plenty according to the king's bounty. By royal command,

however, drinking was not obligatory, the king having instructed the officials of his household to treat each guest according to his own wishes.

It would be tempting to form the obvious conclusion that this is an "oriental legend." However, according to Dinon and Ctesias, whom we have every reason to consider credible, the number of persons served at the Great King's table every day reached 15,000 (Athenaeus IV.146c). These figures are not surprising: Sargon of Akkad boasted of feeding 5,400 men every day (ANET³ 268); Aššurnasirpal II records that he gave a huge banquet in which several tens of thousands of people took part: 69,574 for ten days, including 5,000 high dignitaries from conquered countries, 16,000 people of uncertain status, and 1,500 crown officers, along with 47,074 male and female laborers who had just worked on the construction of the new capital (ANET³ 560).

Obviously, not all of the people fed found a place at the royal table. According to Heraclides, "the greater part of these meats and other foods are taken out into the courtyard for the body-guard and light-armed troopers maintained by the king; there they divide all the half-eaten remnants of meat and bread and share them in equal portions" (Athenaeus IV.145e◊; Polyacnus IV.3.32). But aside from these distributions to the soldiers—which Heraclides considered part of their pay (*misthos*)—dishes were sent to persons the king wished to honor, such as Timagoras: "Not to mention the feast made for him at court, which was so princely and splendid" (Plutarch, *Art.* 22.6◊); or Entimus: "some of the food served to the king was merely sent to him from the table" (Athenaeus II.48e◊; cf. 49a). The economic value of these distributions is illustrated well in a story told by Herodotus (the execution of Psammenitus's children; III.14).

To the actual food provided must be added all of the equipment needed for banquets, such as silver-footed couches, tent, blanket, parasol, cups, and staff provided to Entimus (II.48f–49a), or the couch and blanket sent to Timagoras (Plutarch, *Art.* 22.10; *PeI.* 30.10). The custom is also found in the Hellenistic era. Poseidonius records that at the conclusion of the great banquets given every day by the Seleucid king Antiochus VII, "Every one of the feasters would carry home uncarved meat of land-animals, fowls, and creatures of the sea prepared whole, and capable of filling a cart; and after all that, quantities of honey-cakes and wreaths of myrrh and frankincense with matted fillets of gold as long as a man" (Athenaeus XII.540c◊)!

Among the gifts offered by Artaxerxes to the Athenian ambassador Timagoras, Plutarch mentions the following: "Since [Timagoras] needed cow's milk for his health, [Artaxerxes] sent 80 cows after him to milk . . . and cowherds" (*Art.* 22.10; *PeI.* 30.10). This passage makes perfect sense in light of the Persepolis tablets and in turn helps to explain them. A number of Fortification tablets refer to the issuing of food rations, not just to workers (*kurtasš*) but also to administrators and several high figures in the king's entourage: daily rations or travelers' rations were received from the administration by order of the king or the head of economic administration, Parnaka. The study of these tablets shows that here too there was a hierarchy of gifts of an economic nature. This practice was inherited from the Near Eastern monarchies: "The master did not eat alone, and his meal was not solely for nourishment. The Mesopotamian man was required to share his meal, to offer sustenance. . . . Was not the king 'the one who feeds the people, table of the race'? . . . The king maintained the palace personnel and the troops" (J. Bottéro).

2. Unequal Exchange

Gifts and Services

The principle was simple: gifts were given by the king in return for services rendered. This was a reality expressed in all of the texts. "In Persia, any special service to the king is very highly valued," Herodotus remarks (III.154♦). The variety of services is very wide: saving the life of the king (Tiribazus: Diodorus XV.10.3) or of a relative (Herodotus IX.107); generally showing bravery in war and subtlety in council (Diodorus XV.10.3; Nepos *Paus.* 1.2); defending to the death a citadel entrusted by the king (Herodotus VII.105–7); accomplishing a brilliant feat in the presence of the king (III.160; IV.143; VIII.85, 87–88, 90; Plutarch, *Art.* 24.9); and so on. In short, to repeat Xenophon's formulation, if "any one in the olden times risked his life for the king, or if any one reduced a state or a nation to submission to him, or effected anything else of good or glory for him, such an one received honour and preferment (*hoi timōmenoi*)." This same Xenophon pretended to be heartbroken when in his time even morally repugnant acts could be rewarded: "If any one seems to bring some advantage to the king by evil-doing, . . . such are the ones who now have the highest honours heaped upon them" (*hoi tais megistais timais gerairomenoi*; *Cyr.* VIII.8.4♦).

By giving awards and honor, the king intended to sustain the unflinching devotion of the men who served him. If for Xenophon so many men were faithful to Cyrus (the Younger), it was "because they thought that if they were deserving, they would gain a worthier reward with Cyrus than with the King" (*Anab.* I.9.29♦). This was indeed the function that the same author recognized for Cyrus the Elder's *polydōria* (*Cyr.* VIII.2.9). In his eyes, the distribution of reward-gifts was neither more nor less than a profitable investment. In this way—Xenophon has Cyrus say to Croesus—I "satisfy the wants of my friends; and by enriching men and doing them kindnesses I win . . . their friendship (*philia*) and loyalty (*eunoia*), and from that I reap as my reward (*karpousai*) security and good fame" (*Cyr.* VIII.2.22♦). The promise of reward was actually a powerful motivation, as, for example, during the five-year preparation and mustering of the grand army of Xerxes:

All the Persian nobles who had attended the conference hurried home to their respective provinces; and as every one of them hoped to win the reward which Xerxes had offered, no pains were spared in the subsequent preparations. . . . Which of the Persian provincial governors received the king's prize for the best-equipped contingent, I am not able to say; nor do I even know if the matter was ever decided. (Herodotus VII.19, 26♦)

The Persians often weighed their merits against royal expectations: for example, Mitrobates and Oroetes (Herodotus III.120) or Masistes and Artayntes (IX.107). Emulation (*agōnisai*) was the foundation of the system, as Xenophon often insists.

Evaluation of Services

Rendering justice, for the king, came down to balancing good deeds against evil acts. For example, this is the basis for the grant of clemency to the royal judge Sandoces: "Darius came to the conclusion that his services to the royal house outweighed his offences, and realizing in consequence that he had acted with more promptitude than wisdom," he let him go (Herodotus VII.194♦). In fact, custom "forbids even the king himself to put a man to death for a single offence. . . . Their way is to balance faults (*ta adikēmata*) against services (*ta hypourgēmata*), and then, if the faults are greater and more numer-

ous, anger may take its course" (I.137♦). This is precisely the quality of which Darius boasts at Naqš-i Rostam (*DNb* §8b). In other words, the prime criterion for judgment was dynastic loyalty.

This is the system that Diodorus Siculus portrays during the trial of Tiribazus, whom Orontes accused of plotting secession (*apostasis*) from the Empire of Artaxerxes II. The king convened the royal judges, who decided that the accused was innocent (XV.8.3–5). At the end of the trial, the judges were interviewed one by one by the king:

The first said that he observed the charges to be debatable, while the benefactions (*euergetiai*) were not contested. The second said that, though it were granted that the charges were true, nevertheless the benefactions exceeded the offences (*hammatia*). The third stated that he did not take into account the benefactions, because Tiribazus had received from the King in return for them favours and honours (*kharites kai timai*) many times as great, but that when the charges were examined apart by themselves, the accused did not appear to be guilty of them. The King praised the judges for having rendered a just decision and bestowed upon Tiribazus the highest honours (*hai nomizomenai megistai timai*). (Diodorus XV.11.1–2♦)

The Tiribazus example shows very clearly that the king remained fully in control of the entire process. It was necessary first of all that the feat that had been performed was recognized as such by the king. This is why, for example, the courtiers took care to inform themselves in advance of the desire of the king—neither Coes (Herodotus IV.97) nor Zopyrus (III.154) failed to do this. Before attempting a brilliant feat against Babylon, Zopyrus "went to find Darius and asked him if it was his heart's desire that Babylon be taken." Coes, before offering his suggestion, "determined ahead of time whether Darius would be interested in hearing a suggestion." This is no doubt the explanation for a Persian practice (*nomos*) presented by Aelian (*VH* XII.62♦) as follows:

Another Persian custom. If someone is about to advise the king on secret or difficult matters, he stands on a gold brick. If his proposal is thought to be necessary, he takes the brick as the reward for his advice and leaves. But he is nevertheless whipped for having contradicted the king.

As Aelian puts it very clearly (*VH* I.31♦), it was in fact up to the king to accept or not accept the offerings that the common peasants of Persia brought him: "These objects . . . are termed gifts (*kai onomazetai dōra*); the king treats them as such (*kai dokei toutōi*)." This is why the gift of some drops of water earned for the peasant Sinetes "a Persian robe, a golden cup, and a thousand darics" from Artaxerxes II (I.32♦), and a simple soldier was honored by Xerxes with the title Benefactor (XII.40).

Gifts with Strings Attached

One could clearly argue that people obtained favors who had previously rendered services (cf. Herodotus IV.115). This is shown by the example of Syloson, as recorded by Herodotus (III.139–140). During Cambyses' Egyptian expedition, Syloson the Greek offered a purple mantle to Darius. After the accession of Darius, Syloson hoped to profit from his gift and reminded Darius that he was one of his Benefactors. However, no one could demand a royal gift in return for services, on one's own terms. This is the moral of the story of Pythius. During Darius's passage through Asia Minor in 513, this extremely wealthy person had already offered magnificent gifts to the king (Herodotus VII.27). With the arrival of Xerxes in 480, he treated the entire army with generosity and he offered the king considerable sums for the success of the war. This gained him the

following royal proclamation: "Therefore, as a reward (*anti autōn*) for your generosity, I make you my personal friend (*xēinos*) and, in addition, I will give you from my own coffers the 7000 gold Darics which are needed to make your fortune up to the round sum of 4,000,000. Continue, then, to possess what you have acquired; and have the wisdom to remain always the man you have proved yourself to-day. You will never regret it, now or hereafter" (VII.29♦). Pythius made the mistake of taking these words as a formal agreement that the king would grant him whatever he requested. A little later, he sought out Xerxes. "Emboldened by the presents he had received," he expressed a desire for another royal gift. Xerxes promised to grant it. Pythius then asked the king to exempt one of his sons from military service. Infuriated by such an outrageous request, Xerxes ordered one of Pythius's sons to be sacrificed under particularly horrific conditions (VII.38–39♦). In other words, services rendered did not tie the hands of the king, who had the prerogative of choosing the nature and timing of the reward.

Another example is the fate reserved by Artaxerxes II for two warriors at the battle of Cunaxa. Arguing that he had unhorsed Cyrus, a Carian "su[ed] for his reward" (Plutarch, *Art.* 14.6♦). The king granted him a gift. The Carian made the mistake of publicly showing his annoyance at not having been rewarded more generously; quite irritated, the king sentenced him to death (14.7–10). The same soon happened to Mithradates, "who first wounded" Cyrus; he received royal gifts (robe and gold jewelry) with this proclamation: "The king has honoured you with these his favours, because you found and brought him the horse-trappings of Cyrus" (14.5♦). Mithradates was annoyed and soon boasted during a banquet that he had killed Cyrus with his bare hands (§15); he was thereupon condemned to the horrible torture of the troughs, for by his bragging he had cast doubt on the official version, which attributed the mortal blow to the king himself (§16).

We are thus not in a context where gifts and counter-gifts were being exchanged between equals, in which "there is a functional relationship between the gift and the response, the gift being only one element in a system of reciprocal benefits that are simultaneously free and constraining, the freedom of the gift obliging the recipient to a counter-gift, giving rise to a continual back-and-forth of gifts given and gifts in compensation" (É. Benveniste). The Achaemenid principle is that only the king gives, and only royal gifts place obligations on the recipient. This is the explanation for the aphorism that Plutarch attributes to Artaxerxes I: he "used to say that it is more kingly to give to one who has than to take away (*to prostheinai tou aphelein basilikōteron esti*)" (*Mor.* 173d♦). Thucydides contrasts the Thracian (Odrysian) and Achaemenid practices: "There was here established a custom opposite to that prevailing in the Persian kingdom, namely, of taking (*lambanein*) rather than giving (*didonai*) . . . it being impossible to get anything done without a present. It was thus a very powerful kingdom" (II.97.3–4♦). Thucydides' proposed contrast is a bit artificial, for the Persian kings also received gifts (cf. esp. Plutarch, *Art.* 4.4–5). But according to the rationale of the system, Thucydides' remark was legitimate. In this system, the Great Kings' *polydōria* was one of the constituent elements of their power, in the sense that the gifts or services received did not further commit the king, although the receipt of honors and royal gifts did oblige the recipient. This was no doubt the source of Democedes' hesitation: at first, he refused to assist the king (III.131). Even though Herodotus states, "I do not myself believe that Darius' motive . . . was anything but genuine and straightforward," he also notes that Democedes did not

"accept with open arms everything Darius offered," for he well knew that doing so would obligate him to return to the Great King's court (III.135♦), which was certainly not his intention (III.132, 136). For Democedes, receiving goods and titles ("Tablemate") signified perpetual commitment to the Great King. The same principle operated in the relations established between Alexander and the Athenian Phocion: Phocion responded to Alexander's offer of towns with a refusal. "Alexander was displeased, and wrote back to him to say that he could not esteem those his friends who would not be obliged by him" (Plutarch, *Phocion* 18.6♦; cf. *Alex.* 39.4 and Aelian, *VH* 1.25). In another case, it is clear that when Darius invited Histiaeus to Susa to be his counselor and Tablemate, he left him no choice in the matter (Herodotus V.24).

There seem to be only two exceptions to the rule. Herodotus says that once a year there was what he calls the "Royal Supper," whose Persian name he gives (*tykta*; IX.110♦), and he states: "It is the one occasion in the year when the king washes his head and gives presents to the Persians." The latter detail poses a problem. It can be compared with several passages in which Xenophon mentions that, each time Cyrus came to Persia, he gave the gifts customary among the Persians (*Cyr.* VIII.5.21; 7.1). Specifically, we know that, during every stay at Persepolis, the Great King had to give a gold piece to the women of Persia (Plutarch, *Alex.* 69.1–2; *Mor.* 246a–b) in memory of the role that they had played during the first confrontation with the Medes (*FCrH* 90 F66.16–45). But Herodotus's remark can be satisfactorily explained by a detail that comes later: "The law (*nomos*) of the Supper demanded that no one, on that day, might be refused his request" (IX.111♦).

Custom also required that on the day of his official recognition "the heir apparent to the crown should beg a boon (*dōron*), and that he that had declared him so should give whatever he asked, provided it were within the sphere of his power" (*anper ē dumatōn*) (Plutarch, *Art.* 26.5♦). The rest of the story shows the importance of the qualification "if it were within the sphere of his power." The eldest son of Artaxerxes, Darius, requested Aspasia, the old companion of Cyrus the Younger: "He gave him her indeed, being constrained by law (*nomos*), but when he had done so, a little after he took her from him. For he consecrated her priestess to Diana of Ecbatana . . . that she might spend the remainder of her days in strict chastity" (27.3–4♦; cf. 28.2).

A Precarious Favor

The position of the recipients was certainly not stable, because royal gifts and favors were by definition insecure. Speaking of places of honor at banquets reserved by Cyrus for his favorites, Xenophon states this reality, without beating around the bush: "He did not, however, assign the appointed place permanently, but he made it a rule that by noble deeds any one might advance to a more honoured seat, and that if any one should conduct himself ill he should go back to one less honoured" (*Cyr.* VIII.4.5♦). The same author returns to this idea in the *Oeconomicus*: though the king confers honors on worthy persons, "those officers whom he finds to be neglecting the garrisons or making profit out of them he punishes severely, and appoints others to their office" (IV.7♦).

Whatever the nature and size of the gifts and honors received, they could only be retained if the king continued to hold the recipient in high regard—whether court title, decoration, administrative post, or gift of land. Let us take the case of Histiaeus of Miletus. For services rendered during Darius's expedition beyond the Danube, he received

the region of Myrcinus in Thrace from the king, "because he wished to found a city there" (Herodotus V.11, ⇨ 23: *dōreēn*). But soon Megabazus warned Darius that it was dangerous to grant Histiaeus this region "with its silver mines, and abundance of timber for building ships and making oars . . ." (V.23⇨). Won over by Megabazus's arguments, Darius recalled Histiaeus to Susa, giving him hope of becoming one of his intimates. Histiaeus obeyed the royal command "and was much flattered at being a King's Counsellor" (V.24⇨).

The specific example of Histiaeus is only an illustration of a general practice: lands conceded as a gift carried an insecure title, not a title to private property in the full meaning of the phrase. They could be confiscated whenever the concessionaire disobeyed royal orders (Xenophon, *Cyr.* VIII.1.20). Babylonian tablets from the time of Darius II attest to the revocation of a previous concession granted to a man who turned out to be disloyal. The same certainly was true for court titles (see Ctesias §41) and gifts of honor. In Athenaeus's long disquisition on drinking vessels, Ctesias mentions, for example, that anyone branded with disgrace (*atimia*) by the Great King had to use clay cups (Athenaeus XI.464a) instead of the opulent vessels of gold and silver reserved for the king and his Tablemates (Herodotus VII.119). Even when gifts and honors were granted for the lifetime of the beneficiary (Herodotus III.160) or were transmissible to his heirs (cf. VII.106), it was implicit that their retention depended on future services rendered.

Examples of chaotic careers are legion. Let us first consider the case of Megabyzus II, known especially from the fictionalized tale by Ctesias. He was the scion of a prominent family, since through his father, Zopyrus I, he was grandson of Megabyzus I, one of the Seven conspirators of 522 (Herodotus III.153, 160; DB §68). Megabyzus was one of the most influential men around Xerxes; he had wed Xerxes' daughter Amytis, who was known for her fickleness (Ctesias §21, 28; cf. Athenaeus XIII.609a). On the expedition of 480, he commanded one of the three divisions of the army (Herodotus VII.82, 121). When the expedition returned in 479, he put down the revolt in Babylonia—in return for which "Xerxes gave him many presents, notably a heap of gold amounting to six talents; this was the most honorable present among all the royal gifts" (§22). He played a very important role during the accession of Artaxerxes (§30), then won a victory over the Athenians and Egyptians in Egypt (§§33–35). Despite the promises of Megabyzus, the king permitted Amestris to put the Greek mercenaries to death. Displeased, "Megabyzus broke with the king" (§§36–37). He achieved several victories over the armies sent against him (§§37–39), before receiving a royal pardon (§39). Then came the famous episode during a hunt:

The king went hunting and a lion attacked him. As soon as the beast leapt, Megabyzus struck him with a javelin and brought him down. The king was angry because Megabyzus had struck the beast before he could touch it himself; he ordered Megabyzus's head cut off, but, on the pleas of Amestris, Amytis, and others, Megabyzus escaped death by being exiled on the coast of the Red Sea (Persian Gulf), at Kyrta. Exile was also pronounced against the eunuch Artoxares, who was sent to Armenia for frequently speaking freely to the king on behalf of Megabyzus. (§40)

Megabyzus returned after five years: "Thanks to Amestris and Amytis, the king allowed himself to relent and made him his Tablemate (*homotrapezos*) as before; he died at 76, and the king was greatly moved" (§41).

The fourth-century career of Datames provides a contrasting example. After his victory over the Paphlagonian Thuys, he was rewarded with "magnificent presents," and he was made equal in command with Pharnabazus and Tithraustes (Nepos, *Dat.* 3.5). The rapidity of Datames' recent victory in Cataonia "gained high favour with [Artaxerxes] (*magnam benevolentiam regis*), [but] he incurred equally jealousy from the courtiers, . . . who united in a conspiracy to ruin him" (§5.2♠). He was warned of the plot by Pandantes, who was "keeper of the royal fortune" and who warned him that "it was the habit of kings to attribute disasters to men but success to their own good fortune; that consequently they were easily led to bring about the ruin of those who were reported to have suffered defeat" (§5.3–4♠). Then came the revolt, the traps, the betrayals, and the end.

The course of the career of Tiribazus is equally enlightening. He first appears at the battle of Cunaxa. It was he who advised Artaxerxes to do battle with Cyrus the Younger (Plutarch, *Art.* 7.3), and he was the one who during the battle provided another horse to the king after he had been thrown from his own (10.1). Shortly thereafter, Xenophon refers to him as governor of western Armenia (*Anab.* IV.4.4♠), but perhaps he had gained that position earlier. Or more likely, the unusual position he held resulted from his conduct during the battle of Cunaxa: he "had proved himself a friend (*philos*) to the King and, so often as he was present, was the only man permitted to help the king mount his horse." Around 392, he was commander-in-chief (*karanos*) of the Persian armies in Asia Minor (and perhaps satrap). In this role he received Greek ambassadors; he refused to come to agreement, arguing that he could not do so "without the King's approval." Then he had Conon arrested and went to find the king (Xenophon, *Hell.* IV.8.12–16♠). Though replaced in his administrative post by Struthas, he still retained major responsibilities in Asia Minor (V.1.6). In 387, when the Greeks met at Susa, it was he who read out the royal proclamation (V.1.30).

He appears again at Cyprus, where he commanded all the Persian forces against Evagoras. He was soon accused by Orontes, who was "jealous of his fame." The king put a certain degree of trust in Orontes' letter of accusation and had Tiribazus arrested (Diodorus XV.8; cf. Polyaeus VII.14.1). According to Diodorus, Tiribazus was kept in prison until the return of Artaxerxes II from his expedition against the Cadusians (XV.8.5; cf. 10.1). Plutarch, on the other hand, gives that impression that Tiribazus accompanied the king. But, doubtless because of the charges against him, he stagnated "at that time in humble estate and neglected" (*Art.* 24.4♠). His diplomatic skill made him "deliverer of the king and his army," which won him a new, lightning promotion: "Teribazus, in great honour and distinction, set out homewards in the company of the king (*meta tou basileōs*)" (24.9♠). It was apparently at this time that the trial was held. The royal judges dismissed the charges against him because of prior services rendered to the king (Diodorus XV.11.1). Artaxerxes "bestowed upon Tiribazus the highest honours, such as were customary [in Persia]" (11.2♠).

Among his past services, Tiribazus emphasized the one that "had won him the admiration and distinction of First Friend of the king (*megisthos genesthai philos*). During a hunt, two lions leaped toward the king in his chariot; they had torn apart two horses of the team of four and were about to pounce on the king when Tiribazus appeared, killed the lions, and so saved the king from great harm" (10.3). Plutarch, on the other hand, though recognizing Tiribazus's courage, several times condemns him for

his foolishness. He apparently is referring to a different hunt when he describes Tiribazus as "a man often in great favor (*prôtē*) with his prince for his valour and as often out of it for his buffoonery" (24.4♦). He also reports that, during another hunt, the king's robe was torn; at Tiribazus's request, the king donned a new robe and gave him the old one but forbade him to wear it: Tiribazus,

little regarding the injunction, being not a bad, but a lightheaded, thoughtless man, immediately the king took it off, put it on, and bedecked himself further with royal golden necklaces and women's ornaments, to the great scandal of everybody, the thing being quite unlawful. (5.4♦)

The Great King chose to approach this guilty extravagance with irony.

This fellow's end, like that of Datames, took place in the context of the affairs of court. He was infuriated by the refusal of the king to give him one of his daughters:

Tiribazus entertained an irreconcilable enmity against Artaxerxes. As indeed he was seldom at any other time steady in his temper, but uneven and inconsiderate; so that whether he were in the number of the choicest favorites of his prince (*homoia tois prōtois*), or whether he were offensive and odious to him, he demeaned himself in neither condition with moderation (*metabolē*), but if he was advanced (*timōmenos*) he was intolerably insolent, and in his degradation not submissive and peaceable in his deportment, but fierce and haughty. (27.9–10♦)

He pressured Darius, the crown prince, to revolt against his father. He was killed during the attack on the royal bedchamber (29.6–7).

Of course, these biographies must be read for what they are: family sagas constructed on a series of royal-hero motifs (in particular dealing with the hunt) designed to praise the greatness of the hero. For instance, Megabyzus's return home, where he was barely recognized by his wife Amytis (Ctesias §41), is reminiscent of a familiar theme, manifested especially in Ulysses' return to Ithaca. We must thus not put good money on all of the information transmitted by Ctesias and Nepos: many episodes that at face value seem factual need to be rewritten. These stories nonetheless point to characteristics of the relationships between the king and the aristocrats. It seems clear that Plutarch's judgments on Tiribazus come directly from the court writers, doubtless Ctesias or Dinon. As such, they express perfectly the qualities and attitudes that characterized faithful servants devoted to the interests of the king. We find nearly the same words in Herodotus's evaluations of Mardonius: he was ambitious (VII.6), boastful (VII.9), a flatterer (VII.9; VIII.97, 100), violent and headstrong (IX.37, 61), quickly exalted by his success (IX.49, 58), clearly lacking in judgment. Numerous other examples of favor/disfavor could be cited. Nothing and no one escaped the king's judgment, not even the people most honored, including a son-in-law of the king (Ctesias §41) or a rebellious heir, such as Artaxerxes II's son (Plutarch, *Art.* 29). In short, for the king's men, the Tarpeian Rock was near the Capitol. From many examples, let us cite the example of Orontes, who was guilty of falsely accusing Tiribazus: "Artaxerxes excluded him from the company of his Friends and showered him with indignity" (*atimia*; Diodorus XV.11.2).

The fictionalized biographies just presented were also intended to illustrate the perennial theme of the king's ingratitude. It appears in this aphorism assigned by Plutarch to the same fellow:

Orontes, the son-in-law of King Artaxerxes, became involved in disgrace because of an accusation, and, when the decision was given against him, he said that, as mathematicians' fin-

gers are able to represent tens of thousands at one time, and at another time only units, so it was the same with the friends of kings: at one time they are omnipotent and at another time almost impotent. (Mor. 174b◊)

An entirely different image was the hallmark of royal propaganda, as can be seen from the tales bearing on Tiribazus. If he suffered the fate he did, it was because he did not show moderation and restraint. We can add to the record an anecdote recorded by Aelian (VH VI.14◊):

I learn of this very kind act of Darius the son of Hystaspes. Aribazus the Hyrcanian plotted against him in alliance with other Persians of note (*ouk aphanoi*). The plot was timed for a hunt. Darius learned of it in advance, but was not deterred; he ordered the men to make ready their equipment and horses and instructed them to hold their weapons at the ready. Looking at them severely he said: "Why don't you do what you set out to do?" Seeing his unflinching gaze they abandoned their plan; fear gripped them to such an extent that they dropped their spears, jumped off their horses and knelt before Darius, surrendering unconditionally. He despatched them in various directions, sending some to the Indian frontier, others to the Scythian. They remained loyal (*pistoi*) to him, remembering his kindness (*euergesia*).

We have no other details about this apparently isolated event. While the text indicates the existence of a plot, we do not know the protagonists or their objectives or motivations. It seems clear that the plot itself was revealed to the king who, because he was surrounded by his guards (which Aelian neglects to mention), was able to exhibit courage tinged even with a certain nonchalance!

At any rate, the text contains little of interest in the way of narrative history. Its primary purpose is an unambiguous ideological message. In fact, it clearly belongs to a very specific genre—royal propaganda or, if you prefer, court literature. It is built on a series of *motifs* linked with monarchic ideology: its intention is to picture Darius as a king who was courageous and just but implacable. The motif of the royal hunt is also interesting, because it is so repetitive. Even one of the versions of the execution of Smerdis/Bardiya claims that Prexaspes (entrusted with the mission by Cambyses) carried out the deed after "he took his victim out hunting" (Herodotus III.30◊). We may also note that the end of the story strangely resembles the denouement of Polyaeus's tale concerning the accession of Darius, who was aided by his stableman's ruse: "The satraps immediately set foot on the ground, performed the *proskynesis*, and made him king of the Persians" (VII.10 [= Herodotus III.85]). As it is transmitted to Aelian, the purpose of the anecdote was to hail the greatness and mercy of the king, not to highlight his weakness and isolation. Moreover, the conclusion is quite moral in itself (in the monarchic sense of the word); thanks to his *euergesia*, the king welcomed the nobles into the circle of his *pistoi*. And, despite being severely punished, the conspirators sing the praises of a sovereign whose greatness they immediately recognize by performing before him the rite of *proskynesis*!

The totality of the evidence thus tends to characterize the individual destiny of the king's men as being closely tied to the sovereign's favor. It is valuable in reminding us that those who held posts and positions were not civil servants in our sense. The only promotions within the system were granted as a result of merit recognized by the king, which was itself defined in relation to the criterion of devotion (*eunoia*).

3. The King and His Faithful: The Rationale of the System

The Faithful and bandaka

We can now return to the central question: the relationship between the aristocratic clans and the dynasty. The political effect of the royal *polydōria* was to constrain the behavior of the aristocrats so that they would act only in the king's interest. The designation of a person as a noble cannot be reduced to his family connections, however prestigious they may have been. It was also defined by the qualities that made a subordinate effective and faithful: "Mardonius, a Mede by birth, satrap and son-in-law of the king, [was also] among the first of all the Persians in deeds of arms and wise counsel" (Nepos, *Paus.* 1.2♠; cf. Diodorus XI.1.3). In Diodorus we find nearly the same words describing Tiriabazus: "In wars also, men say, he excelled in valour, and in council his judgement was so good that when the King followed his advice he never made a mistake" (XV.10.3♠).

All of the characteristics attributed to the king's men are wrapped up in a single word: 'faithfulness' (*pistis*). This is the virtue for which Cambyses honored Prexaspes, since he was "the most trusted (*pistotatos*) of his Persian friends" (Herodotus III.30♠). Likewise Artapates, who was "the one among Cyrus' chamberlains who was his most faithful (*pistotatos*) follower" (Xenophon, *Anab.* I.8.28♠). Cyrus the Younger, to be sure, "knew how to judge those who were faithful (*pistoi*), devoted (*eunoi*), and constant (*bebaioi*)" (I.9.30♠). It was also according to their faithfulness (*pistotatoi*) that Xenophon's Cyrus arranged his men around him in camp (*Cyropaedia* VIII.5.8). In his letter to Artaxerxes II, Orontas reminded him of the constancy of his "friendship and fidelity (*philia kai pistis*)" (Xenophon, *Anab.* I.6.3♠). One of the virtues required for becoming a Kinsman of the king was also faithfulness (Diodorus XVII.59.1). We find the word in Aelian: the nobles swore to remain faithful (*pistoi*) to Darius (VH VI.14). *Pistoi* is also the term used by Xenophon for the men the king ordered to inspect the provinces (*Oec.* IV.6) and by Aeschylus to describe the generals and governors (*Persians* 2). It is clearly for this reason that a man like Boges received from Xerxes "the highest praise" and that his descendants continued to receive honors from the king regularly: "When he was besieged by the Athenians under Cimon, son of Miltiades, and the chance was offered him of leaving the town [of Eion] on terms and returning to Asia, he refused to do so, because he was afraid the king might think that he had shirked his duty to save his skin; so rather than surrender, he held out to the last extremity" before ending his own life (Herodotus VII.107♠). The same was true of Mascames, governor of Doriscus, who alone succeeded in holding out against the Greeks: "Xerxes used to send him a special present every year in recognition of his superiority to all the governors. . . . This is the reason for the annual present from the Persian king" (VII.106♠). The two governors actually proved their faithfulness in every test, comparable to the faithfulness demonstrated later in Alexander's presence by the defenders of Celaenae (Quintus Curtius III.1.7: *pro fide morituros*), by Batis at Gaza (IV.6.7: *fides*), and by Maclates in Uxiana (V.3.4: *pro fide*).

It is generally believed that the Classical vocabulary (*pistis/fides*) renders a Persian concept. We know that at Behistun Darius uses the word *bandaka* to describe both subject and loyal peoples and those who supplied aid against rebels. The Persian word itself is hard to translate. In fact, the Akkadian version uses a word (*qallu*) that comes from the vocabulary of slavery or dependence. If, as is generally thought, the Greek translator of Darius's letter to Gadatas encountered the word *bandaka* in the original, he was unable

to find any equivalent but *doulos* 'slave'. The Behistun inscription and the translations/adaptations indicate at least that a *bandaka* was a person simultaneously subject and loyal to the king. The word *pistos* is probably not far removed.

The most concrete example is the relationship between Cyrus the Younger and Orontas, commander of the citadel at Sardis. We know that Orontas was a highly exalted individual because of the way he is presented by Xenophon: "A Persian, who was related to the King by birth" (*Anab.* I.6.1♠). Guilty of betrayal to Artaxerxes II, he was tried and condemned by the tribunal called by Cyrus. During the trial, Cyrus recalled:

This man was given me at first by my father [Darius II], to be my subject (*edōken hypēkoon eimai*); then, at the bidding . . . of my brother [Artaxerxes II], this man levied war upon me, holding the citadel of Sardis. (I.6.6♠)

Cyrus's expression illustrates quite clearly the nature of the relationship that was supposed to exist between a *bandaka* and his superior. This is also evident in another passage from Xenophon (*Hell.* IV.1.36: *hypēkooi*). When Darius was "giving" Orontas to Cyrus, he loosed Orontas from the ties binding him to Darius and transferred his allegiance to the person of his son Cyrus. In other words, Orontas was thenceforth obligated to be dutifully loyal to Cyrus without reservation. This became the basis of the later accusation leveled against Orontas. Perhaps the same sort of hierarchical relationship is suggested by Pharnabazus's desire to take a daughter of Spithridates without the formality of marriage (*aneu gamou*; Xenophon, *Ages.* 3.3), relying on the latter's obligation of loyalty.

Xenophon's text includes other interesting details. The initial reconciliation between Cyrus and Orontas is presented as follows: "Did you not again give me pledges (*pista*) and receive pledges from me?" (I.6.7♠). This makes it appear as though the recognition of a *bandaka* was made official in an official ceremony, during which Orontas gave his right hand to Cyrus, who gave him his (I.6.6). This custom, accompanied by oaths, is well known. It had the status of a guarantee, including, when it involved the king, a guarantee in regard to an individual or a foreign state (II.4.7; II.5.3; cf. Ctesias §§8, 30). "That is, among the Persians, the sign of an inviolable pledge (*pistis behaiotatē para tois Persais*)," Diodorus remarks (XVI.43.4). A passage in Nepos implies that, in a case in which one party was physically absent, he could send an object to represent his hand. Artaxerxes II "would give him a pledge (*fides*) to that effect in the Persian fashion with his right hand. When [Mithradates] had received that pledge from the king's messenger (*missam*)" (*Dat.* 10.1–2♠). This exchange signifies on the part of the *bandaka* a commitment of loyalty and, on the part of the superior, proof of no less total trust and doubtless also a promise to protect and honor his *bandaka*. At the conclusion of the trial and the conversation, "at the bidding of Cyrus, every man of them arose, . . . and took Orontas by the girdle, as a sign that he was condemned to death" (I.6.10♠). In the same way, when Darius III was angered by Charidemus, he "seized [him] by the girdle according to the custom of the Persians, turned him over to the attendants, and ordered him put to death" (Diodorus XVII.30.4♠). For many Iranian peoples, the girdle symbolized the tie between the superior and his *bandaka*: to grasp the girdle signified that the bond was broken.

This concept had very important implications for the political order. It tended to downplay family solidarity in favor of dynastic loyalty and to isolate the nobles in the one-to-one relationship that connected them to the king. Xenophon despairs about this in his picture of "Persian decadence." There he (fictitiously) sets up a before-and-after

scenario: "in the olden times," anyone who "effected anything else of good (*kalos*) or glory (*agathos*) for him, such an one received honour and preferment (*timōmenoi*); "now . . . if any one seems to bring some advantage to the king by evil-doing, . . . such are the ones who now have the highest honours (*hai megistai timai*) heaped upon them" (Cyr. VIII.8.4♦). By way of example, he denounces Mithradates, who without hesitation betrayed his father Ariobarzanes. Furthermore, there are other examples of Persians who, placed in a dilemma of having to choose between allegiance to family and allegiance to the crown, opted to serve the king (e.g., Nepos, *Dat.* 7.1; Diodorus XV.91.3). It was the same for plotters bound to each other by an oath: the attractiveness of royal favor itself eroded the solidity of their plots from within (cf. Herodotus III.71; Ctesias §30; Diodorus XV.91.1). Thus, Xenophon states that at the trial of Orontas even his relatives (*syggeneis*) grasped his girdle (I.6.10).

Clan Nobility and Court Nobility

In a passage devoted to the need for a strict governmental hierarchy, Xenophon presents the famous Chrysantas, who gives a speech before the *homotimēs* ['chief nobles'] and notables gathered by Cyrus (Cyr. VII.5.71). Extolling the virtue of obedience, he gave them the following speech: "Let us, therefore, present ourselves before our ruler's headquarters (*archeion*) yonder, as Cyrus bids; . . . Let us offer ourselves for whatever service Cyrus may need us for" (VIII.1.5♦). Chrysantas's proposals were greeted with approval:

They passed a resolution that the nobles (*entimoi*) should always be in attendance at court and be in readiness for whatever service Cyrus wished until he dismissed them. And as they then resolved, so even unto this day those who are the subjects of the great king in Asia continue to do—they are constantly in attendance at the court of their princes. . . . Accordingly, the nobles came to Cyrus's court with their horses and their spears, for so it had been decreed by the best of those (*hoi aristoi*) who with him had made the conquest of the kingdom. (VIII.1.6, 8♦)

Actually, elsewhere Xenophon recalls one of the obligations that the king laid on the satraps in these words: "To require as many as received lands and palaces to attend at the satrap's court and exercising proper self-restraint to put themselves at his disposal in whatever he demanded" (VIII.6.10♦).

Xenophon makes it quite clear that this was not a choice but a strict obligation. "If any of those who were able to live by the labour of others failed to attend at court, he made inquiry after them" (VIII.1.16♦, 20). Those who did not defer to this command were severely punished by having their goods confiscated and awarded to devoted, obedient nobles (VIII.1.17–21). This is the context in which the obligation laid on Persian nobles to attend the royal table, at least during meals, must be understood (Athenaeus IV.145f–146a). Xenophon makes the significance of these arrangements clear. They existed so that the king could hold up monarchic virtues and greatness in the sight of all. The most devoted nobles of the court received public honors, such as accompanying the king on the hunt: "And thus he inspired in all an earnest ambition, each striving to appear as deserving as he could in the eyes of Cyrus" (VIII.1.39♦).

The process Xenophon describes is nothing more or less than the development of a hereditary nobility into a court nobility. These court nobles were those whom the Greek authors call "People of the Gate" (e.g., Plutarch, *Them.* 26.6), who are incorporated into

the court hierarchy, discussed above. It is they whom Themistocles, for example, encountered at the court of Artaxerxes: the chiliarchs Artabanus and Roxanes (27.2–7), the king's cousin Mithropastes (29.7), the Friends of the king (29.5), the powerful personalities (*dynatoi*; 29.5), in short all the People of the Gate (29.1). It is they, depicted in rows on the walls of Persepolis (fig. 25, p. 221), who are so called by the author of the *De Mundo* 398a♦: “The chief and most distinguished men (*hoi prōtoi kai dokimōtatoi*) had their appointed place, some being the king's (*hoi men amph'auton ton basileon*) body-guard and attendants (*doryphoroi te kai therapontes*), others the guardians of each of the enclosing walls.” Each of them received an office and a particular assignment, and, according to this author, they could all be considered ‘slaves of the Great King’ (*douloi tou megalou basileou*)—in other words, court nobles, *bandaka*.

This kind of organization further increased the nobles' dependence on the king. Watched so closely (Cyr. VIII.1.22), the aristocrats had to conform to the dynastic ethic. In the event of revolt, these People of the Gate could also play an important role, as was the case after the battle of Cunaxa:

During this time Ariacus' brothers and other relatives (*anagkaioi*) came to him and certain Persians came to his followers, and they kept encouraging them and bringing pledges to some of them from the King that the King would bear them no ill-will because of their campaign with Cyrus against him or because of anything else in the past. (Xenophon, *Anab.* II.4.1♦)

During Megabyzus's revolt in the time of Artaxerxes I, he had with him two of his sons, Zopyrus and Artyphius (Ctesias §37). However, his wife and his youngest son, Artaxares, remained at court (§39). Although Ctesias does not clarify this point, it is apparent that, before signing a treaty with the king (cf. §39), Megabyzus insisted on the return of his wife and son: it was his wife and son (and other people sent by the king) “who convinced him, not without difficulty, to appear before the king.” In a way, the relatives of the satraps, who were called “the People of the Gate,” served as hostages to ensure the satraps' faithfulness. In this connection, we may quote the case of Memnon, who had retired to Halicarnassus:

Memnon sent his wife and children to Darius, because he calculated that leaving them in the king's care was a good way to ensure their safety, while at the same time the king, now that he had good hostages, would be more willing to entrust Memnon with the supreme command. And so it turned out. (Diodorus XVII.23.5)

As a further example, note that, before he left Sardis, Cyrus the Younger remembered to hold hostage at Tralles the wives and children of the commanders of the Greek mercenaries (Xenophon, *Anab.* I.4.8).

Education and Ideological Integration

On numerous occasions, Xenophon stresses the importance of education to the Persians. As he notes several times, participation in education was in principle open to all Persians. But he also states that “all the Persians may send their children to the common schools of justice. Still, only those do send them who are in a position to maintain their children without work; and those who are not so situated do not” (Cyr. I.2.15♦). In reality, however, the only ones with access were children of the *homotimēs*, a word used frequently by Xenophon to describe those of upper rank, in contrast to the simple peasants who had to work for a living. In other words, only the aristocratic families could send

their children to be educated. The same author says so quite clearly elsewhere: "All the sons of the noblest (*aristoi*) Persians are educated at the King's court" (*Anab.* I.9.3♦), and "it is still the custom for the boys to be educated at court" (*Cyr.* VIII.8.13♦). It was the same in the provinces: the satrap's men had "to have the boys that would be born to them educated at the local court, just as was done at the royal court" (*Cyr.* VIII.6.10♦). It is clear that those who shirked the obligation of being educated found themselves deprived of any chance to ascend to positions and honors, as was true for those who were unable to follow the required courses (I.2.15). This was thus an official system of education, whose successful administration was entrusted to educators (I.2.5) chosen from "their wisest men" (Strabo XV.3.18♦).

The opening chapters of Xenophon's *Cyropaedia* (I.3–5.5) explain the different stages of the education of the young Cyrus at Astyages' court (the book's title means 'Cyrus's education'), from childhood to the time when he was first admitted to the ranks of men and then first took command of an army. This education corresponds very closely to what was prescribed "by the laws of the Persians" (I.2.2). Xenophon indicates that the young Persians passed through several classifications according to age: children (*paides*) until 16 or 17; youths (*ephēboi*) for 10 more years; grown men (*andres*); and then, after 25 years of service, old men.

It is rather difficult to separate what is truly Persian in the *Cyropaedia* from Xenophon's implicit but significant transposition from Spartan institutions, which he has described in another work. The relationship between the two educational systems was also stressed by Arrian (V.4.5), who was a fervent reader and admirer of Xenophon. Fortunately, we can compare Xenophon with Herodotus and Strabo, even though various contradictions remain among the ancient authors about the division into age classes and about the courses taught at the different levels. According to Herodotus, the training of young Persians lasted from the ages of 5 to 20 (I.136); 20 was the minimum age for military service (I.209). According to Strabo, education occupied the youngsters from 5 to 24, with Persians serving in the army from 20 to 50 (XV.3.18–19). According to Herodotus (I.136♦), the Persians taught their children "three things only: to ride, to use the bow, and to speak the truth." Strabo adds: "to throw the javelin" (XV.3.18♦; cf. *Cyr.* I.2.8 and 12). Here is Strabo's view of the training regimen for which they were summoned by brass instruments each morning before dawn:

They divide the boys into companies of fifty, appoint one of the sons of the king or of a satrap as leader of each company, and order them to follow their leader in a race, having marked off a distance of thirty or forty stadia [5.5–7.4 km]. They require them also to give an account of each lesson, at the same time training them in loud speaking and in breathing, and in the use of their lungs, and also training them to endure heat and cold and rains, and to cross torrential streams in such a way as to keep both armour and clothing dry, and also to tend flocks and live outdoors all night and eat wild fruits, such as pistachio nuts (*terminthos*), acorns, and wild pears. These are called Cardaces, since they live on thievery (*klopeia*), for "carda" means the manly and warlike spirit. Their daily food after their gymnastic exercises consists of bread, barley-cake, cardamum, grains of salt, and roasted or boiled meat; but their drink is water. They hunt by throwing spears from horseback, and with bows and slings; and late in the afternoon they are trained in the planting of trees and in the cutting and gathering of roots and in making weapons and in the art of making linen cloths and hunters' nets. The boys do not touch the meat of wild animals, though it is the custom to bring them home. Prizes are offered by the king for victory in running and in the four other contests of the pentathlon. (XV.3.18♦)

This passage of Strabo is much more detailed than any other author's. It also poses a problem of interpretation. Without realizing it, Strabo [and/or an interpolator] in fact distinguishes two diets (wild fruit/daily menu). The former applied to boys called *kardakes*. They were the ones (exclusively, it seems) who stayed out all night, surviving on foraging and theft. In ordinary times, in fact, the children came home every day (Cyr. I.2.8), and the young people slept in a dormitory (I.2.9), except for the married ones (I.2.4). Far from living on the spoils of their thievery, the boys learned justice and honesty (I.2.6), and the youths were used "for seeking out malefactors, and chasing brigands" (*lēstai*; I.2.12).

Whatever the exact meaning of their designation, the *kardakes* were thus clearly a phase, a temporary stage, in the education by age-groups. The similarities with the Lacedaemonian *kryptie* are obvious. There we see a court rite of passage during which the youths had to prove their abilities in conditions exactly opposite to those of a soldier: living by night, solitary, surviving on foraging and plunder. After this test, they were admitted to the older age-group. Thus, this must have been a test imposed on those who had undergone ten years of training as youths (cf. Cyr. I.2.12). Other rites of passage, far more venerable, are known in Iran, particularly among the Carmanians (Strabo XV.2.14). This process must therefore represent an ancient Persian tribal custom, which was incorporated into the royal education received by the aristocratic youth.

Though it is not included in Herodotus, a certain amount of the information given by Strabo is also found in Xenophon. This includes the importance of the hunt in education, a recurrent theme in the *Cyropaedia* and many other of Xenophon's works. Every time the king goes hunting, some of the youths accompany him, for "in their eyes this occupation is the most authentic training for war. . . . It is difficult to find in war a situation that has not occurred on the hunt. . . . [During hunts] they eat nothing but cress, bread, and water," unless they catch game, which they may then eat (I.2.10; cf. I.2.8). Xenophon also states that they learn "the properties of the products of the earth, so as to avail themselves of the useful ones and keep away from those that were harmful" (VIII.8.14♦).

Training was thus principally physical and military, suitable for turning out good horsemen, good archers, and good lancers. Strabo is the only one to add that the youths were equally devoted to watching over the herds and planting trees. It is impossible to avoid comparing this with one of the royal virtues, the "good gardener" (chap. 6/5). By including agricultural training, young Persians were shaped to the royal model. The equivalence between the aristocratic ethic and the royal ethic could be achieved all the more easily because the royal is derived from the aristocratic. But despite the fact that they share the same values, the king and the aristocrats were not on an equal footing. Though the king was also a fine horseman, a fine archer, and a fine lancer, he was distinguished by superior virtues granted to him by Ahura-Mazda (chap. 6/2, 6/4). It is also significant that the honorary distinctions were awarded to the best youths by the king himself. While the rite of passage just described marked entry into the class of adult warriors (*andres*), the public ceremony of awarding prizes allowed the youths to join those whom the king considered the Faithful (*bandaka*) on an equal footing. Educated at the Gate, "they see and hear the names of those whom the king honors, as well as those who incur his disfavor" (Xenophon, *Anab.* I.9.4).

Now what was the significance of the third instruction the young Persians received: 'To speak the truth' (*alēthizesthai/alētheuein*)? Herodotus himself probably did not know. Xenophon tells us that the children "spent their time learning justice" (*dikaiosunē*),

gratitude, and temperance (Cyr. I.2.6–8); “they were present at trials conducted according to the law” (VIII.8.13). It is tempting to suppose that the Greek words for truth/justice corresponded to the Persian word *arta*. Based on this assumption, what we hear Herodotus and Xenophon saying is that the youths were educated in the duty of dynastic loyalty. Strabo provides an essential detail: the educators “also interweave their teachings with the mythical element (*mythōdes*), thus reducing that element to a useful purpose, and rehearse both with song and without song the deeds (*erga*) both of the gods and of the noblest men” (*aristoi*; XV.3.18♦). Xenophon adds an extra item, speaking “of tales and songs still heard today. . . . In them, Cyrus is [presented as] having received from nature a very beautiful figure, a very generous soul, a passion for study and for glory to the point of enduring any fatigue, to face all dangers to earn glory” (Cyr. I.2.1).

It thus appears that the educators were entrusted with transmitting to the young Persians the oral traditions of their people. These dealt with the heroes as much as with the gods. As Xenophon says, a good part of the traditions dealt with the founder-heroes of Persian grandeur, such as Cyrus (cf. Herodotus III.160). A passage from Athenaeus is most relevant. Within a long digression on the place of music, dance, and hymns in education (XIV.630–31e), Athenaeus recalls that “in days of old,” music played a central role (631e–32), especially among the Spartans. More generally, “in days of old . . . it was the acts of heroes and the glory of the gods that the poets set to music” (*di'oidēs*; 633c). Then, quoting Dinon's *Persica*, he states that this custom has been maintained among the barbarians: “It was the singers (*ōidoi*) who, for example, exalted the courage of Cyrus the Elder and the war he conducted against Astyages.” Dinon in fact records that when Cyrus had taken the Persian road that would lead to the founding of the Empire (he was then the head *rhabdophore* [‘rod-bearer’] at the Median court), Astyages held a great feast to which Angares, the most renowned singer of the time, was invited. Angares told a story of a powerful beast, lord of all the surrounding regions. In answer to Astyages' question, he replied that this beast was none other than Cyrus (633d–e). Through this passage from Dinon, we gain a specific detail about the oral transmission of founder legends. There is hardly any doubt that, beginning with Darius, the legend of Achaemenes raised by an eagle was added to it; royal propaganda presented this legend as explaining the origin of the nobility (*eugeneia*; Aelian, *Anim.* XIII.21).

There is no longer any doubt that the “wise men” entrusted with this mission were the *magi*, veritable depositories of the collective memory. They specialized in hymns and theogonies (Herodotus I.132; Strabo XV.3.14 [*epōidai*]; Xenophon, *Cyr.* VIII.1.23; Quintus Curtius III.3.9; V.1.22; Pausanias V.27.5–6). We also know that they were entrusted with the education of the royal children (p. 521). Their detailed knowledge of plants and remedies (pp. 266f.) suited them also to teach the value of herbs to Persian youths.

In sum, Persian youths learned throughout their training to become faithful servants of their king, as soldiers as well as subjects. The imperial hierarchy was implicitly present in this training, since the groups of fifty were led by a son of the king or a son of a satrap (XV.3.18). Here, the word *satrap* is taken in its generic sense of representative of the royal elite (cf., e.g., Polyaeus VII.10). Even though Xenophon states that the king's sons also participated in this education (*Anab.* I.9.1–2; *Cyr.* I.3.1), it is clear that, in this as in other ways, they enjoyed a special status.

4. The King and His Faithful: The Dynamic of the Contradictions

Birth and Royal Favor

The preceding discussions lead to a very simple question, which has been glossed over so far—or we have simply assumed the answer: what, exactly, is a noble? We have only the Classical sources to help define the structure and organization of this nobility. Nobles were defined by birth and wealth: “Otanes, the son of Pharnaspes, one of the wealthiest (*chremasi*) members (*genei*) of the Persian nobility (*ho prōtos tōn Perseōn*)” (Herodotus III.68); Orxines, in 325, is introduced by Quintus Curtius as follows: “Prominent among all the barbarians for high birth (*nobilitas*) and wealth (*divites*). He traced his descent from Cyrus, formerly king of the Persians” (X.1.22–23♦). Orxines is distinguished by his position as head of the tribe of the Pasargadae. An aristocrat’s status was thus defined by his ethnicity (*anēr Persēs*), his father’s name, or his tribe and/or clan’s name, as shown by the words used by Herodotus to identify the heads of the expedition against Cyrene around 513: “Amasis, a man of the Maraphii tribe, and Badres, of the Pasargadae” (Herodotus IV.167♦). Similarly, at Naqš-i Rostam, the inscription identifying Gobryas refers to the tribe of his origin (Patišuvariš) (DNe). And there are many references to people called Achaemenid (in the tribal sense) around Cambyses (Herodotus III.65), Darius, and Xerxes (V.32; VII.62; VII.117, etc.).

The nobility was also defined by contrast with the poor. In two of his inscriptions, Darius refers to certain antagonistic social groups: in his Naqš-i Rostam inscription (DNb), the king is presented as mediator between the ‘powerful’ (*tunavant*) and the ‘weak’ (*skauθi*), which can also be understood as rich and poor. He and the members of the “royal stock” are placed among those he calls *amata*, a word meaning ‘proven’, ‘excellent’, which is usually translated as ‘noble’. Another word, *azata*—not found in the royal inscriptions—also refers to nobility of origin, contrasted more generally with persons of inferior status.

The Greek authors make it very clear that “Persian” ethnicity refers to distinct social realities. For Herodotus (I.133) and Strabo (XV.3.19), the social distinction between the directors (*hēgemōnes*) and the people (*hoi polloi*) exists chiefly on the economic level. At birthday banquets, “the rich are served an ox, a horse, a camel, a donkey, all oven-roasted whole; the poor, sheep and goats.” One group has rich, colorful garments; the other, mediocre clothing. Joint participation in military expeditions does not efface these distinctions. In Xerxes’ army, Herodotus sets up an opposition within what he calls “the king’s men”: some twenty thousand horsemen “taken from all the Persians” versus the thousand pikemen who follow Ahura-Mazda’s chariot, “all men of the best (*aristoi*) and noblest (*gennaioῗtatoi*) Persian blood” (Herodotus VII.41♦). We may also mention Heracles’ description of the 1,000 Persian *melophoroi*: “They are chosen by their high birth (*aristidēn*) from the group of 10,000 Persians who bear the name Immortal” (Athenaeus XII.514c).

Within the aristocracy, subtle distinctions are made by the Greek authors using a vocabulary whose apparent diversity makes sociological interpretation difficult. The Persian nobles could be ‘esteemed’ (*dokimoi*), ‘noteworthy’ (*logimoi*), ‘honored’ (*en ainē*), ‘worthy’ (*axioi*), ‘renowned’ (*onomastoi*), ‘prestigious’ (*epiphaneis*), and so on. In reality, these words are often used interchangeably. More interesting are the gradations

expressed by the Classical authors with comparatives or superlatives. It is not enough, for instance, to be "esteemed"; one must be among "the most esteemed." Herodotus often describes this superior stratum of aristocracy as *prōtoi*, that is, 'first' or 'princes'. This is the small group the king convenes in peacetime or wartime (Herodotus I.206; III.127; III.65; VII.8; VII.53). The same gradations exist when the king is not present in the theater of operations. In Otanes' army at Samos, Herodotus singles out "the Persians of the highest rank (*tōn Persēōn hoi pleistou axioi*) [who] then had chairs of state placed for them" (III.144♦). After Xerxes left for Sardis, Mardonius was put in command of the army. A rich Theban held a banquet and "invited Mardonius and fifty other distinguished (*hoi logimōtatoi*) Persians" (Herodotus IX.15♦) who, "after Mardonius, were the most honored (*hoi met'ekainou en ainē eontes*)" (IX.16).

At first sight, this multifarious vocabulary seems to reflect an obvious fact—a genetic reality: one was a noble because one was the son of a noble. But at the same time, the court hierarchy, based on royal favor, necessarily rivaled the clan hierarchies, which derived solely from the privilege of birth. To be distinguished as a noble was not simply a matter of family lineage. Herodotus's vocabulary expresses this double designation. Masištius, lost in the battle of Plataea, is described by Herodotus thus: "a man more highly thought of (*logimōtatos*) both by the king and by his subjects (*kai basilei*) than anyone else in the Persian army except Mardonius himself" (IX.24♦). Herodotus uses comparable expressions several times: the Achaemenid Artachaees was "much respected by Xerxes (*dokimos . . . para Xerxēi*)" (VII.117♦). Prexaspes is not just "in very high honor among the Persians (*en ainē megistē . . . en Persēi*)" and "a distinguished man" (*dokimos*) but also, "the most trusted of [Cambyses'] Persian friends" (III.30♦). We may also quote Artabazus, son of Pharnaces, "who was already an famous man in the Persian army (*en Persēisi logimos*) and was further to increase his reputation as a result of the battle of Plataea" (VIII.126). Even before Plataea, he was already "a Persian of the very highest reputation with Xerxes (*anēr dokimos para Xerxēi*)" (IX.41).

In some way, the two expressions used by Herodotus (more highly thought of than anyone else in the Persian army/of the very highest reputation with the king) refer to the two hierarchies, which continued to coexist: the clan hierarchy (birth) and the royal hierarchy (favor/gift). In other words, royal favor relativized the prestige connected with birth. As Aelian puts it (*Anim.* XII.21), the Persian aristocracy of birth (*tōn Persōn eugeneia*) was defined by reference to dynastic norms. It is also quite characteristic that the grammarian Hesychius explains the Persian word *azatai* 'free, noble' as follows: "Those who are closest to the king." Being held in the king's great esteem was one of the criteria for nobility; moreover, used in the superlative (*eggytatoi*), the word implied the idea of (fictional) relatedness.

Royal Favor and Social Mobility

That there were ways of joining the royal hierarchy apart from being born into it leads us to suppose that it was theoretically possible for a particularly deserving, poor Persian to become integrated into the royal hierarchy. Within Cyrus's army and entourage, Xenophon several times distinguishes the *homotimēs* from the people (*dēmotoi*): the former could live without working, because "they live on the labor of others" (*Cyr.* VIII.1.16); the latter, however, "have to earn their living" (II.1.1). These are the common peasants, whom Xenophon (VII.5.67) and Aelian (VH I.32) call the *autourgoi*, that is (by Greek

standards), small landowners. For the *homotimēs*: war; for the peasants: farmwork (IV.3.12–13).

Xenophon refers to societal promotions. The people whom Cyrus called on first for his private guard were the *autourgoi* (VII.5.67). And, in a discussion of promotion regarding individual merit, Xenophon introduces the Persian Pheraulas (II.3.7♦). He was one of the people (*dēmotoi*) “but a man who for some reason or other had from the beginning won Cyrus’s confidence and affection; besides, he was well-favoured in body and a gentleman at heart.” But because of his origin he did not have access to the traditional education of the Persian nobles. His father was a poor peasant who had to borrow his seed grain (VIII.3.36–38). Although Pheraulas had no choice but to work the land with his father, he was fascinated with the profession of soldiery from childhood (II.3.9–12). Addressing the *homotimēs*, he offered himself as an example and stated that “we are all now starting on an equal footing in a contest of merit” (II.3.8♦). He added: “Cyrus . . . I, for one, shall not only enter this contest, but I shall also expect you to reward me according to my deserts,” challenging the other *dēmotoi* of the army to follow his example and “enter with alacrity into the competition with these gentlemen in this sort of warfare” (II.3.15♦). The conclusion was that each would “receive rewards according to his deserts, and that Cyrus should be the judge” (II.3.16♦).

It is difficult simply to take Xenophon’s presentation at face value. He has composed a highly political discourse on the merits of a society based on the worth of the individual. At the same time, he seems to promote one of the themes specific to the monarchic ideology. The Achaemenid king, as we have seen at Behistun and Naqš-e Rostam, positioned himself as the conciliator of the interests of the powerful (*tunavant*) and the weak (*skauṭi*). Simple soldiers or common peasants could be promoted suddenly to the rank of royal Benefactor and receive royal gifts (Aelian, VH I.32; XII.40). But there are no specific examples that might confirm the “society tale” of Pheraulas. Nonetheless, we may cite the example of the poor Mardian peasant Rhakokes, who as a reward for his justice was elevated by the king to the position of royal judge (VH I.34). At the same time, it is true that Aelian’s anecdote itself emerged from court circles.

Let us also remark that in some of the Persepolis tablets, some Persians are identified not by their tribe name but by their place of residence: Iršena of Anšan (PF 1368), Umizza “son of Halpa, who lives in Hiran” (PF 2070), Uštana of Shiraz (PF 1811), Šadukka of Zappi (PF 1790), Ukama of Paišiyawādā (PF 330, 2027), and many more. The coexistence of tribal denotations (PF 1797; cf. Herodotus IV.167) and local denotations could well be an indication of a change-in-progress of prosopographic practice. It might also indicate a social differentiation between the old aristocratic families that were attached to their tribes and Persians of lower birth called into service by the king. In fact, the two interpretations harmonize perfectly: the “new social class” represented by the latter would consist of men who rejected the confines of the tribe; the old-stock aristocrats, however, continued to value belonging to a famous tribe until the end of the Achaemenid era. More will be clear when the ethnonyms that appear here and there are better understood. In one tablet, for example, the administration distributes rations to Maraphii and Kušiyans (PF 447). We do not know who the Kušiyans were. On the other hand, according to Herodotus (I.125) the Maraphii were a Persian tribe. It is thus not impossible that they were Persian peasants, whom we do not know whether to distinguish from or compare with the “*kurtas* living off rations at Marappiyaš” (PF 909–11). Prudence on this

score is thus advised. The Persepolis tablets still hold many secrets. The interpretation is all the more insecure because we do not know the exact social origins of many of the Persians of the royal entourage named by the Classical authors.

Furthermore, if such promotions could take place, they did not seriously affect Persian social structures. Two tablets (PF 871, 1137) record the provision of rations to 29 and 15 "Persian boys (*puhu*) [who] copy texts . . . at Pittaman." The word *puhu* always refers to a category of *kurtas̄* who received less rations than men. Otherwise, nothing distinguishes these tablets from hundreds of others of the same type. We must thus recognize that some Persians were reduced to the status of *kurtas̄* under circumstances we do not understand (impoverishment? royal punishment?). And it is likely that these tablets are only a sample. It is reasonable to imagine that quite a few Persian *kurtas̄* are listed anonymously in the tablets. It also seems fairly logical to think that simple Persians worked the lands of aristocrats. They were doubtless also required, as *corvée* labor, to work the lands in the paradises near their village or to maintain the roads for the passage of the Great King and his court (cf. Aelian, *Anim.* XV.26). We also know that starting with the time of Cambyses, slaves bought at Matezziš had Persian names (see p. 88). The imperial triumph of the dominant ethnic group clearly did not wipe out class differences. The dominant socioethnic class held the preeminent position not just in the Empire but in Persian society itself.

All in all, even when we postulate the possibility of social promotions, there is no doubt that the greater part of the king's men came from the great aristocratic families. The privileges of birth never disappeared. The importance of birth as a criterion is well illuminated by later texts: when the Greeks, after Cunaxa, came to Ariaeus to ask him to take Cyrus's place, he replied as follows: "Many Persians nobler (*beltiones*) than him will not support his becoming king" (Xenophon, *Anab.* II.2.1). When the Spartan king Agesilaus mediated in arranging a marriage between the daughter of the Persian Spithridates and the Paphlagonian dynast Otys, what decided Otys was not the young lady's vaunted beauty but the nobility of her father's ancestry: Spithridates was "from a family inferior to none in Persia" (*Perseōn oudenos endeesteros*); he was "particularly well born (*eugenestatos*)" (*Hell.* VI.1.6–7). And, in Darius III's army, the Persians of distinction (*hoi entimoi Persai*) were distinguished by Arrian from 'the masses' (*to plēthos*; Arrian III.11.8). Alexander later used the same principle to differentiate some Persians who fell into his power after the death of Darius: "Having inquired into the rank (*nobilitas*) of each one, he separated from the common herd (*vulgus*) those who were of high birth (*genus*)" (Quintus Curtius VI.2.9♦).

Persian Aristocratic Houses

Herodotus (I.134) and Strabo (XV.3.20) further indicate that the social hierarchies in Persia cannot be reduced to the opposition rich/poor. Among the elements of social symbolism, in fact, they give special attention to the manner in which Persians greeted each other, according to their place in the social hierarchy. If they were notables (*gnōrimoi*) or 'equal in honor' (*isotimoi*), they kissed on the lips; if one of them was of lower status (*hypodeesteros*, *tapeinoteros*), they kissed on the cheeks; and lastly if one of them was of much lower birth (*pollōi agennesteros*, *eti tapeinoteros*), he was restricted to performing the *proskynesis* before his better. Taken at face value, these practices seem to follow three categories, which we might render, both conveniently and vaguely, with the

following expressions: the nobility [*grande noblesse*] (*isōtimoi*; cf. *homotimoi* in Xenophon), the gentry [*petite noblesse*], and the commoners [*gens du commun*].

The first group comprises the heads of the great aristocratic houses. This is the word (*oikos*) used by Herodotus for Intaphernes. He is reputed to have conspired "with all the men of his house" (*hoi oikeioi pantes*), including his sons (III.119). The internal cohesiveness of the great families is well evidenced in the wonderful aristocratic romance of Odis and Zariadres told by Chares of Mytilene and passed on by Athenaeus (XIII.575). The girl's father opposed the marriage because "lacking male issue, he wished to give his daughter to a young man of his own house" (*eis tōn peri auton oikeiōn*; 575c). It is clear that the aristocrats' power, in Persia as well as in the provinces, was based on possessing land. Perhaps estates of this sort are what underlie the events alluded to in two Treasury tablets (PT 4–5). The late example of Orxines also provides similar confirmation: he came to receive Alexander with great pomp when he arrived from Carmania. As the head of the tribe of the Pasargadae, Orxines represented himself as a descendant of Cyrus. Quintus Curtius includes this detail: "Prominent among all the barbarians for high birth and wealth. . . . He had wealth, both what he had inherited from his forefathers and what he himself had amassed during long possession of sovereignty" (X.1.22–23♣). The example of Orxines also shows that the tribal hierarchies were preserved. We may presume, though there is no definitive proof, that what we have called the nobility pertained to the three tribes (Pasargadae, Maraphii, Maspii) that, according to Herodotus, dominated all of the others. Of these tribes, the Pasargadae, whose members were particularly noble (*aristoi*), retained the preeminence (Herodotus I.125). Should we imagine a distinction between high nobility, which owned ancestral estates in Persia, and another nobility, which basically held its possessions by royal favor?

For the economic organization of the great aristocratic houses, the most revealing text is a passage by Heraclides quoted by Athenaeus. The abundance and variety of the dishes prepared for the king's table every day (IV.145a) were found at the tables of the wealthiest Persians: "A rich Persian (*eudaimones*) on his birthday will have an ox, or a horse, or a camel, or a donkey baked whole in the oven" (Herodotus I.133). While explaining the careful economic management of the food supply for the royal table, Heraclides remarks that it was the same for "the elite Persians" (*hoi en dynasteia*; Athenaeus IV.145e–f). He then explains (145f–146a):

The entire meal is brought to the table at one time. But when the Tablemates (*syndeipnoi*) have finished their meal, whatever remains on the table, basically meat and bread, is given by the officer in charge of the table to each of the people of the house (*oikeioi*). They take it and in that way receive their daily supplies. This is the reason the most honored Tablemates of the king (*hoi entimōtatoi tōn syndeipnōn*) come to court only for lunch (*ariston*), rather than twice: so that they are able to receive their own *syndeipnoi* ("Tablemates").

All of these statements are unambiguous. The aristocratic houses were directed and organized in a way absolutely identical to the rules that governed protocol in the royal house. Every house had its steward (Berossus apud Athenaeus XIV.639c), as did the royal house (Herodotus III.61). No doubt, these *syndeipnoi* of the great aristocrats were chosen from the men of the house (*oikeioi*) and perhaps also from nobles of a lower rank, who would have been part of their network of alliances and power. The analogy between the aristocratic houses and the royal house is even purer in that the banquets Herodotus describes (I.133♣) are given on the birthday of the head of the house, "of all days in the

year a Persian most distinguished his birthday and celebrated it with a dinner of special magnificence." It echoes the importance of the banquet given every year on the king's birthday (IX.110). It is thus not impossible that on that day as well, the heads of houses, like the king, gave gifts to their guests to symbolize and reinforce their power and influence. In sum, Persian society functioned according to a hierarchy that was at once highly diversified and extremely constrained: every great aristocrat also had his own *bandaka* who paid him homage in the form of *proskynesis* (cf. Xenophon, *Anab.* I.6.10).

The similarities do not stop here. Like the kings, the heads of houses practiced polygamy: "Every man has a number of wives, and a much greater number of concubines" (*pallakai*; Herodotus I.135). Strabo adds that polygamy had the objective of providing a large number of children (XV.3.17: *polyteknia*). Herodotus agrees (I.136): "After prowess in fighting, the chief proof of manliness is to be the father of a large family of boys." It is also practically certain that the aristocratic families, following the pattern of the royal family, could enter into endogamous unions. The practice is implicit in a story told by Ctesias: "Teritouchmes [Darius II's son-in-law] had a sister born to the same father and the same mother as he, Roxanne. . . . He became enamored of her and had relations with her" (§54; cf. Athenaeus V.220c).

Herodotus describes the authority that the head of the family had over his children as well:

They declare that no man has ever yet killed his father or mother; in the cases where this has apparently happened, they are quite certain that inquiry would reveal that the son was either a changeling or born out of wedlock, for they insist that it is most improbable that the actual parent should be killed by his child. (I.137)

The authority of the head of the family is even compared explicitly to the king's: "the custom . . . forbids even the king himself to put a man to death for a single offence, and [it forbids] any Persian under similar circumstances to punish a servant (*mēdeis tōn heautou oiketeōn*) by an irreparable injury" (I.137). In other words, the head of the house seems to have held the power of life and death over the people who depended on him—sons, relatives, and servants—at least for punishments relating to family custom. This may be how we should understand the relationship between Xerxes and Sataspes: presented as an Achaemenid by Herodotus, Sataspes was a close relative of the king, since his mother was Xerxes' sister. Before he was pardoned because of his mother's pleas, he was condemned to death by the king because "he had raped a daughter of Megabyzus' son, Zopyrus" (IV.43♦). Now, we know that Megabyzus himself had married one of Xerxes' daughters (Ctesias §22ff.). It was thus perhaps in his role as head of the royal House that Xerxes intervened in this case.

Family Solidarity and Royal Policy

We thus see that neither the tribal structures nor the privileges of birth ever disappeared. On the contrary, the solidarity of the great Persian houses gave their heads undeniable means of action, as much in the social and economic spheres as in the political. To a certain extent, they even appear to have contradicted the principle of unmitigated royal authority, in particular when they were involved in the process of transmission of imperial orders. By virtue of their riches (and their daughters), the nobles could also gather a clientele by turning the exchange of gifts/favors to their own advantage, which could not help but advance their personal ambitions. This was the "gravest" accusation brought against Tiribazus by Orontes: "To seek by his good deeds

to turn to his own cause the commanders of troops and to use honors, gifts, and promises to win them" (Diodorus XV.8.4). Such observations quite naturally specify and confirm the conclusions presented previously on the close dependence that bound the aristocracy to the dynasty by means of royal gifts and honors.

Herodotus and Strabo give some indications of Persian traditional practices regarding wedding ceremonies—for example, on the diet observed by the bridegroom (Strabo XV.3.17). More important, both quite clearly distinguish legitimate marriages from unofficial unions, in the same way that the Greek texts distinguish legitimate children from illegitimate (*nothoi*). It was for this reason that Spithridates was angry with Pharnabazus, who claimed to want his daughter without marriage (Xenophon, *Ages.* 3.3: *aneu gamou*). It is likely that marriages were arranged by heads of families and that the contract was solemnified by oaths and sacrifices (cf. Herodotus IX.108). In some cases, the direct intervention of the king is attested (Herodotus VI.41), not to mention the example of the king's daughters. But the question of what authority sanctioned the legitimacy of the marriage remains. To read Herodotus (III.31), it appears that royal judges could be consulted; however, their involvement, in this area as in others, was limited to "interpreting the ancestral laws." This is the context in which Cambyses approached them to learn whether he had the right to marry his sister.

Let us turn to Arrian, who describes the marriages organized by Alexander at Susa in this way:

They were celebrated in the Persian way (*nomōi tōi persikōi*); they arranged several rows of armchairs for the future spouses, and after they drank each other's health, each bride sat beside her intended; the men took them by the hand and kissed them, following the king's example. For all the weddings were celebrated at the same time. (VII.4.7)

Of course, this is a late text. But, at the same time, Arrian twice insists on the Persian character of the ceremony (cf. VII.6.2). Furthermore, the political nature of the marriages in Susa makes this interpretation very likely. Shall we infer from this that, in the Achaemenid period as well, all of the weddings were celebrated at the same time, in the presence of the king? On the first point, Strabo gives a positive answer: "Marriages are consummated at the beginning of the vernal equinox" (XV.3.17♦). It is thus not impossible that marriages were recognized by royal authority, or perhaps doubly solemnized—first within the tribe and then by the king in a public ceremony at court.

Herodotus also writes about large Persian families. He notes that, "after prowess in fighting, the chief proof of manliness (*andragathiē*) is to be the father of a large family of boys" (I.136). He immediately adds this detail: "Those who have the most sons receive an annual present (*dōra*) from the king." Strabo uses the word *athla* (XV.3.17), which suggests the idea of a competition between the great families in the same way that the king distributed rewards as prizes for competitions won during Persian youths' education (*athlon*: XV.3.17). As in the case of other gifts and favors, we must consider this occasion and the distribution of prizes to be a form of official recognition. In some fashion, then, a traditional family value was integrated into a demographic policy encouraged by the king. We can easily understand the reasons. To protect their military and political power in the Empire, the Persians had to maintain a large population on which the king could draw to provide his elite cavalry and to serve as a breeding ground for officers and administrators. At the same time, the youth of the aristocracy, called up to the king's service, were molded by the royal education.

On the other hand, the authority of the head of the family was not as absolute as Herodotus would have us think. First of all, several accounts make it clear that, even if youths lived with their father, they had to obey any call to return to the royal army. Twice Herodotus portrays fathers who tried to get a son exempted from military service. Each time, the king's reaction was extremely violent: he reminded them that he himself brought his sons with him (cf. Herodotus VIII.104, 107; Quintus Curtius III.8.12), and he put the young men to death (IV.84; VII.38–39; Seneca, *De ira* XIV.2.4). The principle of familial solidarity had its corollary in judicial order. During a revolt, rebels generally took all the members of their household with them. On the other hand, as already noted (see p. 325), the attractiveness of royal favor frequently led some to breach this solidarity. Nevertheless, this behavior—taking one's entire family along when rebelling—is easily explained by the principle of familial solidarity, for, when all was said and done, the entire family was considered guilty and therefore all would be executed, as the example of Intaphernes already mentioned shows so well (Herodotus III.119; cf. IX.113, and Plutarch, *Art.* 29.8). Under these conditions, we understand how Glus, son-in-law of Tiribazus, might have been afraid of being implicated in the charges levied against his father-in-law (Diodorus XV.9.3).

Finally, let us quote the inexhaustible Aelian:

A man called Rhacoces, of the Mardian tribe, had seven children. The youngest of them was called Cartomes, who did a great deal of harm to his elder brothers. At first his father tried to correct and restrain him by admonition. But when this failed, the local magistrates (*hoi dikastai tōn perikhourōn*) arrived at the house of the young man's father, and the latter arrested the lad, tying his hands behind his back and taking him into the presence of the magistrates. He made a full and detailed denunciation of all his acts of misbehaviour and asked the magistrates to execute the young man. They were horrified, and decided not to pass sentence on their own authority; instead they brought both before Artaxerxes, the king of Persia. When the Mardian repeated his statement, . . . Artaxerxes commended Rhacoces and made him one of the royal magistrates (*basilikoi dikastai*). (I.34↔)

This court anecdote illustrates quite well the relationship between family justice and royal justice that existed on this occasion. First, Rhacoces attempted to take care of the problem as head of the family; second, he appealed to the local judges, before being received by the king himself. Of course, this anecdote is late: no other document gives any idea of when these circuit judgeships were created (cf. chap. 11/10 [p. 483]: a judge of Pamaka). In addition, this anecdote does not portray an aristocrat; nonetheless, it very clearly poses the problem considered here.

5. King and Satraps

Family Strategies and Royal Control

Among all the Faithful of the king, the satraps ("Protectors of the power/kingdom") played an essential role in the Empire, and the powers and prestige with which they were endowed could have provoked them to keep their distance from the king. The solidarity of the great Persian families explains how, once a noble was named satrap, he could take his whole family along with him; it also explains how his sons could cooperate with his government or perhaps participate with him in a revolt against the king (e.g., Ctesias §§37–38, 40). Every head of family had the goal of promoting his children to the highest positions in the Empire (cf. esp. Diodorus XVI.52.3–4). Furthermore, the prac-

tice of passing on responsibilities to the next generation is frequently attested. Twice, Ctesias writes: "N became satrap in place of his father" (§§53, 57).

The best-known case concerns the satrapy of Hellenistic Phrygia. In 479, Xerxes appointed Artabazus (Thucydides I.129.1). He was a man of illustrious birth, the son of Pharnaces, who most likely was the same as Parnaka, economic minister of Persia under Darius. Pharnaces/Parnaka was in turn son of Arsames, who all agree was a brother of Hystaspes, father of Darius. Artabazus thus was closely related to the royal family, since he was the son of Darius's cousin. He took part in the expedition of 480 (Herodotus VII.66). He was Xerxes' escort upon the king's return to Sardis; by that time, he was "already a famous man (*dokimos*) in the Persian army" (Herodotus VIII.126). After a setback in Chalcis, he returned to place himself under Mardonius's command (VIII.126–30) but opposed his strategy (IX.66). After the defeat at Plataea, he succeeded, at some cost, in leading some companies of troops to Asia Minor (Herodotus IX.66; 89–90). This is when Xerxes granted him the satrapy of the Hellespont, in the context of his reorganization of his possessions in Asia Minor (see chap. 13/8 below). He played an important part in the 470s (Thucydides I.129.1) and was still on the job in 449 (Diodorus XII.3–4). At an unknown date, he was succeeded by his son Pharnaces, who according to the practice of papyponymy bore his grandfather's name. In 412, Pharnaces' son Pharnabazus controlled the satrapy, perhaps for a time jointly with his brothers, since the treaty with Sparta was signed in the name of Pharnaces' sons (Thucydides VIII.58.1). In 387–386, Pharnabazus was recalled to court, and he married Artaxerxes II's daughter Apame. We can follow the family's narrative down to the time of Darius III (and even beyond).

Familial legacy is also known as the basis for other positions. So it was that Otanes succeeded his father Sisamnes (condemned to death by Cambyses) as royal judge (Herodotus V.25). The measures taken by Mardontes and Artayntes, commanders of the fleet in Asia Minor in 479, were also characteristic: "the command was taken over (*autou proselomenou*) . . . together with one other — Ithamitres, Artayntes' nephew, who had been chosen for the position by his uncle" (VIII.130♠). Even if a well-known, esteemed noble's responsibilities were not automatically passed on to his sons, numerous examples show that they were automatically incorporated into the ruling class. One of Xerxes' admirals in 480 was Prexaspes (II), son of Aspathines (I) (Herodotus VII.97). This Aspathines I was probably none other than the person listed (erroneously) among the Seven by Herodotus (III.70, 78), and one of the royal arms-bearers at Naqš-e Rostam (DND). Despite the risk of misidentification (homonymy being no guarantee of identity), it is also tempting to identify him with the person of the same name mentioned in several Persepolis tablets from the time of Darius and Xerxes (PT 12–12a, 14); his seal names him: "Aspathines, son of Prexaspes." He was therefore the grandson of Prexaspes I, who held a choice position in Cambyses' entourage.

Given these practices, the danger of creating little satrapal principalities was great. Oroetes seems to have tried this in Asia Minor, profiting from the void at the center of power (see above, chap. 3/2). Sons naturally tended to behave like successors to a patrimonial estate, as illustrated by the remark placed in Pharnabazus's mouth by Xenophon, addressing these words to Agesilaus: "Everything my father left me, beautiful palaces and paradises full of trees and game, which so delighted me, all this I have seen razed and burned to the ground" (*Hell.* IV.1.33). A further detail (IV.1.40) seems to imply the existence of battles between the heirs apparent to the position of satrap. However, it

appears that the appointment or dismissal of satraps and generals was basically the prerogative of the king alone (cf. Herodotus VI.43). The insertion of a relative (son, nephew) into the chain of command by a father or an uncle with a position implies that there also was confirmation (or disallowal) by the king (Arrian II.1.3 and II.2.1). It is likely that the satraps' power was periodically confirmed (cf. Diodorus XI.71.2). Although satraps were closely watched, the principle of family inheritance of power had the advantage of preparing the sons to exercise the duties of satrap. It must be added that the length of the term of the Pharnacids of Hellespontine Phrygia is a highly exceptional case and that they themselves did not escape royal discipline in the end, in the fourth century (Diodorus XVI.52.3). The Achaemenid satrap was not merely a civil servant, in the dismissive sense this term has in our contemporary society. He depended personally on the king, and he had to behave as a faithful *bandaka*; moreover, he was closely watched by the central authority.

The Satrap and the Armed Forces

One of the lessons Darius no doubt learned from the insubordination of Oroetes at Sardis was that, left to his own devices, a satrap had many resources for liberating himself from the central command. One of the advantages Oroetes counted on was the armed forces available to him—a guard of a thousand Persians and the forces he could draw from Phrygia, Lydia, and Ionia (Herodotus III.127). But was this power built into the system, or was it just a consequence of the temporary weakening of the central authority? In other words, did the satrap have full authority over the troops of the satrapy?

In the case of a special military expedition, the answer is clear. The example of Otanes against Samos as well as Ariaramnes against Scythia and Aryandes against Barca show unambiguously that the satraps and *strategoi* had to strictly obey orders sent from the central authority. In some cases, a satrap or high official was commissioned to command troops from a larger territory. These were the leaders whom the Greek authors called *karanos*—an institution known mostly from a reference by Xenophon. When Cyrus the Younger was sent to Asia Minor by his father Darius II, he carried with him the following royal order: "I send Cyrus as *karanos* of those who muster at Castolus," and Xenophon adds the explanation "*Karanos* means 'vested with full powers' (*kyrios*)" (*Hell.* I.4.3). We will come back later to the position of Cyrus the Younger. Suffice it to say here that other titularies of the same military rank are known beginning with the time of Darius I. We know, for example, several leaders in times of conquest who were granted the title "*strategos of the men who dwell in the coastal countries*" of Asia Minor, particularly Megabazus and Otanes.

But what about the permanent troops of the territories—the soldier-colonists of Babylonia, Egypt, and Asia Minor—were these troops available for the use of Persian magnates who were settled in the provinces, or even the garrisons? This question, unfortunately, can only be answered from late passages in Xenophon, all of them bearing the mark of generalization and schematization. In the same passage of the *Cyropaedia* that is dedicated to satraps' duties, Xenophon clearly distinguishes between military and satrapal duties. According to him, "Cyrus did not want to see the commanders of garrisons in the citadels (*phrouarachs*) and the *chiliarchs* of the guardposts scattered throughout the territory receive orders from anyone but himself" (VIII.6.1). When naming satraps, Cyrus clearly specified that the commanders of garrisons were to retain

the missions that had been entrusted to them. These are the instructions given to satraps: "To govern the people, receive the tribute, pay the militia, and attend to any other business that needs attention" (VIII.6.3◊). And further on, as always, Xenophon stresses that the measures taken by "Cyrus" were still respected in his time; for example, "the fashion in which the positions depending on the king (*hai hypo basilei phylakai*) are maintained is identical" (§§9 and 14). The king's goal is defined in this way by Xenophon: "He took this precaution in case any of the satraps, his head turned by his wealth or the number of his subjects, tried to rebel; he would immediately meet opposition on the spot" (§1).

In the *Oeconomicus*, Xenophon devotes a long passage to the complementarity of the "war work" and "peace work" of the Great King. Xenophon wishes to show that, mindful as he was of agriculture and horticulture, the Great King was also passionately concerned with the labors of warriors:

For all the peoples from whom he collected [tribute], he prescribed to each governor (*archōn*) the number of horsemen, slingers, and "shieldbearers" (*gerthophoroi*) he had to maintain (*didonai trophēn*); there had to be enough to keep the subjects obedient and to defend the country against any enemy aggression. Moreover he maintained guards (*phylakai*) in the acropolises. It was the governor entrusted with this duty who had to provision the soldiers of these garrisons (*phroura*); as for the king, each year he reviewed the mercenaries (*misthophoroi*) and all who were required to bear arms; all were gathered, except the garrison soldiers, to the "place of assembly" (*sylogos*) as it is called; then he himself inspected those that were close by his residence. As for those who were distant, he sent some of the Faithful to review them. (IV.5–6)

We see here the distinction between the *phourarch* ('garrison commander') who had to "defend the country as necessary" and "the governor of civil authority who supervised agricultural work." To Xenophon's way of thinking, the two domains were separate and complementary, for "those who work the earth badly no longer feed the garrisons and cannot pay their tribute." It would all be clear enough if Xenophon had not added the following conclusion: "Wherever there is a satrap, it is he who has the highest authority over both domains, civil and military" (§10–11)—as if, at this point, he was distinguishing archons from satraps. If we imagine that *archon* generically designates what we call a satrap, we see that one of the duties that fell to him was to supervise the maintenance of territorial troops. He was entrusted with furnishing supplies (*trophē*) to the garrison troops, no doubt in the form of rations assessed on the satrapal storehouses.

These passages in Xenophon have stimulated a large number of interpretations, and they raise a good number of difficulties. First of all we must emphasize the general context of the *Oeconomicus*. Discoursing on the ideal lifestyle of a Greek *kalos kagathos* ('beautiful and good'), Xenophon refers to the example of the Great King. In his description, we recognize an idealized image of Cyrus the Elder as well as Cyrus the Younger. His aim is thus not to expound on Achaemenid institutions per se; it is rather to discourse on ideal royalty. The conclusion is contained in the premises: only the king combines the prerogatives and virtues of both gardener and man of war. Terminological exactitude is hardly a dominant concern of Xenophon; here, as in other texts, the word *satrap* seems to be used very loosely. In one case, it seems to denote the head of a satrapy (§11) and in another, an official in the same class as the chiliarchs and phourarchs (§7).

One of the most difficult problems rests in the hierarchical relationship between the satrap and the garrison commanders. The problem is all the more puzzling in that we lack any evidence for the relationship that we might compare with Xenophon. We know that, after the conquest of Sardis, Tabalus was named commander of the citadel by Cyrus. But what was his relationship with the satrap, who was also appointed by Cyrus? By way of confirmation of the general rule offered by Xenophon (that satraps had authority over military commanders), the later example of Orontas, portrayed by the same author in the *Anabasis* (I.6), is often cited. Accused of treason, Orontas was indicted by Cyrus the Younger before a sham of a royal tribunal. It appears that when Darius II made Orontas general-in-chief, Cyrus held a higher rank than Orontas. As soon as word of Orontas's revolt was received, the new king, Artaxerxes, relieved Orontas of his responsibilities to Cyrus. But the conditions are too specific to be able to draw general conclusions from this late example of Orontas. However, we can conclude that his relations with Cyrus had been modified between the time of Darius II and the time of Artaxerxes II.

But above all, Xenophon's passages, like many other Greek texts, are too allusive to explain the complexity of concrete situations. The only case that is well documented is the case of the garrison of Syene-Elephantine. Originally, the garrison soldiers were organized into companies (*dgalîn*; each numbering perhaps 1000 men); each *dgal* was subdivided into centuries (companies of 100) and decuries (companies of 10), each including soldiers of different ethnic backgrounds. The garrison was led by the *rab hayla*, which corresponds to the Greek *phrourarch*. The earliest attested incumbent is the Persian Ravaka in 495 (DAE 2 [AP 1]). The garrison commander was under the orders of the 'governor' (*frataraka*), a subordinate of the satrap. Despite some superficial analogies, the Elephantine documents provide no confirmation for the theoretical views of Xenophon.

Let us now consider a Babylonian tablet dated between about 509 and 500 that is particularly interesting:

A letter of Guzānu (chief priest of Sippar): To my brother Širku:

May the gods Bēl and Nabū ordain for you health and life.

Every day you have been telling me lies in Babylon. You used to say: "Libluṭu, the chariot driver, and your shield-bearer (lit.: third-man-on-the-chariot) are assigned to you in the rolls." But when the commander of the fortress (*rab birti*) came here, he withheld from my contingent not only Libluṭu but all the chariot drivers, asserting: "They belong to me!" and he also took away the shield-bearers who were with me. You, who were supposed to assert my claim before him, have in reality handed over to him what belongs to me!

And now Libluṭu the chariot driver is in charge of the (transport) of boats for the town Da[. . .]nu. You must not put under his command (my) chariot drivers, shield-bearers, or citizen-soldiers. He must not claim from the commander of the fortress my soldiers illegally. And you, say to Aikal-ana-mār-Ēsaggil as follows: "Give him (Libluṭu other) soldiers in place of (Guzānu's) soldiers!" The curse of King Darius be upon you: release the *gardu*-soldiers as I have already ordered you.

Please consider: at your disposal are the gate guards and all the chariot drivers, also the contingent of Dakūru-tribesmen who are stationed in Babylon; do not claim soldiers which belong to my "chariot fief!" (*bīt narkabti*; VS 6.128; trans. A. L. Oppenheim [Letters no. 143; CT 22: no. 74])

The tablet refers to a struggle over jurisdiction. Guzānu may have been the administrator (*šangu*) of the Ebabbar, the Šamaš temple in Sippar, unless he was governor (*šakin*

tēmi) of Babylon. He overwhelms Širku, who was supposed to defend his interests, with reproaches. The citadel commander in Babylon had in fact recruited soldiers who were under the authority of Guzānu—soldiers who, apparently, were supposed to be transferred to a different royal official. These soldiers were mustered from a “chariot estate” and, apparently, a “horse estate.”

If we needed to rescue some of Xenophon’s statements, we might imagine that the commanders of the largest garrisons were appointed by the king, as were the satraps. The reason might be that it was in the citadels in provincial capitals that the treasure was deposited, entrusted to a special officer, the *gazophylax* (guardian of treasure), who apparently reported his activities directly to the central authority. But this observation does not imply that the garrison commanders were independent of the satraps, unless the king issued explicit orders to them (cf. Orontas at Sardis). It is hard to see how else the satrap could have successfully carried out one of his principal tasks, maintenance of order, if the phrourarchs were excluded from the chain of command. In case of mass mobilization of the royal army, it was to the satraps that the phrourarch turned to carry out the levies in their territories, by order of the king. The methods of mobilization ordered by Xerxes indicate this unambiguously (Herodotus VII.19, 26). In times of “peace,” the satraps clearly were required not only to feed the garrisons but to ensure logistic and tactical coordination. It was they who were ultimately responsible for the good condition of the troops presented at the annual review. Xenophon also states, “[Cyrus] gave orders to all the satraps he sent out . . . to organize companies of cavalry and charioteers from the Persians who went with them and from their allies” (Cyr. VIII.6.10♦), and also, “After showing how each satrap had to carry out his instructions, after giving each an armed force, he sent them out and warned all of them to make ready for the expedition planned for the following year and for a review of the men, arms, horses, and chariots” (§15). Nothing in the *Oeconomicus* passage formally contradicts this interpretation.

The discussions in the *Cyropaedia*, however, can be explained in large part by the author’s motives: he wanted to show that Cyrus had taken every measure to avoid the disintegration of central authority (described at length in the last chapter of book VIII), Xenophon included a passage on the relationship between satraps and garrison commanders that is completely consistent with his own approach but for which no sure confirmation can be found anywhere else.

Royal Inspectors

In the same context of the *Cyropaedia*, there is a reference to the periodic inspection of the satraps (Cyr. VIII.6.16♦):

We have noticed also that this regulation is still in force, whether it was instituted by Cyrus, as they affirm, or not: year by year a man makes the circuit (*ephodeuei*) of the provinces with an army, to help any satrap that may need help, to humble any one that may be growing rebellious, and to adjust matters if any one is careless about seeing the taxes paid or protecting the inhabitants, or to see that the land is kept under cultivation, or if any one is neglectful of anything else that he has been ordered to attend to; but if he cannot set it right, it is his business to report it to the king, and he, when he hears of it, takes measures in regard to the offender. And those of whom the report often goes out that “the king’s son is coming,” or “the king’s brother” or “the king’s eye,” these belong to the circuit commissioners (*hoi ephodoi*); though sometimes they do not put in an appearance at all, for each of them turns back, wherever he may be, when the king commands.

A large number of Greek authors of the fifth and fourth centuries refer to an institution called the king's Eye: Aeschylus, Aristophanes, and Plutarch refer explicitly to a person bearing this title during the reigns of Xerxes, Artaxerxes I, and Artaxerxes II. Herodotus, in his version of the "founder legend," says that among the high officials with which the young Cyrus surrounded himself was a king's Eye. Since later texts state that there were actually numerous Eyes and Ears of the king, it has frequently been deduced that the provinces were watched over by a corps of royal spies, reporting any rebelliousness or dereliction to the king.

That the central authority took measures to control the satraps is certainly beyond question. It was entirely necessary for them to be assured that royal commands were being carried out. Xenophon also touches on the topic in the *Oeconomicus* in the context of troop reviews: "As for the soldiers who are distant [from his residence], the king sends some of the Faithful (*pistoi*) to review them" (IV.6). In the *Cyropaedia*, Xenophon disagrees with the opinion prevailing in Greece:

Indeed, we are led to think that the offices called "the king's eyes" and "the king's ears" came into being through this system of gifts and honours. Cyrus' munificence toward all who told him what it was well for him to know set countless people listening with all their ears and watching with all their eyes for news that might be of service to him. Thus there sprang up a host of "king's eyes" and "king's ears," as they were called, known and reputed to be such. But it is a mistake to suppose that the king has one chosen "eye." It is little that one man can see or one man hear, and to hand over the office to one single person would be to bid all the others to go to sleep. Moreover, his subjects would feel they must be on their guard before the man they knew was "the king's eye." The contrary is the case; the king will listen to any man who asserts that he has heard or seen anything that needs attention. Hence the saying that the king has a thousand eyes and a thousand ears; and hence the fear of uttering anything against his interest since "he is sure to hear," or doing anything that might injure him "since he may be there to see." So far, therefore, from venturing to breathe a syllable against Cyrus, every man felt that he was under the eye and within the hearing of a king who was always present. For this universal feeling towards him I can give no other reason than his resolve to be a benefactor on a most mighty scale. (VIII.2.10–12♦)

Despite the efforts of Iranists to find vocabulary of Persian origin, not one item in the Achaemenid corpus confirms the existence of such an institution. A word in the Aramaic documents from Egypt, *gaušaka*, has often been thought to parallel the Greek expressions, but the comparison does not seem definitive. The *gaušaka* was actually a satrapal inspector who, upon the summons of a community, came to make an inquiry on the spot accompanied by "judges and policemen(?) who—[like themselves]—are placed over the province of the Southern District" (DAE 101 [AP 27]).

Royal Letters and Satrapal Subordination

We have also seen how Darius's envoy Bagaeus knew how to impress the Persians at Sardis with royal letters, which were taken metonymically as the royal word itself (III.128). The royal couriers were inviolable in their person—hence the seriousness of the accusation against the same Oroetes (III.127). For the Persians, the reading of a royal message took on a character as impressive as an order given directly by a king in the flesh: did it not start out with "Saith Darius the King"? Polyaeus (VII.21.5) records that the satrap Datames, upon receiving a letter from King Artaxerxes II, performed the rite of *proskynesis* before it and offered the sacrifice customary for good news. Satraps and/or

generals received royal instructions that they had to follow to the letter. There are many examples. When Aristagoras brought Artaphernes the proposal to conquer Samos, the satrap gave his approval in principle but made the following response to the Milesian: "The only other thing we need is to get the king's approval." It was not until he received the royal letter that he undertook military preparation (Herodotus V.31–32♦). In a general way, the heads of provinces did not have the right to take the smallest military or diplomatic initiative (e.g., Xenophon, *Hell.* IV.8.16–17). In order to justify their actions, they exchanged many letters with the central authority (e.g., Xenophon, *Anab.* I.5.2–3) or visited the court (e.g., *Hell.* I.3.9; IV.8.16; Diodorus XIV.39, 81; XV.4.2). The generals refer explicitly to royal letters that were composed extremely carefully (cf. Herodotus VI.97, 101). The Persian satraps frequently plead for an exception from royal control in order to make a diplomatic or military decision (cf. Xenophon, *Hell.* I.5.5; III.2.20; 4.5–6, 11, etc.). It was otherwise very unusual for a king's instructions not to be followed word for word. For example, Otanes proceeded to massacre the Samians, contrary to Darius's order, which said "not to kill or capture any Samian, but to hand the island over to Syloson intact" (Herodotus III.147). But there were good reasons for his acting against orders: contrary to assurances that they had given, Maeandrius and his men had massacred "the Persians of the highest rank," who, after making the agreement, "were sitting on their chairs of state" (III.144–45).

If a satrap intended to disobey, he knew well that he risked being denounced before the king—as is shown by the prelude to the revolt of Cyrus the Younger against his brother (chap. 15/2). Many examples in fact show that the satraps or the *strategoí* were frequently denounced, wrongly or rightly, by other satraps or by high provincial officials. In all likelihood, in such cases the suspect satrap was ipso facto called to court—as were, for example, Bardiya/Tanyoxarces by Cambyses and Ochus by Sogdianus (according to Ctesias, §10, 47). The satrap then had to answer the accusations brought against him before the king himself. Moreover, to lead a war presupposes the requisite financial and military means. We can be sure that neither the treasurers nor the managers of storehouses would furnish a speck of merchandise without receiving instructions from the central authority, worked out to the penny. It was not simply up to the satrap himself to order the minting of coins. We will also see that the fixing of a tribute rate by Darius in principle relieved the satraps of any possibility of adjusting the amount of tribute assessments (see also chap. 10/2). While the Babylonian tablets and the Aramaic documents from Egypt show that in each satrapy justice was rendered by the satrap and his subordinates, many examples also show that the Great King could intervene in decisions at any moment if the local populations exercised their right of appeal; this provided a means of tempering and controlling the possible arbitrariness of the satraps (see chap. 12/4).

Satrapal Courts and the Royal Court

Xenophon explains that one of the satrap's fixed obligations was to organize his court on the model of the central court (Cyr. VIII.6.10–13). Unfortunately, we have only a handful of documents that portray these satrapal courts, except in the areas that held special fascination for the Greek authors. The luxury and furnishings of the satrapal courts never failed to spark the imagination of the Greeks. The example of Pausanias of Sparta shows that some Greeks were dazzled by the Persian lifestyle in Asia Minor, as had been even more true of Polycrates of Samos at an earlier period (chap. 2/6).

In particular, the Greek authors give consistent accounts of the satrapal paradises, along with their resorts. These allowed a life of luxury characteristic "of satraps and kings" (Quintus Curtius VII.2.22). The description of Cyrus the Younger's paradise at Sardis given by Xenophon (*Oec.* IV.20–25) is familiar, as is Plutarch's description of Tissaphernes' paradises in the same town: "One of them was the handsomest, because its lawns and its refreshing waters, its retreats and its manicured lawns displayed an unimaginable royal luxury" (*Alc.* 24.7). This description is not dissimilar to the description of the paradise laid out near Cyrus's tomb at Pasargadae (see chap. 2/7 above). Every satrap had at least one, including Persia (chap. 11/5). In Asia Minor alone, in addition to the paradise at Sardis, Xenophon describes others at Celaenae and Dascylium. At Celaenae, Xenophon's companions were able to see "a great park, filled with wild animals . . . and watered by the Meander" (*Anab.* I.2.7). Xenophon's description of the paradise in Dascylium (*Hell.* IV.1.15–16) is particularly evocative:

That is where Pharnabazus maintained his residence, with handsome, large villages all round, abundantly provided with all the resources, and with game both in enclosed paradises and in the open spaces—magnificent game! Through the whole length flowed a river stocked with every kind of fish. Wildfowl were there in abundance as well, for those who might hunt for birds.

Xenophon's description is illustrated in the scenes on certain bullae from Dascylium (some dating from the reign of Xerxes). Numerous kinds of birds are depicted there, including a falcon holding a lobster in its beak.

One of the satrapal customs that the Greeks often elaborated on (having endured it themselves) was the routine of the satrapal audience. For instance, in order to obtain money from Cyrus the Younger, the Spartan Callicratidas, despite all his proud prejudices, had to resort "to go and beg at the doors of the king's commanders, as Lysander had done." Upon his arrival at the gate of Cyrus's palace, the guard let him know that Cyrus "was busy drinking." He soon endured a new rebuff, and "he took it hardly and set off for Ephesus" (Plutarch, *Lysander* 6⇨). In Xenophon's report, Cyrus made Callicratidas wait two days: "Callicratidas was unhappy with this delay, furious with having to wait so long at the Gate." Callicratidas complained later: "When I went to find Cyrus, he put off doing what I asked day after day, and I could not find satisfaction without endlessly going to the Gate" (Xenophon, *Hell.* I.6.6–10). These long delays became proverbial. To highlight the haughty nature of Aspasia (Pericles' companion), a comic author wrote, "You could get an interview with Pharnabazus quicker than with her!" (Athenaeus XIII.570c).

Of course the problem of imperturbable officials was not limited to the satrapal courts of Asia Minor. We can see it in Egypt in the mishaps of the person portrayed in the *Petition of Peteisis*: "For seven months I tried to get justice from the governor or his officials, with no success, because Pkoip, the administrator of Teuzoi, who had gone to Memphis, plotted against me and told everyone, 'Keep him from reaching the governor!'"

The satraps' table-fare was perceived as an additional tax on subject populations (chap. 10/4) and was no less striking to the imagination than other customs. One of the many ways in which Pausanias manifested his "Medization" was by his table, "served in the Persian style" (Thucydides I.130.1). Imitating Xerxes' tent that was captured after the battle of Plataea (Herodotus IX.82), the satraps' tents also served as dining rooms, whose opulence always astonished the Greeks. Tiribazus of Armenia's tent had "silver-footed

couches in it, and drinking cups, and people who said that they were his bakers and his cup-bearers" (Xenophon, *Anab.* IV.4.21). As for Agesilaus, he pretended to look down on the luxury flaunted by Pharnabazus, who "had arrived in expensive splendor. . . . His servants spread at his feet those carpets on which the Persians love to loll lazily" (Xenophon, *Hell.* IV.1.30). The best description of a Persian general's tent appears in the book of Judith, namely, the tent of Holofernes, into which the heroine is conducted: "Holofernes was resting on his bed under a canopy of purple and gold studded with emeralds and precious stones." When he left the tent, it was "with silver torches carried before him" (Judith 10:21–22♦). Judith was then taken to the place where his silver dinner service was laid, and quantities of food and wine were ready (Judith 12:1). The looting after the murder of the Persian gives an idea of the richness of his surroundings: "The people looted the camp for thirty days. They gave Judith the tent of Holofernes, all his silver plates, his divans, his drinking bowls and all his furniture" (Judith 15:11♦). All of these texts give an idea of the richness of the satrapal palaces. Satraps arranged banquets according to the royal model, such as Cyrus the Younger's banquet described by Aelian in his story about the adventures of Aspasia (VH XII.1).

It is clear, then, that in all of the activities of the satrapal court, the arrangements were identical to those of the central court, whether it was audience rituals (when Cyrus the Younger received people in his palace at Sardis, he was seated on a chair of gold and silver: Xenophon, *Hell.* I.5.3) or organizing banquets or hunts. On this point, the material Xenophon gives in the *Cyropaedia* sounds right: in their provinces, the satraps had to act and behave in the image of the king: "they had to imitate everything they saw Cyrus do" (VIII.6.10). Among all of the measures recorded by Xenophon, there are two that seem particularly significant: "To obligate all those who were to receive land and an official residence to frequent the [satrap's] Gate. . . . To educate at the Gate . . . the children who would be born." To put it another way, the Persian youths of the provinces received at the satraps' Gates the education that the Persians of Persia normally received. The Persian provincial nobility was invited to transform itself into a court nobility. Isocrates also confirms this fact (in his own way); the better to condemn the failings of the barbarians, he writes: "Therefore, those of them who go down to the seashore and whom they call satraps do not appear unworthy of the education of their country and keep the same customs" (*Paneg.* 152). All of these arrangements were intended to conserve the political and cultural homogeneity of the Persians of the imperial diaspora. So this epigram from the *Palatine Anthology* (IX.423) makes perfect sense: "Sardis, the king's Persia in Asia."

6. *The King and His Faithful:*

The Persians, the Greeks, and the Others

Sources and Problems

Before drawing general conclusions (chap. 8/7 below) from the preceding analyses, we need to broach a question that so far has deliberately been set aside: Were Persians the sole beneficiaries of the imperial system of favors? The question is particularly legitimate because the inquiry has been conducted almost exclusively on the basis of Greek sources, which list many more Greeks than Persians among the Benefactors and among the persons the king honored with court titles, gifts, and favors. Has reality been constructed in a way that fits the corpus of evidence?

To read Herodotus, the Greeks held a decisive place close to the kings. According to him, for example, Demaratus played a major role in the choice of Xerxes as heir, in preference to Artobarzanes (VII.3), and Histiaeus had Darius's ear (V.106-7). Themistocles arrived at court just at the time of the accession of Artaxerxes I, and the new king put total confidence in him. Entirely in character, Herodotus gives the definition of the royal *euergetes* ('Benefactors') with regard to Greeks, who he states were called *orosangae* in Persian (VIII.85). Then he gives the names of Theomestor and Phylacus of Samos, who were rewarded for their valor at Salamis: "Theomestor in reward for this service was invested by the Persians with the tyranny of Samos, and Phylacus was enrolled in the catalogue of the King's Benefactors and presented with a large estate (*khōrē*)." Further on, we again gain the impression that, of all the participants in Salamis whose names the royal secretaries recorded, only the Greeks were honored by Xerxes (VIII.90: Samothracian ship)! Similarly, in his passage on the preparation for Xerxes' expedition, Herodotus appears to assign a disproportionate role to the Athenian diviner Onomacritus (VII.6).

The evidentiary context thus requires a more careful analysis of the place of Greeks in Darius's entourage. In fact, there are several who obtained advantages and preferences: Democedes, the physician from Crotona, was rewarded with gold for healing Darius's sprain, but also with an estate (*oikos*) and a court title, "Tablemate" (Herodotus III.130-32). For giving Darius a purple cloak at the time of Cambyses' expedition to Egypt, Syloson was made tyrant of Samos (III.130-49). Coes was made tyrant of Mytilene in 512 (V.11) because he counseled the king judiciously (IV.97). Another Ionian, Histiaeus of Miletus, was rewarded at the same time with a land grant in the country of the Edonians in Thrace (V.11); then Darius brought him to Susa, promising that he would be his Tablemate and counselor (V.24). Herodotus also records the arrival of Demaratus to see Darius, after he had been exiled from Sparta. Quite a few other Greek exiles are known, especially from the time following the Persian Wars. Many of them—Themistocles is one of the best-known cases—received cities in Asia Minor from the Great Kings, following a procedure already attested in Cyrus's time. Among them were Gongylus, Demaratus, and their offspring, who received lands and towns in Troas from Xerxes. In some cases, even entire Greek communities were collectively honored by the king: "At Acanthus, Xerxes issued a proclamation of friendship to the people and made them a present of a suit of Median clothes, with many expressions of approval for their enthusiastic support of the war and for the work they had done on the canal" (VII.117). In another city, Abdera: "Xerxes is known to have . . . made a pact of friendship with the people there, and to have given them a golden scimitar (*akinakēs*) and a gold-embroidered headband" (VIII.120).

There is no disputing that there were many Greeks at the Great King's court. But the composition of Herodotus's audience (he addressed Greeks principally) and, more generally, the Hellenocentric orientation of the available sources tend to influence our interpretation. It is clear that, although the Great King used Greek representatives, it was only for the relations they maintained with the Greek cities. When Pausanias acquired the (relative) confidence of Xerxes, it was because Xerxes hoped to turn it to his advantage in the continuing war against the Greeks in Asia Minor: "In agreement with the noble Artabazus, whom I sent to you, see to my affairs with full confidence and conduct them most gloriously and however is best for both." So says Xerxes in a letter attributed to him by Thucydides (I.130.3). In other words, Pausanias was subordinate to the initia-

tives of the Persian Artabazus (who had just received the satrapy of Dascylium), and he had to act in the royal interest. The same was true of Themistocles, who said to the king: "Today, likewise, I have the opportunity to do much good for you, and here I am, pursued by the Greeks, because of my friendship with you" (Thucydides I.137.4). Plutarch in turn comments as follows: "They even say that in successive reigns, in which the affairs of Persia were more closely intertwined with the affairs of Greece, whenever the kings needed a Greek, every one of them wrote letters promising that he would be more prominent at court than Themistocles" (*Them.* 29.9). Furthermore, when Themistocles went back down to the sea, it was "to take up the affairs of Greece" (30.1). "The king hoped, through [Themistocles], to see the Greek world enslaved" (Thucydides I.138.2).

But as Plutarch notes in passing (31.3), the Great King's gaze was not fixed constantly on the shores of the Aegean. And Aelian (*VH* I.22) is careful to state—since it would not be self-evident to his readers!—that the gifts given to ambassadors by the king were not reserved for Greeks alone. There were of course representatives of other peoples at court, such as Udjahorresnet, who followed Cambyses when he departed from Egypt and who resided for some time at Darius's court. When he returned to Egypt, it was because it was profitable to do so. In other words, in every conquered country, the Great King found collaborators (in the neutral sense) ready to serve his interests, as long as they received royal rewards that would bring them wealth and prestige—of which Udjahorresnet boasted: "I was honored by all my masters; [as long as] I lived(?) they gave me finery of gold and made me every useful thing" (Posener, no. 1D).

Foreigners and the Court Hierarchy

The question is, even when Greeks (or other foreigners) had court titles (including Benefactor) or prestige gifts (robes, jewelry), were they on an equal footing with Persian nobles? An explicit passage in Plutarch entertains some doubt. He says that Themistocles was especially honored by the Great King "because he participated in the royal hunts and the palace entertainments . . . , and he even became a friend of the king's mother." The Persian nobles at the court, however, reacted rather badly, and Plutarch explains their irritation: "It is true that the honors he received were nothing like what had been done for any other foreigner" (*hoi alloi xenoï*; *Them.* 29.6). A similar interpretation is found in Thucydides (I.138.2): "Themistocles then took on an important position with the king, as no Greek had ever done before." In fact, as Plutarch explains later on, satiated by the great *dōrea* he enjoyed at Magnesia, the Greek "was honored as an equal to Persians of the first rank" (*timōmenos homoia Persōn aristois*; *Them.* 31.3). We may also recall the case of Entimus the Cretan, who participated in Artaxerxes II's "dinner of the Kinsmen." Phaenias (quoted by Athenaeus II.48f*) stresses the exceptional nature of such an honor's being granted to a Greek: "The Persians took umbrage at this, because they felt that the honour was being vulgarized (*dēmeuomenē*)."

To illustrate the special position of Themistocles, Plutarch records how the king refused to grant Demaratus the privilege (considered obviously disproportionate) "of making his entry to Sardis, on horseback, with the tiara set in the royal manner upon his head." This request aroused irony in the king's cousin Mithropastes and the anger of Xerxes. Themistocles had to intervene to reconcile the king with the Spartan exile (29.8). Obviously, as a Greek, Demaratus did not know his place, probably supposing that royal favor made him an equal of Persians of the highest distinction. This was also

true of the Spartan Pausanias, if Thucydides is to be believed. When Pausanias received Xerxes' letter, his ambition grew in unwonted proportion:

He grew unable to live in the customary fashion: he left Byzantium dressed as a Mede; he toured Thrace with an escort of Medes and Egyptians; his table was served in the Persian mode; unable to contain his emotions, he revealed through his trivial behavior what he was planning later on a grand scale. Eventually he proved difficult to approach. (Thucydides I.130.1-2)

Pausanias clearly hoped that, through his behavior as a Persian satrap, he would be identified with the dominant socioethnic class. Upon reading Xerxes' (ambiguous) reply, he was perhaps convinced that the king had implicitly agreed to one of his ambitions: to wed a daughter of the Great King (§ 128.7). There was no clear basis for this—Xerxes was completely silent on this point. Obviously—just like Demaratus—Pausanias had not understood that, despite his assurances of loyalty to the king, his Greek origin prohibited him from ever achieving the position of a Persian aristocrat in the king's entourage.

Persian Ethnicity

To be thorough, we must also mention Metiochus, son of Miltiades, the old Athenian tyrant of the Chersonese. During the reconquest subsequent to the Ionian revolt, Metiochus was captured by the Phoenicians and brought to Darius:

The king, however, far from doing any harm to Metiochus, treated him with the greatest liberality; he presented him with a house (*oikos*) and property (*ktēsis*), and a Persian wife, by whom he had children who lived as Persians (*es Persas hekosmeatai*). (Herodotus VI.41)

Here we have an extremely rare case of a non-Persian marrying a Persian woman. We also know of the marriage of Gygaea, daughter of Amyntas of Macedonia, to the Persian Bubares. Of this union was born "a son who stayed in Asia, named Amyntas after his maternal grandfather, who enjoyed by the king's gift the revenues of the important Phrygian town of Alabanda" (VIII.136). But the difference between the two examples is obvious. In all probability, Amyntas (who kept a Macedonian name) was not recognized as a Persian, in contrast to the sons of Metiochus. It is also clear that Metiochus's sons' acceptance as native Persians—their "naturalization," as it were—resulted from royal favor, which there is every reason to consider exceptional.

The Ethnic Composition of the High Imperial Personnel

The ethnic composition of the highest ranking personnel clearly illustrates the privileged place that the Persians held in the Empire that they had conquered and the proceeds of which they fully intended to keep for themselves. The fact that local elites were recognized does not contradict this principle, since positions held by local elites were limited, at least under the first kings, to posts without political influence (see chap. 2/6 above). To begin with a region that is better documented than others—Egypt—we see that, beginning in the time of Darius, the leaders of the Egyptian satrapy were Persians. This was true of the satraps themselves (Aryandes, then Pharandates) and also, at Syene–Elephantine, of Parnu and Ravaka, as well as of the leaders of the expedition to Cyrenaica, Amasis and Badres. Even Ariyawrata, *saris* of Coptos, and his brother Atiyawahy were Persians.

The Greek texts, the Elamite tablets from Persepolis, the Babylonian tablets, the Egyptian documents, and several references in the Behistun inscription provide sufficient documentation on the satraps to compile a table that is statistically significant:

Babylonia	Gubāru (535–525), Uštānu (521–516), Īhuta-x-x (486), to whom Bagapā (503) may perhaps be added
Egypt	Aryandes (522?–ca. 510?); Pharandates (519–492), Achaemenes (484–ca. 462)
Sardis	Oroetes (ca. 525–520); Artaphernes (513–492)
Dascylium	Mitrobates (ca. 525–522); Oebares (493); Artabazus (479)
Cappadocia	Ariaramnes (514)
Susa	Bakabana (ca. 500–495)
Media	Hydarnes (ca. 520[?]-ca. 499) [PF: Miturna]
Bactria	Dādarši (522), Artapan (ca. 500–465?)
Aria	Harbamišša (Arbamisa)
Arachosia	Vivāna (522); Bakabaduš
Carmania	Karkiš

The distribution of military command is also quite impressive. First of all, of course, we have the catalog of Xerxes' army. As Herodotus explains, the commanders of major divisions, in both the infantry (VII.82) and the navy (VII.97), were all king's men, often highborn Persians. Second, a look at the major expeditions leaves no doubt about the ethnicity of the commanders:

Samos (520–519)	Otanes (Herodotus III.142)
Barca (513)	Amasis and Badres (IV.167)
Scythia (514?)	Ariaramnes (Ctesias §15)
Scythia (513)	Gobryas, among those close to Darius (Herodotus IV.132, 134)
Thrace (512)	Megabazus (IV.143; V.1–24)
Head of the shore troops:	Otanes (V.25)
Naxos (500)	Megabates (V.32–35)
Ionia (500–493)	Artaphernes, Artybius, Daurises, Hymaees, Otanes (V.108ff.)
Thrace (492)	Mardonius (VI.43–45)
Europe (490)	Datis (the Mede) and Artaphernes (VI.94)
Europe (480–479)	Mardonius (VIII.100–101)
Asia Minor (479)	Tigranes (IX.96)
Furymedon (466)	Tithraustes and Pharandates (Diodorus XI.60–61); Ariomardos, son of Gobryas, according to Callisthenes (Plutarch, <i>Cimon</i> 12.5)
Egypt (456?)	Pharandates and Artabazus (Diodorus XI.75, 77)

The statistical picture in the Persepolis sources is the same. Except for the administrative workers (*kurtasš*), of course, and specialized jobs (such as Babylonian scribes), the core of the personnel who governed lands, men, and workplaces was of Persian origin.

Despite this fairly substantial documentation, at least two problems remain. For one thing, the description "Persian" may sometimes be ambiguous. In some cases, the label may simply have designated one of the king's men. The uncertainty disappears when the family and/or ethnic background of the person are expressly given—which is fairly frequent in the Greek authors, consistent in the Behistun inscription, and quite noteworthy in a remarkable Persepolis tablet (PT 4). On one occasion, Herodotus includes a very valuable detail: the commanders of the expedition against Barca are described as

"Amasis, a man of the Maraphian tribe, to command the former, and Badres of the *genos* Pasargadae" (Herodotus IV.167♦). For another thing, as we know, the Iranian onomastic is largely unmarked for ethnicity. Absent any relevant details, therefore, we must remain circumspect about the ethnic background of people, especially since it is not impossible that non-Iranians took Iranian names when they were incorporated (in one way or another) into the dominant socioethnic class.

In any case, the presence of Iranians other than Persians around the king is not open to doubt. Specifically, we know of Datis, to whom nearly all the ancient sources assign a Median origin; two of his sons, Harmamithras and Tithaeus, commanded all the mounted troops of Xerxes in 480 (Herodotus VII.88). We also know that in 522, alongside the Persian generals (Hydarnes, Vaumisa, Hystaspes, Vivāna, Vidafarnah, Dādarāši of Bactria, Artavardiya, Gobryas), Darius appointed an Armenian, Dādarāši (sent to Armenia) and a Mede, Takhmaspada (sent to Sagartia). This callup of Median generals was nothing new; Cyrus also had several around him. Other sources refer explicitly to non-Persian Iranians: at the heart of the conspiracy against Darius described by Aelian (VH VI.14) was the Hyrcanian Aribazus, who was supported by "several of the most distinguished Persians"; among "the most influential persons" around Cambyses, Ctesias lists Artasyras, a Hyrcanian (§9); Artasyras's son Artabanus "acquired around Xerxes the influence his father had had around Darius" (§20).

In sum, the statistical data permit only one conclusion: to direct the satrapies and lead the armies or even to command the garrisons (besides Parnu and Ravaka at Syene-Elephantine, cf. Boges at Eion and Mascames at Drabescus: Herodotus VII.106–7; 113), Darius and, later, Xerxes drew massively on representatives of the Persian aristocracy. The composition of the Empire's highest officials strikingly shows that it was ruled by an ensemble of great aristocratic families united around the dynasty and the cultural traditions of the Persian people. From the inception of the Empire, it was this dominant socioethnic class that held power from the Indus to the Mediterranean and intended to keep it. The elites of the subject nations or the Greek political exiles might receive important positions but not positions of political influence such as satraps or *strategoī*. They collaborated closely with the Persians, but they were not co-wielders of power. The honors and favors they might receive from the king did not place them ipso facto on an equal footing with the representatives of the great families. Finally, among the subject peoples, the Medes doubtless retained a special place, albeit secondary and of diminishing importance.

7. Achaemenid Royalty and Persian Aristocracy

Power and Kinship

To some extent, the Great Kings were able to turn the conflicts that might arise between dynastic power and the power of the great aristocratic Persian families to their advantage. The Persian nobles could closely identify with the dynastic ethic because they shared the guiding principles. By instituting a system of gifts "with strings attached," court hierarchy, and education based on monarchic values, the Great Kings succeeded in insinuating themselves into the aristocratic circles. Family solidarity, though it did not disappear, was diminished by the establishment of a personal relationship (*bandaka*) between each aristocrat and the king. Because of this, the kings had no need for head-on assaults on the solidarity of the aristocratic families, which was the usual matrix for social and demographic reproduction.

Consequently, the aristocratic houses were drawn into the monarchic sphere, though they conserved their social role. Heraclides' account of the organization of the king's table and the tables of the heads of aristocratic houses is full of information. Even when the Persian aristocrats invited their own Tablemates to dinner, they were still obligated to lunch at the royal table, where they were recognized as the most honored of the royal Tablemates (Athenaeus IV.145f–146a). This division of social space/time admirably exemplifies the double allegiance of the Persian aristocrats—toward their family clan and toward their king. But all of the measures taken by the kings (court hierarchy, obligation to attend at court, training of the noble youth according to dynastic norms) strongly prompted the aristocrats to give unfailing priority to the king. A new stage was reached in the integration of the nobility when, at some unknown date, kinship vocabulary infiltrated the court hierarchy.

At the same time, the similarities in the organization of the royal family and the aristocratic families show that the Achaemenid dynasty itself continued to function according to the rules and values common to the entire aristocracy. The kings behaved no differently than a certain Mentor, who took an active part in raising the ten sons of his brother-in-law Artabazus: "Mentor was so enchanted with the large number of children born to the marriage that he promoted the lads, giving them the most distinguished commands in the armed forces" (Diodorus XVI.52.4♦). The highest official in the royal administration of Persia at the time of Darius was Parnaka, whose seal calls him "son of Arsames." He was thus in all probability Darius's cousin through his father Arsames, brother of Hystaspes. This Parnaka/Pharnaces fathered the "satrapal dynasty" of Hellepontine Phrygia, through Artabazus, who was named to the post by Xerxes in 479–478. Darius's father himself held a very important position in Parthia-Hyrcania in 522. One of his uncles, Artabanus, influenced him a great deal; two of Artabanus's sons (Tritantaechmes and Artyphius) commanded units in Xerxes' army (Herodotus VII.26, 66). One of Darius's brothers, "his brother by the same father," Artaphernes I, was satrap of Sardis around 500 (Herodotus V.25♦, 30, 73, 100), and he kept this position until 492 at least (PF 1404–5). To lead the squadron against Samos, he chose his son Artaphernes II, Darius's nephew, who in 490 led the army against Greece with Datis and who in 480 was one of the contingent commanders of Xerxes' army (VII.74). Around 500, another cousin of Darius, Megabates, commanded the fleet (V.33); he may have been the father of Megabazus, who in 480 was one of Xerxes' admirals (VII.97); another(?) Megabates bears the title of admiral in a tablet from the reign of Darius (PT 8).

The number of Darius's sons in Xerxes' army is also very impressive—no less than twelve by five different mothers. Some commanded land or sea contingents; several were killed in action. In the battle of the Eurymedon, the generals were Tithraustes, illegitimate son of Xerxes, and Pharandates, a nephew of the king (Diodorus XI.60.5; 61.3). In Artaxerxes I's entourage, we encounter one of his cousins, Mithropastes (Plutarch, *Them.* 29.7). For the reconquest of Egypt, Artaxerxes I also sent an army commanded by Achaemenes, his own brother by Darius (Ctesias §32; Diodorus XI.74.1). Quite a few satraps were also chosen from the immediate family: Bardiya (Cambyses' brother by Cyrus), Artaphernes (Darius's brother by Hystaspes), Artarios (Artaxerxes I's son), Cyrus the Younger (Darius II's son and Artaxerxes II's brother), and so on. The difference is that, in the case of the royal family, kinship relations were intermingled with the rationale of dynastic succession; the great aristocratic houses were excluded

from this, but they were invited to ally themselves devotedly and faithfully in the defense of dynastic continuity.

The Dynastic Pact

The speech that Xenophon writes for Cambyses (father of his Cyrus) illustrates forcefully what might be called a dynastic pact (Cyr. VIII.5.22–26). Addressing the Persian aristocracy, he first states that this Empire, conquered by force of arms, is a Persian Empire. He summons the nobles to assist the king in maintaining Persian dominion over the subject peoples. Cambyses especially stresses the common interests that the king and the Persian nobility have in the face of the danger presented by rebellions by the conquered peoples. If Persian dominion is not retained, the nobles risk losing all of the advantages that conquest brought them: “And you, Persians, if any enemy people attempts to bring an end to the dominance (*arkhē*) of Cyrus, or if any conquered people attempts to defect, you shall intervene, both for yourselves and for Cyrus, in accordance with the orders he will issue to you” (§25).

This is also what Chrysantas says to his peers, echoing Cambyses in these words: “It must be understood perfectly that Cyrus will never be able to employ us for his own advantage without it also being for our own, since our interests are the same and our enemies are the same” (VIII.1.5). By the gifts and positions they received, the aristocrats drew economic profit from conquest, profits that they risked losing if they were to dissociate from the king, since they knew perfectly well the precariousness of their position. When Agesilaus tried to persuade Pharnabazus, satrap of Hellespontine Phrygia, to ally with the Greeks against the king, he tried to lure him with the possibility “of no longer reinforcing the king’s power but his [own] by reducing his companions to slavery (*homodouloi*) to make them his dependents (*hypēkooi*).” Pharnabazus responded straightforwardly:

Well! If the king were to send someone else to be general and place me under his orders, I would agree to be your friend and ally. But if he entrusts the command to me—which is, I think, a noble ambition (*philotimia*)—you had better understand that I will make war on you to the best of my abilities. (*Hell.* IV.4.37)

Put another way, the gifts/services exchange was included in the “dynastic pact,” by which the king undertook—absent blatant treachery or obvious error by a satrap or a *strategos*—to protect and favor his Faithful (*bandaka*).

Synchrony and Diachrony

The efficacy of the system over the *longue durée* can only be judged in hindsight. While in general the relationship between the monarchy and the aristocracy continued to rest on the foundations described above, there certainly were developments, over the course of time, which we will analyze in their proper place. The transformations may have involved the actual composition of the dominant socioethnic class, because of the ongoing, very close intimacy between the Persians of the imperial *diaspora* and the local elites. Transformations also have occurred during periods of dynastic troubles. Although the “dynastic pact” implied that the balance of power was very strongly tilted in favor of the Great King, it is clear that some periods of turmoil resulting from problems of succession or from external wars created special conditions, to which we shall return at the proper time (see especially chaps. 15/2, 17/2, 18/2).

PART THREE

Territories, Populations, and
the Dependent Economy

Chapter 9

Territories, Communication, and Trade

1. The Network of Roads

The ancient authors were literally fascinated by the vast extent of the Achaemenid imperial territory. Many of them include full discussions or at least remarks on the communications system within the Empire. They all recognize a relationship between regularity of communication and the ability of the central authority to make its presence felt in the conquered countries. Some, especially in the fourth century, insist—not unpolemically—on the impossibility of the king’s mastering the imperial territory, especially since he had to gather his forces from throughout his domain (cf. Xenophon, *Anab.* I.5.9, II.4.3; Diodorus XIV.22.2; Isocrates, *Paneg.* 165; Quintus Curtius III.2.9, etc.). Others, however, were particularly struck by the contrast they saw between the vast extent of the Empire and the rapidity of communication.

The Royal Roads

In his tale of the preparations for the Ionian revolt, Herodotus describes the diplomatic tour of Aristagoras of Miletus to various Greek cities in Europe that he hoped to enlist as allies. In order to persuade King Cleomenes of Sparta, Aristagoras carried “to the interview a map of the world engraved on bronze” (V.49♦). Apparently, Herodotus used a document like this to give details “on the road leading from the sea to the king,” that is, the road linking Sardis to Susa, which, he writes, “traverses populated, secure regions.” For each region, Herodotus gives the distance in parasangs (a Persian measure equivalent to about 5.4 km), the number of hostels and stopping places found in the stations (*stathmoi*), and the rivers crossed and guardposts placed at regular intervals all along the way (V.52–54♦). This is the route traditionally called the Royal Road.

Regarding the extent and regional divisions of the Achaemenid road network, however, Herodotus’s description is fragmentary. In this passage at least, his eastern geographical horizon extends no farther than Susa and Babylonia; he apparently knows nothing of the roads to Persia or *a fortiori* of the roads across the Iranian Plateau and Central Asia. It is particularly unfortunate that Ctesias’s work on the subject has not survived: “In it he described the relays (*stathmoi*), days elapsed, and parasangs between Ephesus and Bactra and India,” says Photius (*Persica* §64). The Persepolis tablets have the advantage of representing the view from the center—even though not all the information from the tablets has been published yet. While the Susa–Persepolis connections are the most frequently attested, the following also appear: Bactra (2 mentions), Carmania (9 or 10), India (7), Arachosia and Kandahār (11), Aria (4), Sagartia (2), Media (1), Babylonia (1 or 2), Egypt (1), and Sardis (3). The entire imperial territory is covered. The Royal Road from Sardis to Susa is thus just one royal road among many others (cf. also Diodorus XIX.19.2: [*hodos*] *basilikē* between Susiana and Media via Babylonia; Ps.-Arist., *Oecon.* II.2.14b [Caria]; RC 20 [Hellespontine Phrygia], etc.). This is why the Hellenistic-period sources are so important: they cover (however unevenly) all the territories formerly dominated by

the Great Kings. The chroniclers of military operations enable us to reconstruct the duration of this or that movement of the army on the march: from Babylon to Susa: 22 days (Diodorus XIX.55.2); from Susa to Persia: about 30 days (XIX.17.6); from Susa to Ecbatana via the royal road across Babylonia: 40 days (XIX.19.2); from Susa to Ecbatana by the direct path across the Cossean mountains of Luristan: 9 days (XIX.19.8); from Ecbatana to Persepolis: 20 days (XIX.46.6); etc.

Added to the variety of information given by Herodotus and Xenophon, the data taken from the military authors (both Classical and Hellenistic) enable us to reconstruct generally, if not in detail, the network of major Achaemenid roads—keeping in mind that the accounts of military campaigns only consider roads from the point of view of the provisions the army might be able to find there. We may note first that the capitals of the Empire (Pasargadae, Persepolis, Susa, Babylon, Ecbatana) were linked by major highways, in a rough quadrilateral. The best-known itinerary is Persepolis–Susa, since it can be reconstructed not only by analyzing Alexander's route but also from the Persepolis tablets: there were about twenty stops between Persepolis and Bezitme (near Susa). According to the Hellenistic authors, crossing the Fahliyun region took nine stages, from Parmadan to Dasher. From Susa to Ecbatana, the royal road avoided the central Zagros (Luristan), since the direct route crossing Cossean country was "difficult and narrow, skirting precipices" (Diodorus XIX.19.2♦). The main road took a longer route across the Babylonian plain before veering east to reach the Iranian Plateau near Behistun. From Ecbatana, another road reached Persia by Gabae (Isfahan) and ended up at the Persian Gulf at Bushire.

Furthermore, the variety of countries named in the tablets shows that the capitals were connected to all the provinces in the Empire. Northward, the venerable Khorasan road joined Ecbatana to Bactra, via Rhagae [Teheran], the Caspian Gates, Hyrcania, and Parthia. Southward, leaving Fārs, one could travel to Arachosia (Kandahār) and Gandhara (Kabul area), and from there to Bactra as well as to the Indus Valley. The North Road and the South Road were joined by a transverse road used by Cyrus and then Alexander via Aria (Artacoana/Herat), Drangiana (the Helmand basin and land of Ariaspi), and Kandahār. From Kandahār, another itinerary (used by Craterus in 325) gave access directly to the Indus Valley through the Bolan Pass.

Toward the Mediterranean there were two main itineraries that coincided from Susa to Arbela (east bank of the Tigris). From Arbela, Herodotus's Royal Road reached Sardis via the upper Tigris and upper Euphrates, Armenia, and Cappadocia, the Halys, Greater Phrygia (Celaenae), and the Meander Valley. Here is Herodotus's version:

<i>Region crossed</i>	<i>Parasangs</i>	<i>Stops (stathmoi)</i>
Lydia–Phrygia	94.5	20
Cappadocia	104	28
Cilicia	15.5	3
Armenia	56.5	15
Matiene	(137)	(3)4
Cissia	42.5	11

The figures presented here include corrections to the manuscript tradition. The route of Herodotus's Royal Road is still controversial, which is rather surprising, especially

within Cappadocia and Cilicia. In all, he writes, the route stretched some 13,500 stadia, if we agree (with him) that 1 parasang equals 30 stadia—thus about 2,500 km. And he ends with: "At 150 stadia per day, the journey would take 90 days." Adding the Ephesus-Sardis leg (140 stadia), he estimates it would take three months and three days to travel from the sea to Susa.

In another itinerary, known mainly from an Aramaic document (*DAE* 67 [AD 6]), to which we shall return at length (chap. 9/2 below, 364ff.), travelers left Arbela for Damascus and Egypt. Some of the stops on the itinerary are the well-known cities of Arbela and Damascus, but also Lahiru, which is known from several Babylonian texts of the same period (Darius II). We may add that by this route, leaving Thapsacus on the Euphrates, one can travel to Cilicia via Aleppo; this was a route frequently taken by people who landed on the Cilician coast or set sail from there for Asia Minor or Greece. Xenophon's story in the *Anabasis* also shows that a road led from Cilicia to Sardis via the Cilician Gates, Cappadocia, Greater Phrygia, and the Meander Valley, according to the following itinerary, where Xenophon gives the distances in parasangs and the stops (*stathmoi*):

<i>From</i>	<i>Crossing</i>	<i>To</i>	<i>Parasangs</i>	<i>Stops</i>
Sardis	Lydia	Meander	22	3
	Phrygia	Colossae	8	1
Colossae	Phrygia	Celaenae	3	3
Celaenae	Phrygia	Peltae	10	2
Peltae	Phrygia	Ceramon-agera	12	2
Ceramon-agera		Caÿstru-pedion	30	5
Caÿstru-pedion	Phrygia	Thymbrium	10	2
Thymbrium	Phrygia	Tyraeum	10	2
Tyraeum	Lycaonia	Iconium	20	3
Iconium	Cappadocia	Dana	25	4
Dana	Cilicia	Cilician Gates	25	4
Cilician Gates	Cilicia	Psarus River	10	1
Psarus River	Cilicia	Pyramus River	5	1
Pyramus River	Cilicia	Issus	15	2
Issus	Cilicia	Syrian Gates	5	1
Syrian Gates	Syria	Myriandrus	5	1
Myriandrus	Syria	Chalos River	20	4
Chalos River	Syria	Dardas River	30	3
Dardas River	Syria	Thapsacus	15	3
Thapsacus	Syria	Araxes River	50	9
Araxes River	"Arabia"	Corsothe	35	5
Corsothe	"desert"	Pylae	90	13
Pylae	Babylonia		12	3
?	Babylonia	Cunaxa	3	1
			499	77

It is clear that this itinerary was regularly used long before the expedition of Cyrus the Younger; thus the strategic importance of Cilicia.

Secondary Itineraries

Of course, these itineraries are concerned only with the network of royal roads; many other itineraries, often much shorter and often following mountain or desert routes, are left out. We learn about the latter most often from accounts of military expeditions. This is how, for instance, we know of a road between Miletus and Sardis that enabled the Ionians (with Ephesian guides) to launch a surprise attack on the Achaemenid capital of Asia Minor; the same road was used a century later by the satrap Tissaphernes when he was trying to intercept Agesilaus's army, which was returning from Sardis to Ephesus by the major road that crossed the Karabel Pass. Another example is the itinerary followed by Alexander between Fahliyun and the Persian Gates, while the bulk of the army and its supplies were sent to Persepolis by "the plains route" or the "wheelworthy route." Similarly, in Hyrcania Alexander took the shortest road, over the crest, while he sent the convoy by the military road (*via militaris*). A last example is chosen from many others: when Cyrus the Younger, then at Iconium, sent Epyaxa to Tarsus by the quickest mountain route, some of the escort disappeared. Two explanations were in circulation, each more disturbing than the other: some said the escort was cut to pieces by the Cilicians; others thought that the soldiers had become lost and were unable to find their way. It was in fact impossible to travel by such routes without local guides.

The narrowly military orientation of the Classical sources, however, requires us to be cautious. A route that they considered unusable may not necessarily have been so for everyone in normal times. Here, for example, is what Arrian says (*Indica* 43.3) about a road between Egypt and Babylonia by way of northern Arabia:

The soldiers of Cambyses' army who were able to reach Susa, the relief troops sent by Ptolemy son of Lagos to Babylonia across Arabia to aid Seleucus Nicator, crossed an isthmus and hurried to traverse that whole parched, desert country in eight days, on camelback. Their pack animals carried the necessary water and they traveled by night; by day they could not endure the open air because of the heat. The region beyond the isthmus just mentioned, between the Arabian Gulf [Red Sea] and the Erythrean Sea [Persian Gulf] is thus far from habitable, since the northern part is desert and sand.

The road just described in fact crossed a terribly inhospitable region. But it must be recalled that when they describe a country as "desert," the Greek authors in context are referring to the march of a major army, which needs supplies of fresh water relatively close together. Xenophon explains this when he recounts Cyrus's march up the east bank of the Euphrates: "Some stages were quite long, because Cyrus always wanted to get to where there was water and fodder" (I.5.7). This is also why Cyrus sought the assistance of the king of the Arabs on his march to Egypt in 525: "[The Arabian king would] fill camel-skins with water, load them on to all his live camels, and so convey them to the desert, where he awaited the arrival of [Cambyses'] troops" (Herodotus III.96)—exactly as Esarhaddon had done in 671 on his own Egyptian campaign (ANET³, 292). The people whom the Greeks called Scenite (tent-dwelling) Arabs had dromedaries and a knowledge of the country that enabled them to overcome obstacles that would have appeared truly insurmountable for the commander of an army.

Let us give one more example (from many others). When Alexander found himself in Drangiana (Seistan), he wanted to get a message to Ecbatana in Media. To do this in ten days instead of a month by the main road, the terrible Salt Desert of the Iranian Plateau had to be crossed. Alexander entrusted the mission to Polydamas: "He put off the

dress which he was wearing and put on an Arab costume. Two Arabs . . . were given him as companions. They arrived at the designated place on the eleventh day, traversing on camels places which were even made desert by dryness" (Quintus Curtius VII.2.18♦). Here the word "Arab" is used generically: it simply designates the nomadic populations that were accustomed to crossing the desert, "mounted on racing camels [dromedaries]" (Diodorus XVII.80.3).

Road Building and Maintenance

Royal roads, in contrast to the others, were most often broad—what the ancient authors called 'wheelworthy' (*hamaxitos*)—that is, accessible to chariots. This description is used, for example, of the roads from Phrygia to Cilicia, Susa to Persepolis, Susa to Arbela, and across Hyrcania. Horsemen and pedestrians were not the only users of these major roads. Many travelers, civil and military, used chariots, which Aeschylus called "rolling tents" (*Persians* 1000). These traveling chariots, called 'chariot carriages' (*hamamaxa*) by the Greeks, must be distinguished from the light chariots (*harma*) used for war or hunting (Herodotus VII.41; cf. VIII.83; Xenophon, *Anab.* I.2.16).

We must stress that the word *hamaxitos* 'wheelworthy' does not mean that these roads were paved. They no doubt were dirt roads of various widths but well maintained and marked. A Hellenistic text (RC 18), for instance, refers to an "old road that the nearby peasants turned to cultivation" in Hellespontine Phrygia. The reference in fact is to a 'royal road' (*hodos basilikē*; RC 20); the detail may be surprising, but Herodotus also mentions that, after 480–479, "The road which King Xerxes took remains untouched to my day; the Thracians hold it in profound reverence and never plough it up or sow crops on it" (Herodotus VII.115♦). Because the roads were dirt, trips became difficult during the rainy season or in more or less swampy locations. This is illustrated perfectly in a passage from Xenophon's *Anabasis* (I.5.7–8♦):

Once in particular, when they came upon a narrow, muddy place which was hard for the wagons to get through, Cyrus halted with his train of nobles and dignitaries and ordered Glus and Pigres to take some of the barbarian troops and help to pull the wagons out, but it seemed to him that they took their time with the work; accordingly, as if in anger, he directed the Persian nobles who accompanied him to take a hand in hurrying on the wagons. . . . Leaping at once into the mud, they lifted the wagons high and dry and brought them out more quickly than one would have thought possible.

It is quite clear that the management of a system of roads so vast required a sizable, specialized administration. By way of comparison, note that in T'ang China the road network was directed by 21,500 officials assigned to the various roads and 100 high officials at work in the capital. The evidence being what it is, we have only limited information on the comparable department in the Achaemenid Empire. Some of the Persepolis tablets seem to refer to a corps specializing in the maintenance of existing roads and building new ones. About 43 km of the Persia–Media road has been surveyed between Naqš-i Rostam and Mazdahneh (between Shiraz and Isfahan). Traces of Achaemenid roads have also been found south of Pasargadae, in the picturesque gorge of the Tang-i Bulaki on the Pulvar: a 1.7 m–wide road cut sometimes 10 m deep into the rock. It is clear that the construction and maintenance of such roads required a considerable work force. It is likely that in Persia itself the *kurtas* were called up, but, there and elsewhere, so was the peasantry in the form of *corvée* (cf. Aelian, *Anim.* XV.26; Diodorus XVIII.32.2). It

fell to the satraps and their subordinates to maintain the roads that crossed their territory, as is implied by a passage in Pseudo-Aristotle (II.2.14b \diamond) on the administration of Condalus, one of the satrapal subordinates of Mausolus in Caria:

And any trees which projected over or fell into the royal roads (*hodoi basilikai*) he used to sell . . . the produce taxes.

During military campaigns, it was the army's job. Here is how Xenophon's Cyrus informs the pioneers, or 'road builders' (*hodopoioi*), of their special tasks (Cyr. VI.2.36 \diamond):

You superintendents of the engineering corps have here from me a list of the spearmen, the archers, and the slingers, whose names have been stricken from the roster. You must require those of them who were spearmen to carry on the march a woodcutter's axe, those who were bowmen a mattock, and those who were slingers a shovel. With these tools they are to march in squads ahead of the wagons, so that, in case there is any need of road-building, you may get to work without delay, and so that, if I require their services, I may know where to find them when the time comes.

Herodotus describes road-makers at work in 480. In Pieria, Xerxes gave a third of the army the job of deforesting the country to build a reliable road (VII.131). Road-makers show up again in 322–321, when Alexander's funeral chariot left Babylon for the Mediterranean coast: accompanied by many specialists (*technitai*), they were clearly ordered to prepare and improve the road the chariot was to take (cf. Diodorus XVIII.28.2). A few years earlier, in 333, the Thracians had opened a road (*hodopoiein*) between Phaselis and Perga (Arrian I.26.1).

Bridges and Bridge-Builders

The greatest rivers were spanned by permanent bridges, including both the Euphrates and the Tigris (cf. Herodotus I.186). In his description of the Sardis–Susā road, Herodotus takes care to enumerate the rivers the road crossed: the Halys, the Euphrates, the Tigris, the Little and the Great Zab, the Diyala, and the Choaspes. At least one bridge was built across the first of them, guarded by a fort (*phylaktērion*) and gates (*pylai*). Obviously, Herodotus is talking about a permanent bridge (V.52). Herodotus calls the other rivers (Upper Euphrates, Upper Tigris, Little and Great Zab, and Choaspes) 'boat-carry' (*nēusiperētos*) rivers, which must mean that they were crossed by means of pontoon bridges (V.52). Xenophon's *Anabasis* clearly shows that this is how all of the rivers were crossed by Cyrus's troops on the march to Babylonia. Xenophon often gives only the widths of the rivers, but it seems clear that in most (if not all) cases they were provided with pontoon bridges, like the bridge of "seven boats tied together" on the Meander (I.2.5). The Euphrates, about 1000 m wide at the level of Thapsacus, must have been forded, since the satrap Abrocomas had burned the boats during his retreat to Babylon (I.4.11–18), as the Persians did later on in the face of Alexander's advance (Arrian III.7.1–2). On the Tigris, Xenophon also mentions a bridge of 37 boats braced together (II.4.17, 24), and another bridge at the level of Opis (II.4.25).

In Babylonia, Xenophon distinguishes bridges proper (*gephyra*) from bridges made of boats tied together (II.4.13). But he includes no details of the construction of the bridges proper. They may have consisted of a few palm trunks thrown across a canal (II.3.10) or even some planks resting on piles of rocks (Quintus Curtius V.5.4: near Persepolis). There must also have been bridges on permanent pilings, like those discovered near Persepolis and Pasargadae. But building a complex bridge of this sort poses difficult technical problems, as Arrian explains in connection with Alexander's crossing of the Oxus (Amu Darya):

It is the greatest river in Asia, at least of those Alexander and his men had encountered, except for those in India. . . . Alexander tried to cross it, but the river appeared to him absolutely impossible to traverse. It was in fact six stadia [ca. 1 km] wide, but its depth bore no relation to its width, which was proportionately much greater; the bottom was sandy, the current swift, so that the pilings that the men were driving into the bottom were easily carried away by the current, seeing as they were fixed in nothing but sand. (*Anab.* III.19.2-3)

It was much easier to use pontoon bridges on the Mesopotamian rivers, since the water level varied considerably from season to season. Here is how Arrian describes the Roman technique:

On signal, the boats are unfastened and left to the current of the river, not straight and prow-forward, but like boats towed by the stern. The current seizes them, naturally, but they are restrained by a rowboat until they halt at the desired spot. There, pyramidal wicker baskets filled with rough stones are dropped into the water from the prow of each boat, to hold them against the current. When the first boat has been set in this manner, the next, separated from the first by a distance related to the weight it will have to bear, is anchored in turn facing the current; immediately, beams attached to each other by boards nailed across them are placed on these two joined boats; and so the work proceeds, following the line of as many boats as are needed to cross the river. On each side of the bridge proper panels attached to the deck are placed, facing outward, which serve as guardrails for the horses and vehicles, and also to connect the elements of the bridge together more securely. The whole thing is finished in a short time but with a great deal of noise; nonetheless, discipline is not wanting throughout the operation. The cheers for this or that boat do not interfere either with the commands or with the efficiency. (V.7.3-5)

Arrian goes on to say that he cannot report "how Alexander managed to throw a bridge across the Indus, since even those who were on the campaign with him will not talk about it. But, in my opinion, his technique for building the bridge must have been very like the Roman technique, and if he did it some other way, good for him!" We know in any case that Alexander's army included a corps of bridge-builders who, for instance, had to set two pontoon bridges across the Euphrates at Thapsacus to replace the ones the Persians had destroyed (*Arrian* III.7.1-2). The technique of the Macedonian specialists was likely the same as the Persians', since in this area the Balkan countries seem not to have had any special traditions. The existence of such specialists may be confirmed by a Babylonian document that reports that a group of "bridge-builders" held *ḫaṭru* lands near Nippur.

In 513, to cross into Europe, Darius had a boat-bridge set up on the Thracian Bosphorus. The architect was a Samian named Mandrocles (*Herodotus* IV.87-88). In 480, Xerxes ordered two bridges to be built across the Hellespont at Abydos, at a width of seven stadia. Specialists from several countries worked on it: Phoenicians, who spun cables of white linen; and Egyptians, who brought cables made of papyrus (*byblos*). After the first, unsuccessful attempt (the bridges were carried away by a storm), the engineers succeeded. Here is *Herodotus's* description (VII.36♦):

The method employed was as follows: penteconters and triremes were lashed together to support the bridges—360 vessels for the one on the Black Sea side, and 314 for the other. They were moored slantwise to the Black Sea and at right angles to the Hellespont—in order to lessen the strain on the cables. Specially heavy anchors were laid out both upstream and downstream—those to the eastward to hold the vessels against winds blowing down the straits from the direction of the Black Sea, those on the other side, to the westward and towards the Aegean, to take the strain when it blew from the west and south. Gaps were left in three places to allow any boats that might wish to do so to pass in or out of the Black Sea.

Once the vessels were in position, the cables were hauled taut by wooden winches ashore. This time the two sorts of cable were not used separately for each bridge, but both bridges had two flax cables and four papyrus ones. The flax and papyrus cables were of the same thickness and quality, but the flax was the heavier—half a fathom of it weighed 114 lb. The next operation was to cut planks equal in length to the width of the floats, lay them edge to edge over the taut cables, and then bind them together on their upper surface. That done, brushwood was put on top and spread evenly, with a layer of soil, trodden hard, over all. Finally a paling was constructed along each side, high enough to prevent horses and mules from seeing over and taking fright at the water.

2. Control of the Imperial Territory

Satrapal Authorizations

The royal roads themselves were “safe to travel by, as [speaking of the Sardis-to-Susa road] it never leaves inhabited country,” to repeat a phrase Herodotus used (V.52♦)—which is to say, there was risk of neither famine nor ambush. For the military historians, these were also the routes by which the armies could easily be resupplied. But their use required a prior official authorization, called *halmi* (sealed document) in the Persepolis tablets, Category Q. This is precisely what is contained in the letter provided by Aršāma to his steward Neḫtiḫōr in a well-known Aramaic document (DAE 67♦ for the names [text: AD 6♦]):

From Aršāma to Marduk the officer (*peqid*) who is at X [place name], Nabūladanī the officer who is at La’ir, Zātuyvaha the officer who is at ‘Arzūḫin, ‘Upastabara the officer who is at Arbela, Ḥaḷṣu and Māt-āl-Ubaš, Bagafarna the officer who is at Sa’lam, Frādafarna and Gawzīna the officers who are at Damascus. And now:—behold! one named Neḫtiḫōr, [my] officer (*peqid*), is going to Egypt. Do you give him (as) provisions (*ptp*) from my estate (*beth*) in your provinces every day two measures [1.7 l] of white meal, three measures of inferior meal, two measures [1.7 l] of wine or beer, and one sheep, and hay according to (the number of) his horses; and give provisions for two Cilicians (and) one craftsman, all three my servants who are going with him to Egypt, for each and every man daily one measure of meal; give them these provisions, each officer of you in turn, in accordance with (the stages of) his journey from province to province (*medinah*) until he reaches Egypt; and, if he is more than one day in (any) one place, do not thereafter assign them more provisions for those days. Ba-gasarū is cognizant of this order: Rašta is the clerk.

The interest of this letter is that it enables us to reconstruct the administrative process very precisely. Every official leader of a caravan had to have a sealed document that functioned as both a safe-conduct and a permit to travel, *halmi* in Elamite, **viyatika* in Persian (*miyatukkaš* = *halmi*). The *halmi* included the number of travelers, the amount of their rations, and the path to be followed. The royal roads were in fact marked out in stages, with postal relays and storehouses. This is what Herodotus is saying in his famous description: “At intervals all along the road are recognized stations (*stathmoi basileioi*), with excellent inns” (*katalysies*; V.52♦). This is the background for a financial maneuver reported by the irrepressible author of the *Oeconomica* (II.2.38), who describes Antimenes of Rhodes in Babylonia during Alexander’s time: “He ordered the satraps to fill, according to the custom of the country, the storehouses (*thēsauroi*) located along the Royal Roads.” The outcome of the story diverges somewhat from the strict rules of the Achaemenid administration: “Whenever an army or some other contingent passed through the country and the king happened not to be there, he would send a

sales team to peddle the merchandise that had been deposited in the storehouses!" The storehouse managers were not in fact empowered to disburse goods without satrapal authorization. Upon arrival at each stop, the leader of the caravan was required to produce this document, which allowed him to receive travel rations precisely in the amount indicated in the document he carried. Aršāma's letter also includes this clause: "and, if he is more than one day in (any) one place, do not thereafter assign them more provisions for those days" (DAE 67 [AD 6♦]). This provision indicates that, even if the travelers encountered an unforeseen difficulty or if they dawdled en route, they would have no right to supplementary rations. It also confirms that the stops and provisioning locations were generally spaced a day's journey apart.

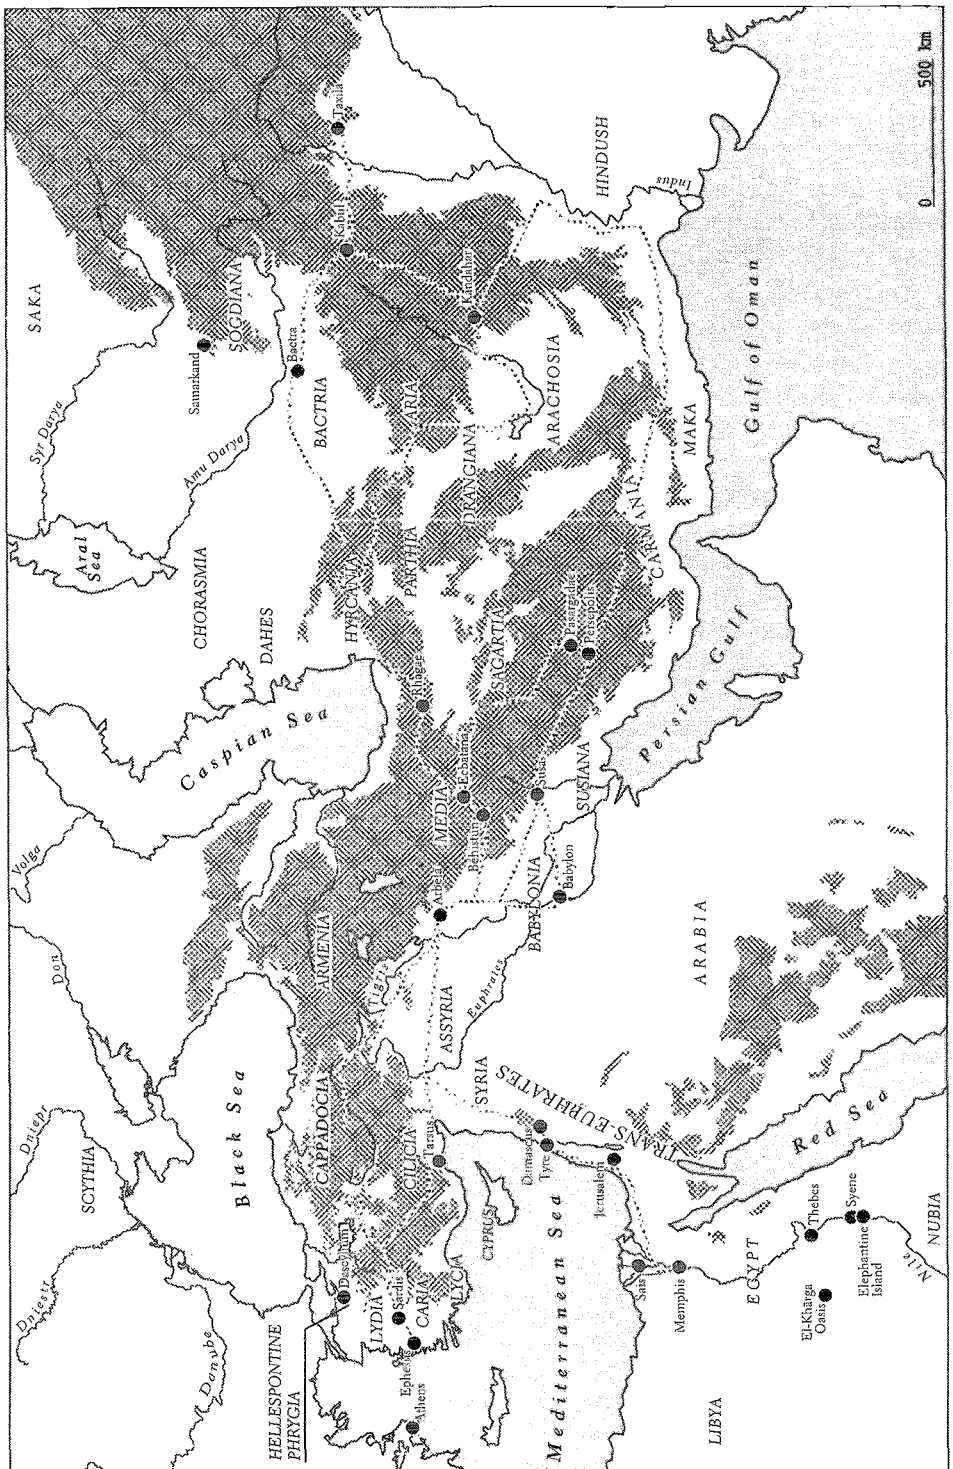

The tablets of Category Q exactly reproduce the vouchers prepared by the heads of the storehouses at the stops, to record the receipts and disbursements. As an example (chosen from hundreds), here is the text of one of these tablets:

4.65 BAR of flour, Dauma received. Each of the 23 men received 1.5 *qa*, and 1 *qa* for each "boy" (*puhu*). Dauma bore a document sealed by Irdarpirna. They were traveling from Sardis. They were headed to Persepolis. Month 9 of year 27. At Hidalu. (PF 1404)

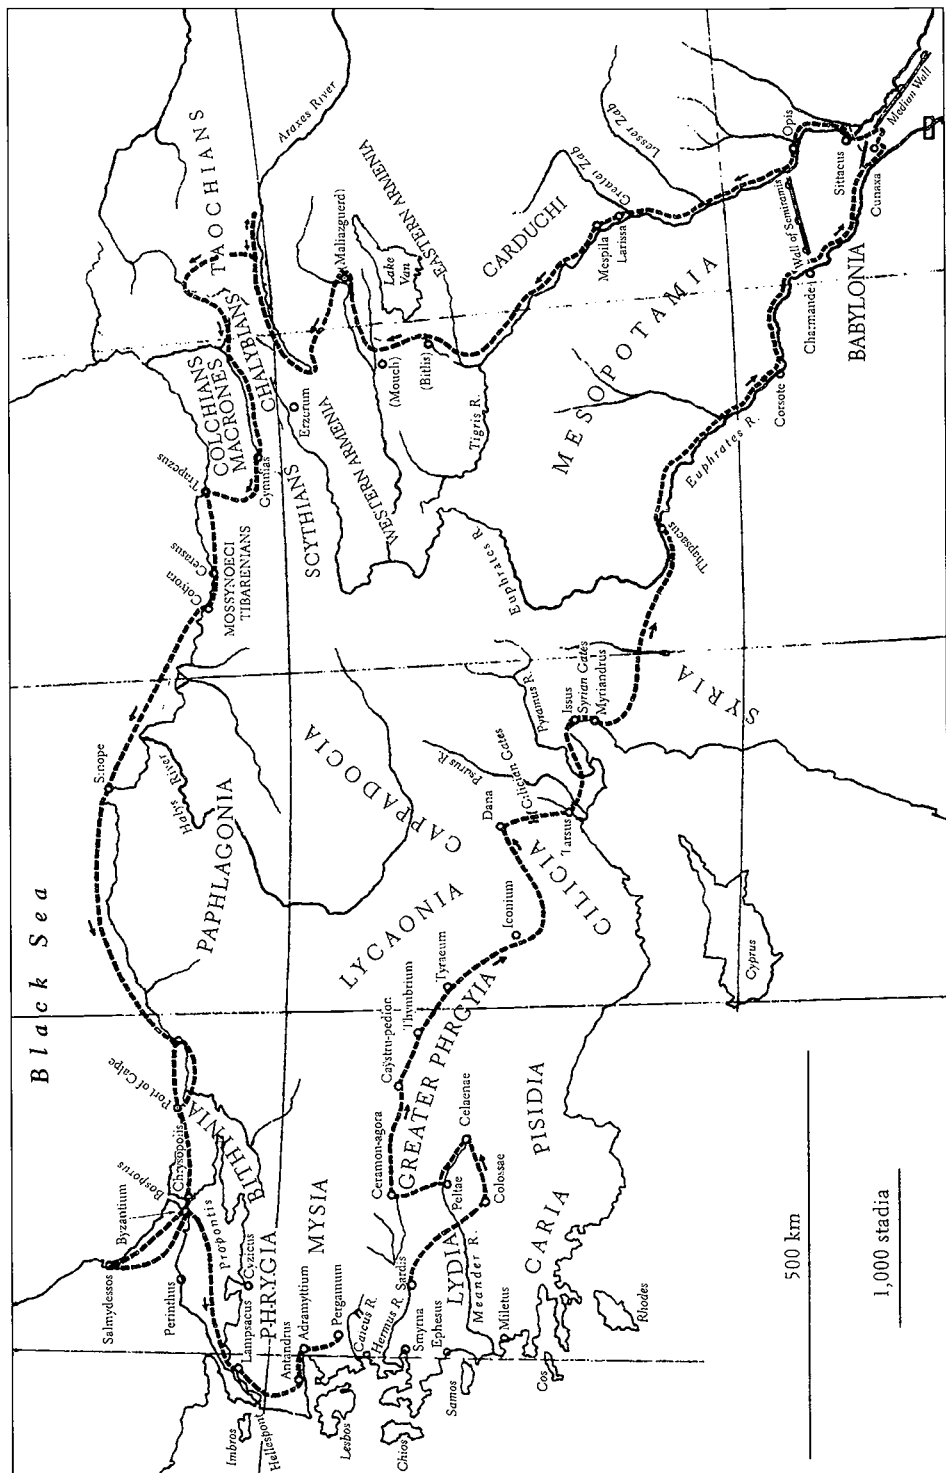

Irdarpirna can be identified as Artaphernes, Darius's brother, who we know from Herodotus was satrap of Sardis. In 495, then, he granted a *halmi* to Dauma, who was going to Persepolis, accompanied by several men and *puhu* (servants). The receipt was written at Hidalu, an important place on the border between Elam and Persia.

Later archival materials include some Aramaic ostraca from Arad, in Palestine, dated (paleographically) to the fourth century. They seem to attest to the existence of a way station where official travelers (doubtless military personnel) could receive rations for their animals.

The Classical sources confirm this practice precisely. Demosthenes, for instance, records that Charidemus reached Sestos only because he bore a safe-conduct (*adeia*) issued by Artabazus (C. *Aristocrates*: XXIII.159). Themistocles explains, in several of the letters attributed to him that, when he was exiled from Athens, he managed to reach the Achaemenid court. He requested authorization from the satrap Artabazus, who granted it to him: "He gave me two horses and the same number of attendants and sent me with 13 other Persians, who were in charge of the road and the provisions. They traveled by camelback" (*Letter* 30). In another version, Themistocles reached the king secretly, after disembarking at Aeolian Cyme (Plutarch, *Them.* 26.1). His prospects were even more unenviable because the king had put a price on his head. Luckily he fell in with a wealthy resident of Aeolian Aegae, Nicogenes, who "had relationships with the Persian nobles of the high country." By conniving this way, Themistocles was able to depart, concealed in an enclosed chariot usually used for women who were traveling. The case of Alcibiades also attests to the difficulty of evading satrapal surveillance. "He determined to go up to Artaxerxes. . . . As for how to travel in total security, he figured that [the satrap] Pharnabazus was most able to make it possible, and he sought him out in [Hellespontine] Phrygia." But, for his own reasons the satrap wanted at all cost to keep the Athenian from seeing the king, so he refused to cooperate with him. Alcibiades then tried to find the "satrap of Paphlagonia" by secretly taking the road from Dascylium, capital of Hellespontine Phrygia. Pharnabazus immediately sent a small contingent in pursuit, and it caught up with him in a Phrygian village, where he was executed. We thus see that access to the roads was jealously guarded. When Themistocles returned to the

Map 2. The Empire and its principal routes.

Map 3. The itinerary of Cyrus and the Ten Thousand.

coast somewhat later, he found that he was the object of hostility of an important Persian of Greater Phrygia, Epixyes. This man had posted some Pisidians with orders to slaughter the Greek when he appeared at Leontocephalae, a very important stop on the Royal Road. Themistocles was warned and took a back road (Plutarch, *Them.* 30.1). Surveillance was thus perpetual. For instance, the Greeks sent three spies to Asia Minor around 480, but it was not long before they were discovered, at the moment when they made contact with Xerxes' army in Sardis.

A satrap's consent was also required for official travelers, such as foreign ambassadors. When deputies from Athens and other Greek cities were sent to the king in 408, they had to await the goodwill of the satrap Pharnabazus. The first time, he "attempted to take the ambassadors to the king." The caravan wintered at Gordion in Phrygia, a stop on the Royal Road from Sardis to Susa. At the beginning of the following spring, they took to the road again "to seek out the king." As it happens, things did not work out, because the ambassadors ran into Cyrus the Younger, who had been sent by his brother Artaxerxes to take over operations in western Asia Minor:

Upon receiving this information, the Athenian envoys, especially when they had seen Cyrus, wanted more than ever to seek out the king—or else return home. [On orders of Cyrus,] Pharnabazus was able to detain them for a time, telling them sometimes that he would take them to the king, sometimes that they would return home. . . . After three years he asked Cyrus for permission to return them, saying he had taken an oath, and that he would take them back to the sea, since he would not take them to the king. They were sent off to Ariobarzanes, who was asked to provide an escort; he had them brought to Cius in Mysia, from where they left to join the rest of the army. (Xenophon, *Hell.* 1.4.6–7)

This enables us to understand the tenor of a proclamation voted by Athens in the 360s to honor Straton, the king of Sidon, who in fact "had done all he could to see that the ambassadors sent by the people to the king would have as good traveling conditions as possible" (Tod II, no. 139).

Military Escorts

Herodotus writes of the king's highway that it "crossed only inhabited, secure regions," indicating that the routes were closely watched. On the royal roads, traffic was closely monitored by the king's men. Overall, it fell to the king to maintain order and keep travelers safe from highwaymen. This is one of the characteristics of the "good king" as they are cataloged by Xenophon in his idealized portrait of Cyrus the Younger (*Anab.* 1.9.11–12♦):

None could say that he permitted malefactors and wicked men to laugh at him; on the contrary, he was merciless to the last degree in punishing them, and one might often see along the travelled roads people who had lost feet or hands or eyes; thus in Cyrus' province it became possible for either Greek or barbarian, provided he were guilty of no wrongdoing, to travel fearlessly wherever he wished, carrying with him whatever it was to his interest to have.

Nonetheless, despite the severity of punishment incurred by the miscreants, security could never be guaranteed at all times and in all places to the same degree. This is why caravans were usually escorted by armed men. When Nehemiah was sent to Jerusalem by Artaxerxes I, for example, he had "army officers and cavalry" with him (Neh 2:9♦). Previously, Ezra had made the same journey, accompanied by many Jews entrusted with gold and riches for the temple of Yahweh. The way Ezra describes the journey

shows that fear of attack was always present. He states in fact: "I should have been ashamed to ask the king for an armed guard and cavalry to protect us from an enemy on the road . . . the favour of our God was with us and protected us on the road from enemies and thieves" (Ezra 8:22, 31).

The Highway Patrol

Surveillance affected not only people but also the messages they were carrying. Three of Herodotus's anecdotes attest to the clever stunts used by people trying to evade the vigilance of the administration. The first portrays Harpagus the Mede when he wished to contact Cyrus secretly in Persia:

[Because] the roads were guarded, there was only one way he could think of to get a message through to him: this was by slitting open a hare, without pulling the fur off, and inserting into its belly a slip of paper on which he had written what he wanted to say. He then sewed up the hare, gave it to a trusted servant, together with a net to make him look like a huntsman, and sent him off to Persia with orders to present the hare to Cyrus, and tell him by word of mouth to cut it open with his own hands, and to let no one be present while he did so. The orders were obeyed. Cyrus received the hare, cut it open, found the letter inside and read it. (I.123–124♦)

Even more colorful is the subterfuge dreamed up by Histiaeus, who, while he was at Susa, wanted to contact his nephew Aristagoras, tyrant of Miletus, to incite him to revolt against the Persians:

[Histiaeus] was in difficulty about how to get a message safely through to him [Aristagoras], as the roads from Susa were watched; so he shaved the head of his most trustworthy slave, pricked the message on his scalp, and waited for the hair to grow again. Then, as soon as it had grown, he sent the man to Miletus with instructions to do nothing when he arrived except to tell Aristagoras to shave his hair off and look at his head. The message found there was, as I have said, an order to revolt. (V.35♦)

Last comes the story of Demaratus the Spartan, who was in exile in Susa and wanted to warn his fellow citizens in Sparta of Xerxes' upcoming offensive:

As the danger of discovery was great, there was only one way in which he could contrive to get the message through: this was by scraping the wax off a pair of wooden folding tablets, writing on the wood underneath what Xerxes intended to do, and then covering the message over with wax again. In this way the tablets, being apparently blank, would cause no trouble with the guards along the road (*hodophylakoi*). (VII.239♦)

Whether these stories are literally true is beside the point (it seems pretty clear that they are just stories). The important thing is whether they are woven on an Achaemenid warp. In each case they give voice to the difficulty an individual would have had in sending a message that did not bear an official seal; in all probability, it would have been seized by the guards along the road.

Royal Mail and Royal Couriers

When the ancient authors wrote of the vastness of the imperial territory, they were particularly struck by the institution of the royal mail. Xenophon (as usual) attributes the origin of the institution to Cyrus the Elder (*Cyr.* VIII.6.17–18):

We hear of another arrangement, devised to meet the huge size of the empire and enable the king to learn with great celerity the state of affairs at any distance. Cyrus first ascertained how far a horse could travel in one day without being over-ridden, and then he had a series

of posting-stations built, one day's ride apart, with relays of horses (*hippōnas*), and grooms to take care of them, and a proper man in charge of each station to receive the dispatches and hand them on, take over the jaded horses and men, and furnish fresh ones. Sometimes, we are told, this post does not even halt at night: the night messenger relieves the day messenger and rides on. Some say that, when this is done, the post travels more quickly than the crane can fly, and, whether that is true or not, there is no doubt it is the quickest way in which a human being can travel on land. To learn of events so rapidly and be able to deal with them at once is of course a great advantage.

Herodotus in turn (VIII.98♦) gives the following information on a Persian institution, the name of which he transcribes in Greek as the *aggareion*:

At the same time Xerxes dispatched a courier to Persia with the news of his defeat [at Salamis]. No mortal thing travels faster than these Persian couriers. The whole idea is a Persian invention, and works like this: riders are stationed along the road, equal in number to the number of days the journey takes—a man and a horse for each day. Nothing stops these couriers from covering their allotted stage in the quickest possible time—neither snow, rain, heat, nor darkness. The first, at the end of his stage, passes the dispatch to the second, the second to the third, and so on along the line, as in the Greek torch race which is held in honour of Hephaestus. The Persian word for this form of post is *aggareion*.

A Persian word, *astandēs*, known from several Greek texts, is the title borne by the future Darius III at court before his accession (Plutarch, *Alex.* 18.7; *Mor.* 326e). This is the definition in the *Suda*: “The *astandai* are the bearers of letters (*grammatophoroi*) who pass the messages successively one to the next (*ek diadochēs*)”; Hesychius calls them *hēmerodromoi* (couriers), *aggeloi* (messengers), and *krabbatoi* (which is much more obscure).

In the Greek stories, we find several examples of the use of such couriers. At the beginning of Aeschylus's *Persians*, the choryphaeus (leader of the chorus) longs for the arrival of a messenger (*aggelos*) or a mounted courier (*hippeus*), up to the very moment that Xerxes' messenger comes to bring the terrible news that “the barbarian army has perished entire” (vv. 13–14; 249–56). A few years earlier, when Darius, who was then at Sardis, wished to communicate his orders to Megabazus, who had been left in Thrace at the head of an army, “a messenger rode off with all speed to the Hellespont, crossed the water, and delivered the letter to Megabazus” (Herodotus V.14♦). The book of Esther shows how royal orders were communicated to every province in Ahasuerus's kingdom: “The couriers, mounted on the king's horses, set out in great haste and urgency at the king's command” (8:14♦).

The existence of these express messengers is confirmed by Persepolis tablets that use the word *pirradaziš*, which covers both the couriers and the horses they rode. This word clearly refers to the royal mail system that operated between the king and his subordinates in the provinces. One of the tablets (from Category Q) is particularly interesting. It reads:

Datiya received 7 *marriš* of wine as rations. He bore a document (*halmi*) sealed by the king. He came from Sardis on the express service (*pirradaziš*) and was going to the king at Persepolis. Month 11, year 27. At Hidali. (Q 1809)

This was January or February 497. We think that Datiya is none other than Datis, the general who led the European expedition in 490. No doubt Darius had ordered him to make an inspection tour of Asia Minor at the outbreak of the Ionian revolt and to return quickly to Persepolis and report, using the express service.

Orders could reach their destination even more quickly if aural or visual signals were used. The existence of the former is attested in a text from the beginning of the Hellenistic period that shows the operation of a chain of signals between Susiana and Fars; the text gives us every reason to believe that the use of signals goes back to the Achaemenid period. Then on the embankment of the Pasitigris, Eumenes, one of Alexander's successors, needed to summon reinforcements from Persia; by road, a troop of infantry would take about 24 days to complete the march. To shorten the delay, Eumenes resorted to a procedure described thus by Diodorus (XIX.17.6–7):

Although some of the Persians were distant a thirty days' journey, they all received the order on that very day, thanks to the skilful arrangement of the posts of the guard (*phylakai*), a matter that it is not well to pass over in silence. Persia is cut by many narrow valleys and has many lookout posts (*skōpai*) that are high and close together, on which those of the inhabitants who had the loudest voices had been stationed. Since these posts were separated from each other by the distance at which a man's voice can be heard, those who received the order passed it on in the same way to the next, and then these in turn to others until the message had been delivered at the border of the satrapy.

In the most urgent cases, the acoustic message was the only one that could surmount a natural obstacle, such as a river. When Darius reached the north bank of the Danube on his retreat, he had to alert the Ionian leaders, who with their boats were on the opposite shore; for this purpose, Darius called on an Egyptian "with a tremendous voice," who was able to transmit the order to rebuild the pontoon bridge (Herodotus IV.141♦). A Persian, Artachaeus, was reputed to have "the loudest voice in the world" (VII.117♦), and Persian youths were trained "in loud speaking and in breathing, and in the use of their lungs" (Strabo XV.3.18♦).

Visual relays, using fires kindled gradually, are also reported. This technique—called *pyrseia* by the Greeks—was well known in Judah in the sixth century and in the kingdom of Mari from the beginning of the second millennium on. It developed considerably in fourth-century Greece, as Polybius indicates (X.43–47): "Things that are about to happen can be brought to the attention of those to whom it is important to be kept up to date, whether it be three or four days away or even more." It was commonly used in the Persian Empire as well. It was, for example, "by a chain of beacons through the islands" that Mardonius, left in Greece after Salamis, intended to transmit to Xerxes, then in Sardis, news of the striking victory he (imprudently) expected to win over the Greeks (Herodotus IX.3♦). Aeschylus also alludes to this technique quite clearly in *Agamemnon*: the king let Clytemnestra know of the fall of Troy by fires lit from mountaintop to mountaintop. The entire system of visual relays was restored by one of Alexander's successors, the *Diadoche* Antigonus the One-Eyed, as Diodorus says (XIX.57.5♦): "He himself established at intervals throughout all that part of Asia of which he was master a system of fire-signals and dispatch-carriers, by means of which he expected to have quick service in all his business." The existence of such a system in Ptolemaic Egypt probably also resulted from the Persian heritage.

Lines of Communication and Strategy

From the point of view of Achaemenid power, the great axes of communication and traffic above all fulfilled a political and strategic function. The king's highways were "military roads," to repeat a phrase used by Quintus Curtius (V.8.5). In case of general mobilization, they enabled the various contingents to reach the assembly points that had

been established for them (e.g., Herodotus VII.26). It fell to the satraps to construct depots, such as those described briefly by Xenophon in the *Anabasis*, on the Royal Road along the east bank of the Tigris: "Flour, wine, barley accumulated in great quantity for the horses. All this was put in reserve by the satrap of the country" (III.4.31). It was also for strategic reasons that the administration took measures to guarantee a supply of water. The necessity for these provisions is exemplified by a story from southern Palestine, where during the march to Egypt in 525 Cambyses had to resort to the services of the king of the Arabs, who replenished the Persian army's water supply (using a method that irresistibly calls to mind an episode from Esarhaddon's expedition of 671: ANET³ 292). Later on, according to Herodotus, the Persians improved the road, providing reservoirs. It is likely for the same reason—at least in part—that the Achaemenid authority supported the digging of *qanats* at the foot of the Elburz Mountains, which ensured permanent stores of water on the main road leading from Media to Central Asia (Polybius X.28).

In case of an attack on royal territory, the lines of communication also proved a decisive factor, both for the Achaemenid general staff and for the leaders of the enemy armies. In fact, control of the main roads provided the logistics necessary for sustaining the progress of armies. For an enemy bent on penetrating the Empire, it was essential to seize these major axes in order to control supply points and access routes. The choice of secondary routes could create surprise, but it could be no more than temporary and circumstantial, since the problem of provisions would soon crop up. Evidence comes to us from Cyrus the Younger's army: as far as Corsote, it could find supplies easily enough. After that, however, the army had to cross a desert on the east bank of the Euphrates, which made it nearly impossible for the soldiers to feed themselves except by buying from the dealers who accompanied the army (Xenophon, *Anab.* I.5.7).

Whenever a vast army crossed a region, it exhausted the region's capacity for supplying it. One example of this is found in the arguments among the Greek leaders after the death of Cyrus the Younger in Babylonia:

They debated the plan for retreat and the road by which to reach the seacoast together. They agreed they could not take the same route by which they had come, because the land they had crossed was largely desert, and troops unceasingly harassed by their enemies would have lacked provisions. (Diodorus XIV.24.8)

Similarly, to those who counseled Darius III not to confront Alexander in Cilicia and to retreat to Babylonia, he replied:

There was hardly any way to carry on the war. Such a multitude, at least at the onset of winter, could not find sufficient supplies in a deserted region that had been ravaged alternately by his soldiers and by the enemy. (Quintus Curtius III.8.8).

The conditions that determined the strategy adopted by Eumenes in Babylonia in 317 were very much the same:

He [Eumenes] was forced, however, to cross the [Tigris] because the country behind him had been plundered, whereas that on the other side was untouched and able to furnish abundant food for his army. (Diodorus XIX.12.4⇨)

The same sort of reasons (in part at least) directed Darius III's choice after his defeat at Gaugamela: he reached Media, leaving Alexander to take the royal road to Babylon: "The reason he had chosen to flee to Media was that he thought that Alexander would take the road to Susa and Babylon after the battle, since its entire length crossed inhab-

ited areas, and since the road itself was not hard for the beasts of burden. . . . On the other hand, the Media road did not represent an easy march for a large army" (Arrian III.16.2).

It could thus be said that, for the enemies of the Great King to have any chance of success, they would have to take the Achaemenid theater of strategic operations or, in other words, to turn to their own advantage the logistics the Persian authority had established to ensure its survival. This is the main point of a well-known anecdote told by Plutarch: Alexander once received ambassadors from the Great King during his father's absence, and one of the questions he asked them concerned "the length of the roads and techniques for traveling in the high country" (Plutarch, *Alex.* 5.2; cf. *Mor.* 342b-c). Again, when a defensive strategy was employed by the Persian authorities—or sometimes against them—roads and rivers could be transformed into obstacles in the face of invaders.

From reading Xenophon's *Anabasis*, we discover in fact that both in the Greek imagination and in their actual experiences, rivers represented the obstacles that led them to fear never being able to return to the sea. One of their leaders, Clearchus, addressed the satrap Tissaphernes in terms that make it perfectly clear that he found himself completely unable to master Achaemenid strategy, whether routes, replenishments, or rivers:

With you, every way is easy, every river is crossable, and there is no dearth of provisions; without you, every way is plunged into darkness, since we know nothing of our route, every river is difficult to cross, every mob is terrifying. (II.5.9)

Tissaphernes uses the opportunity to stress ominously in reply:

The rivers are so numerous that on their banks we are free to pick those of you we choose to fight, and there are some that you could not possibly cross unless we ourselves brought you over. (II.5.18).

This was especially true in Babylonia, where access to the great capitals was contingent on crossing rivers and canals. In wartime, the controlling power could choose to use rivers and canals as means of defense. This was a strategy that was applied from earliest times down to the present—before, during, and after Achaemenid dominion. One example stands out above many others: during the battles of the *Diadochoi* in Babylonia, Seleucus and his side, in order to block their adversaries, "sailed off to a certain ancient canal and cleared its intake, which had been filled up in the course of time. Since the Macedonian camp was surrounded by water and the neighbouring land on all sides was now inundated, there was danger that the entire encamped army would be destroyed by the flood" (Diodorus XIX.13.2 \diamond). It is thus easy to understand the fear expressed by Clearchus, head of the Greek mercenaries, after the death of Cyrus the Younger:

They kept coming upon trenches and canals, full of water. . . . Clearchus . . . suspected that the trenches were not always full of water in this way, for it was not a proper time to be irrigating the plain; his suspicion was, then, that the King had let the water into the plain just in order that the Greeks might have before their eyes at the very start many things to make them fearful of the journey. (Xenophon, *Anab.* II.3.10–13 \diamond)

The Persians took these considerations into account when Greek mercenaries found refuge in a region encircled by the Tigris and by canals; they feared that

the Greeks might destroy the bridge and establish themselves permanently on the island, with the Tigris for a defence on one side and the canal on the other; in that case, they

thought, the Greeks might get provisions from the territory between the river and the canal, since it was extensive and fertile and there were men in it to cultivate it; and furthermore, the spot might also become a place of refuge for anyone who might desire to do harm to the King (II.4.22 [Loeb]).

To be sure, a river did not constitute an absolutely impassable obstacle for a determined army. Sometimes it could be forded. This, for instance, is how the Macedonians crossed the Tigris in 331, albeit not without some fears:

Negotiating the ford, they were in fact in water up to the chest and the rapidity of the current unbalanced many soldiers while they were crossing, making them lose their footing. Many others were carried off by the current which, pounding against their shields, threw them into the gravest dangers. But Alexander thought of an expedient to fight against the violence of the current; he ordered all the soldiers to hold each other firmly by the hand and form a sort of weir by squeezing against each other. The Macedonians did not escape this bold crossing unscathed. (Diodorus XVII.56.3–5)

They could also gamble on luck: collecting all available boats or even crossing on inflated or stuffed animal skins—a procedure widely used in the ancient Near East. Cyrus's Greek mercenaries crossed a Babylonian river on a raft of animal skins to acquire supplies (Xenophon, *Anab.* I.5.10). This is also how Darius I's soldiers crossed the Tigris on their expedition against Nidintu-Bēl in 522 (DB §18). And it was also the method Alexander used to cross the Oxus River, when Bessus had burned all the boats after reaching the east bank:

And the lack of wood was a special source of worry, and it was obvious that they would lose a lot of time if they had to go on distant searches for all the materials needed for building a bridge across the river. Under these conditions, Alexander had the skins collected with which the soldiers covered their tents and ordered them filled with very dry straw and sewn together with tight stitches so that the water could not enter. Thus stuffed and stitched, they enabled the army to cross in five days. (Arrian III.29.4)

A similar technique was suggested by a Rhodian to the survivors of the Ten Thousand, who were anxious to cross the Upper Tigris:

I will need, he said, 2,000 skins; indeed, I see on every side sheep, goats, oxen, donkeys: slaughter these animals, inflate the skins; we will be able to cross easily. I will also need the straps you use for the harnesses. With these straps I will connect the skins in pairs, I will attach each one to the bottom by hanging rocks from them that will be dropped into the water as anchors. Then, when I have lined them up across, I will attach them to both banks, and over them I will throw bundles of wood on which I will put earth. You will not sink, as you will soon see: every skin can bear two men. And the sticks and soil will keep you from slipping. (III.5.9–11)

The Gates of the Empire and the Network of Garrisons

Guardposts (*phylaktēria*) scattered in strategic locations were another feature of the Persian system of control. In his description of the Sardis–Susā road, Herodotus mentions one guardpost on the Halys, two in Cappadocia, and one in Armenia (V.52). In addition to these posts, there were others that the ancient authors called Gates (similar to the Thermopylae in Greece). Coming from the west (Asia Minor), the first of these, the Cilician Gates, controlled the northern entry to the Cilician plain. They are described by Diodorus, Xenophon, and the historians of Alexander's campaigns: "It is a very narrow, sheer passage, 20 stadia long [ca. 3.6 km]; on both sides, mountains of giddy height,

whose walls extend to the edge of the roadway. . . . The road that leads there, wide enough for chariots (*hamaxitos*), was very steep and inaccessible to an army, however slight the resistance it encountered" (Xenophon, *Anab.* I.2.21). These "narrow gorges" were what the natives called Gates, "since the natural site imitates the fortifications built by our hands" (Quintus Curtius III.4.2). It was thus in principle possible for a single garrison to control access. In 401, Cilician soldiers were guarding the pass; Cyrus sent a small unit by a back road to take it from the rear; upon finding out, the Cilician troops deserted their post, which allowed Cyrus to descend to the plain (*Anab.* I.2.21–22). In 333, Alexander attacked the Gates with light troops, who took the unguarded heights (Arrian II.4.3–4); that the heights were left unguarded was severely criticized by Quintus Curtius, for "the satrap should have been able, without risk to his own side, to contain or wipe out an enemy that normally would have dominated him. . . . Alexander recognized that mere rocks would have squashed him, if there had been people to drop them onto his army below. Four men could barely pass abreast" (III.4.4, 11–12).

Once an attacker had arrived in Cilicia, other Gates awaited him beyond Issus, which Xenophon calls the Cilician Gates and the Syrian Gates (pass of the Portelle):

They consisted of two walls; the one on the hither, or Cilician, side was held by Syennesis and a garrison of Cilicians, while the one on the farther, the Syrian, side was reported to be guarded by a garrison of the King's troops. And in the space between these walls flows a river named the Carsus, a plethrum [30 m] in width. The entire distance from one wall to the other was three stadia [ca. 550 m]; and it was not possible to effect a passage by force, for the pass was narrow, the walls reached down to the sea, and above the pass were precipitous rocks, while, besides, there were towers upon both the walls. It was because of this pass that Cyrus had sent for the fleet, in order that he might disembark hoplites between and beyond the walls and thus overpower the enemy if they should be keeping guard at the Syrian Gates. (*Anab.* I.4.4–5♦)

The entrance to Persia was also defended by several garrisons. A first gate was located near Fahliyun. This was a true stronghold, held in 331 by Madates, a relative of the Great King, "who had decided to risk all for the sake of his honor" (Quintus Curtius V.3.4). With the help of local guides, a small Macedonian detachment used a mountain road and occupied a position overlooking the citadel. Once this position fell, the main road to Persepolis lay open. Alexander sent the bulk of the army, which took the wheelworthy (*hamaxitos*) road across the plain (*iter campestre*) toward Persepolis. Alexander himself, with light troops, used the mountain road in order to be able to take the Persian Gates, where the satrap Ariobarzanes had amassed several thousand men and had built a cross-wall to prevent Alexander's passage. Also worth mentioning are the Caspian Gates (the passes of Sialek and Sardar), located about ten days' march east of Rhagae in Media, which Alexander crossed in 330 in pursuit of Darius.

The strategic value of such transit points is clear. Herodotus notes, for example, that in front of the entrance to the bridge over the Halys—guarded by a fort (*phylaktērion*)—were gates "which have to be passed before one crosses the river" (V.52♦). The relatively small number of permanent pontoon bridges forced caravans to follow the routes laid down by the royal administration. This permitted the administration to easily control the traffic. We must also stress the importance of the location of Thapsacus, where pontoon bridges provided a crossing of the Euphrates River on the main route connecting Babylonia and the Mediterranean coast. Xenophon called Thapsacus a "populous,

large, and rich city" (I.4.11). Its exact location remains in dispute, but it must have been near ancient Carchemish, a crossroads city well known from earlier periods. There is no doubt in any case that it was zealously guarded by the Persians. As it happens, an Achaemenid-period cemetery has been found at Deve Hüyük, 27 km southwest of Carchemish, dated to the first half of the fifth century. The objects discovered (arms, horse bits, etc.) show that a fairly sizable garrison existed there, in all probability to guard the crossings and fords of the Euphrates.

At the same time, we need to be subtle in our interpretation of this picture, recalling that our only information on the gates and bridges comes from military reports written by victorious aggressors. These natural fortifications were not impregnable. In every case, they could be circumvented via footpaths pointed out by local peasants and herdsmen — exactly the way that Thermopylae fell into the hands of the Persians in 480. The gates were lightly manned, except for the special case of the Persian Gates in 331, and these were located on a secondary route used by people going from Susa to Persepolis. In the mind of the Persian leaders, the job of the gates was not to halt an enemy offensive, something that was scarcely conceivable anyway. When these gates were properly garrisoned (which was not a permanent condition), they were part of a very dense network of fortified positions that allowed the Persians to hold the level ground and the roads that connected them. These garrisons were in permanent contact through the system of acoustic messages described by Diodorus in connection with the Persian fortifications (*phylakai*) and through visual messages, such as those seen in operation in Mysia at the end of the fifth century, in the Caicus Valley (Xenophon, *Anab.* VII.8.15).

The King's Service

All of these texts, to which many others could be added, have the value of giving — "in a nutshell," we might say — information on the measures taken in peacetime. At first glance, study of the mail and the royal roads confirms the viewpoint of the Greek observers. The main roads constituted one of the methods of territorial control and maintenance of order. Their primary function was political and military: they were used by couriers, armies, tribute-bearers, and also by troops of government workers (the *kurtas* of the Persepolis tablets; see chap. 11 below) when they were moved from one spot to another. The garrisons placed along them were integrated into a very dense network of fortified locations that organized and structured the territories.

Even when it is stripped of its ideological gloss, the documentation generally testifies to what might be called the political organization of the territory, operated in such a way that the vastness of the Empire did not threaten its survival. Indeed, the moment the Persian presence began to weaken, the roads became less secure. This fact is well illustrated by a passage in the *Life of Datames* (4.1–2): C. Nepos records that in the 370s the satrap Datames was sent to battle the dynast Aspis, who in open rebellion against the Great King controlled Cataonia, a region "full of small strongholds . . . on the frontiers of Cilicia and Cappadocia: if any tribute was being brought to the Great King, they stole it!"

In this respect, then, Herodotus and Xenophon were not at all wrong to stress the political purpose of the Achaemenid mail service. To Greek eyes, the presence and activity of the Achaemenid couriers represented and symbolized the territorial dominion exercised by the Great King. As Plutarch puts it (*Cimon* 19.4), the absence of messengers (*grammatophoroi*) and royal tribute-collectors (*phorologoi*) in a region indicated that it had escaped the dominion of the central authority. In this regard, the Greek texts also

express the Persian ideology of dominion. The round-the-clock traffic of messengers immediately brings to mind Darius's boastful proclamation: "These [subject] peoples did what I ordered them, night and day" (DB §7)! It is also the picture drawn by the author of the *De Mundo*: "So perfect was the organization and especially the system of visual signals, whose fires succeeded each other from the ends of the Empire to Susa and Ecbatana, that the Great King knew the very same day whatever was happening in Asia" (398a). But this picture gives only imperfect expression to an infinitely more complex reality: it communicates both the Greek fascination with a State that had succeeded in uniting vast territories and a highly idealized vision of the imperial realm, particularly as it emerges from the royal inscriptions (cf. chap. 5).

3. Lines of Communication and Trade

Commercial Arteries?

It is usually supposed that the main royal roads were regularly used by caravans transporting merchandise. The problem is that none of the Persepolis tablets and no Classical texts ever refer to merchants. The only references to long-distance transport are found in political contexts, either tribute or materials gathered at Susa for the construction of Darius's palace. It would perhaps be risky to draw firm conclusions from silence. It is extremely unusual when the tablets themselves give any indication of the purposes of the trips they authorize. We know perfectly well, without (obviously) being able to find any trace in the Persepolis tablets, that the Babylonian firms did business in Elam, Persia, and Media. Moreover, the Classical sources themselves rarely report anything other than the travels of ambassadors or the progress of armies, and they give hardly any information at all on the entire eastern half of the Empire, namely the Iranian Plateau and Central Asia. Indeed, there is every reason to assume that long-distance trade, which is well attested from earlier periods, continued in Achaemenid times. Unfortunately, textual attestations do not exist, apart from a fleeting reference in Ctesias (*Indica* §2) to a Bactrian merchant in India.

By way of indirect evidence, we may turn to Xenophon's *Anabasis*. Cyrus the Younger's route to Babylon was parceled out in stages set up in towns that Xenophon describes very obliquely using modifiers like "populous town" (*polis oikoumenē*; Peltae, Ceramon-agera, Caÿstru-pedion, Thymbrium, Tyraeum), "populous, rich, and great town" (*oikoumenē, eudaimōn, megalē*; Colossae, Celaenae, Dana, Issus, Thapsacus), "great and rich" (Tarsus, Charmande, Caenae), "large" (Opis), or "large and very populous" (Sittacus). On the other hand, Corsote is "a large abandoned town" and Mespila (once the capital of Assyria) is "a large deserted town." The use of such vocabulary—however stereotyped—necessarily takes on a descriptive function in Xenophon's mind. It may be that, for a Greek, the word *oikoumenē* described a town that preserved a certain degree of autonomy—that is, it existed as a city (in the Greek sense). Some of them, in addition, were capitals: Celaenae, capital of the satrapy of Greater Phrygia, site of an immense paradise (where Cyrus organized a review of his troops) as well as a fortified palace built by Xerxes; similarly, Tarsus, where "the palace of the *syennēsis* (Cilician dynast) was found." But the adjectives that are organically included in a number of cases—"rich" in particular—clearly refer to an economic fact as well. These towns were rich, first of all, because soldiers could stay there several days and find supplies; a market (*agera*) might also be held there, which would allow the soldiers to escape the clutches

of the traveling merchants that followed the army. Some of them are explicitly called commercial towns—primarily the coastal towns, such as those in Cilicia. Tarsus was abandoned by its natives but not by “those involved in retail trade (*kapēlia*) or by those who lived on the seacoast, at Soli and Issus” (Xenophon, *Anab.* 1.2.24; Issus is where Cyrus joined up with the ships that had cast off from Ephesus). Likewise, Myriandus—“a town inhabited by Phoenicians”—is called “an *emporion*, where a large number of merchant ships were anchored” (1.4.6). Indeed, these references remain vague. However, considering Thapsacus’s position in trade between the Mediterranean coast and Babylonia, it seems appropriate to conclude that, if this town was “populous, great, and rich,” it may well have been because it was frequented by merchant caravans. We may also note that the activities of Babylonian merchants are attested in Syria in cuneiform documents from Darius’s time. And there can be little doubt that North Arabia was crossed by camel caravans, not just between Arabia Felix and the Palestinian coastal ports (Gaza) that Herodotus calls *emporía* (III.5), but also between the Nile Delta and the Euphrates.

Land Routes and Water Routes

The Classical authors, so loquacious in their admiration of the Achaemenid road and postal system, are rather tight-lipped about communication along rivers and seas. The reason is doubtless to be sought in the strictly military orientation of the available sources, which took rivers and canals far more often as obstacles than as communication arteries. In reality, however, rivers, seas, and canals constituted axes of penetration that were often quicker and more efficient than land routes, especially for transporting heavy items.

First of all, coastal regions are very often rocky and/or marshy, so much so that coastal roads are either nonexistent or else so difficult to access all or part of the year that coastal navigation is an obvious solution. Many historic episodes in Asia Minor testify to this. In 396–395, the Spartan Agesilaus, then in Paphlagonia, negotiated a marriage between the dynast Otys and the daughter of the Persian nobleman Spithridates. She was then living in Cyzicus, a port on the Sea of Marmora. It was impossible to bring the princess by land before spring, because of the cold and snow. Otys, who was in a hurry, pointed out that if they wished they could bring her rapidly by sea: “Immediately Agesilaus fitted out a trireme and ordered the Lacedaemonians to fetch the girl” (Xenophon, *Hell.* IV.1.4–15). The same sort of arguments were put forward by Hecatonymus, a Sinopean, when he tried to persuade Xenophon’s soldiers to go by sea to Cotyora in Sinope and then to Heraclea by the Black Sea. He assured his listeners that, if they did not follow his advice, they would encounter obstacles natural (rivers) and human (Paphlagonians) that would sooner or later block their progress, since the land route was “absolutely impossible.” “On the other hand,” he promised, “if you go by sea, from this country you can hug the coast as far as Sinope, and from Sinope to Heraclea. From Heraclea you can go just as easily by land as by sea, since in this city plenty of boats are available” (*Anab.* V.6.10). Similarly, to bypass the the Cilician and Syrian Gates, whose fortifications reached to the water’s edge, Cyrus the Younger relied primarily on his marines: “He wanted to land some hoplites between the two Gates and beyond the second, to surprise and overcome them, if the enemy was guarding the Gates of Syria” (1.4.5). In the same way, Alexander sent his spies by sea to report on Darius III’s troop positions on the Plain of Issus in Cilicia (Arrian II.7.1). For rapid connections between Cilicia and the western

coast of Asia Minor, it was much more efficient to go by sea. For instance, when Mardonius was entrusted with an expedition to Europe, after he had arrived in Cilicia, "he took ship and continued along the coast in company with the fleet, leaving other officers to conduct the troops to the Hellespont" (Herodotus VI.43◊). Coming from the other direction, Issus is where Cyrus the Younger, having taken the land route, joined up with his fleet, which had set sail from Ephesus.

To get heavy goods out of the back country, there was scarcely any other alternative than using the coastal rivers and hugging the shore until reaching the mouth of another river. Many Greek cities in Asia Minor struck coins showing a river god, often holding a bow, a stern, or a rudder. In northern Asia Minor, the Hypius, Rhyndacus, Lycus, Sangarius, Iris, and Halys rivers were navigable; these were the routes for shipping out the timber cut along their upper reaches. The same was true for the Eurymedon River in southern Asia Minor. Of course, land transport of heavy goods was not unknown in the Near East, as in, for example, king Assurbanipal's account of his Egyptian campaign and the booty that resulted. He says that he transported two enormous obelisks from Thebes in Egypt to Assyria (*ANET*³ 295). But only powerful states had the ability to mobilize a labor force both large enough and specialized enough to accomplish such a move. In an example from a later time, Antigonus the One-Eyed made gigantic preparations for an expedition against Egypt in 312. Established at Tyre, he sought the aid of the Phoenician kings: "He himself collected wood cutters, sawyers, and shipwrights from all sides, and carried wood to the sea from Lebanon. There were eight thousand men employed in cutting and sawing the timber and one thousand pair of draught animals in transporting it" (Diodorus XIX.58.2◊). After arriving at the coast, the wood had to be transported by sea to its destination. When Solomon requested lumber from King Hiram of Tyre, he replied that the wood would be conveyed in the form of rafts from Tyre as far as Joppa; it is likely that the same was done with the wood offered by Cyrus for the reconstruction of the temple in Jerusalem. On the Syro-Palestinian coast, several small coastal rivers were also accessible to cargo ships.

The Euphrates Boats

Rivers and canals held a special place in the social and economic life of Babylonia. Except in its upper reaches, which were cut off by rapids, the Euphrates was navigable, as was one of its tributaries, the Khabur. Many cuneiform texts attest to the importance of trade in heavy products (grain, bitumen, wood, stone, etc.) throughout the second and first millennia. Herodotus also took a lively interest in Euphrates navigation. In particular, he gives a fairly precise description of the boats in use in his day:

I will next describe the thing which surprised me most of all in this country, after Babylon itself: I mean the boats which ply down the Euphrates to the city. These boats are circular in shape and made of hide; they build them in Armenia to the northward of Assyria, where they cut ribs of osiers to make the frames and then stretch watertight skins taut on the under side for the body of the craft; they are not fined-off or tapered in any way at bow or stern, but quite round like a shield. The men fill them with straw . . . and let the current take them downstream. They are controlled by two men; each has a paddle which he works standing up, one in front drawing his paddle towards him, the other behind giving it a backward thrust. The boats vary a great deal in size; some are very big, the biggest of all having a capacity of some hundred and thirty tons [5000 talents]. Every boat carries a live donkey—the larger ones several—and when they reach Babylon and the cargoes have been offered for

sale, the boats are broken up, the frames and straw sold and the hides loaded on the donkeys' backs for the return journey overland to Armenia. It is quite impossible to paddle the boats upstream because of the strength of the current, and that is why they are constructed of hide instead of wood. Back in Armenia with their donkeys, the men build another lot of boats to the same design. (I.194◊).

Herodotus seems to have confused two kinds of small craft well known in both ancient and modern Mesopotamia: the *kelek*, a raft constructed on a series of inflated skins, described several times by Xenophon in the *Anabasis*; and the *quffa* (Akkadian *quppu*), which is a type of round boat covered with leather. Only the *kelek* can navigate the rapids of the Euphrates. Not all of the boats were built to this pattern. This is shown, for example, by a Neo-Babylonian-period tablet from the archives of the Eanna at Uruk: it states that 5 minas of silver are allotted for the wood for 22 boats that were to transport 30,000 measures of asphalt. The text states that the work squad includes, in addition to unspecialized laborers, a blacksmith, two builders, and four boat carpenters; the latter are a special type of carpenter, distinguished for instance from "door carpenters."

In the Babylonian towns, all economic activity depended closely on numerous waterways, which were often a network of great complexity. They guaranteed the irrigation of the fields and the supply of drinking water as much as the transport of heavy objects. This is documented, for example, in the archives of the Eanna of Uruk. When the temple administrators bought bitumen and asphalt, these materials were transported by boat. The waterways were also used to convey both grain and date harvests to the city quays. The collection centers throughout the year were located on the shores of the navigable routes: "along the high waters," to use the Babylonian expression that referred to canals that were navigable year round. It was the same in Babylon, where materials for the large temple downtown were offloaded at the "Quay of Bēl." Most of the sixty canals near Nippur were navigable. At Uruk, there were flotillas that belonged either to the Eanna or, more often, to professional boatmen who worked for the temple, taking in a fairly high fee for boat and crew rental. Sometimes, peasants and soldiers were required for hauling boats. This could require quite a few craft; on one occasion, for example, we read of the crop-watcher of the Eanna, who needed to transport the barley harvest and contacted a flotilla of 300 small boats, which were immediately placed at his disposal. At Nippur, service lands were granted in concession to the "commander of the boatmen."

Transport on the Tigris

In its upper course, the Tigris River was accessible to large transport ships as far as north of the Nineveh area. The Assyrian kings often used the river to float building timber and enormous sculptures for their palaces. Sennacherib built a fleet at Nineveh; it sailed down the Tigris to Opis, where the boats were transferred to the Euphrates by a canal. In the Achaemenid period, the use of the Tigris is confirmed by Darius III's plans in 332–331. He had decided to concentrate his immense forces in the upper valley of the Tigris at Arbela, a major town on the road connecting Babylon to the West: "He would receive his supplies either by land or by the Tigris" (Quintus Curtius IV.9.8), he thought. The east bank of the Tigris was in fact edged by the king's highway described by Herodotus and taken by the Ten Thousand on their return northward. During this march the soldiers passed near the town of Opis, where there was a bridge; there can be no doubt that Opis was a river port of prime importance. In 539, Cyrus crossed the Tigris

and achieved a decisive victory over the Babylonian armies. Xenophon calls it a "considerable city" (II.4.25) and describes the traffic he saw all around: "There are canals that branch off the Tigris. There are four of them. They are a plethra [approximately 30 m] wide and very deep. Boats filled with wheat travel them" (I.7.15). Tablets from the reign of Cyrus also indicate that the town contained a bustling market, where representatives of the House of Egibi went to buy and sell slaves.

From Babylonia to Elam

Navigation was not restricted to the great north-south routes represented by the Euphrates and the Tigris. The two rivers and their tributaries were linked by many canals, which especially facilitated trade between two extremely important Achaemenid centers, Babylonia and Elam (Susiana). Beyond the transverse canals, the Persian Gulf represented a means for privileged communication. This was already evident in the strategic measures adopted as far back as the Assyrian king Sennacherib: desiring to attack Elam from Babylon, he ordered his fleet to descend the Euphrates, skirt the coast of the Persian Gulf, and then land at the mouth of the Karun, on whose banks a decisive land battle was fought. It is likely that the return up the Euphrates was aided by the powerful tides, which at that time reached as far as Uruk.

The comings and goings of the Macedonian fleets in 324 are also informative. After their meeting in Carmania, Nearchus, commander of the fleet, and Alexander agreed to rendezvous at Susa. Guided by a Persian pilot, Nearchus sailed up the Pasitigris (Karun) as far as Ahwaz, then took the Eulaios up to Susa. The next year, Alexander in turn, leaving Susa, went down the Eulaios and reached the mouth of the Tigris; while another part of the fleet went back up the Eulaios as far as the junction with the canal linking the Eulaios with the Tigris and finally entered the Tigris. And Nearchus, who by then had reached the mouth of the Euphrates, met up with Alexander by once more taking the Eulaios. The hazards of navigation—emphasized as early as Sennacherib—made the use of professional pilots obligatory. This is what Nearchus had to say, speaking about the northern section of the Persian coast of the Gulf: "Along the Persian coast, the route was nothing but shoals, reefs, and lagoons" (*Ind.* 38.8). The Susiana coast was similar: "The sea has little depth overall, the reefs extend far from the shores, and it is difficult to enter the ports" (40.10).

Several Babylonian tablets attest to the regularity and vigor of trade. In 505, six men received payment in kind (wool) to take a boat loaded with barley to Elam. In 499, two Babylonians received a fee for taking a boat carrying garments to Elam. The House of Egibi, the commercial company, had agents on the spot. A text from the time of Nabonidus attests that, upon their return, the Babylonian boats brought "fruits of the Elamite orchards" to Babylonia. This document reminds us of what Diodorus Siculus wrote later (XVII.77.4). Speaking of "all kinds of fruit" yielded by the Uxian country (a region of Fahliyun), he wrote: "Because they dry the harvest after it is ripe, the merchants who sail the [Pasi]tigris [Karun] are able to bring down a variety of dishes to Babylonia that are a delight to their customers."

From the Mediterranean to Babylonia

In a letter attributed to him (*Letter* 30), Themistocles describes a trip that took him on an official mission from the coasts of Asia Minor to Babylon and/or Susa:

During the march, I crossed a hilly country and a deep valley. I saw and passed through deep valleys, whose slopes were inhabited and cultivated. The uninhabited portions sheltered wild beasts and herds of other animals. I navigated many rivers and visited many peoples.

Along with other information, the text explicitly refers to the use of both land and river routes, especially for travelers from Asia Minor to Babylon. Babylonian rivers and canals were closely connected to the Mediterranean coast, because of the combination of three types of transport: river, land, and sea. The source of the Euphrates is no more than about 180 km from the Gulf of Alexandretta [in modern Turkey], with which trade was always active. This is probably what Herodotus was thinking of when he described the cargo of the Babylonian boats as “mostly [Phoenician] wine in palm-wood casks”; he also refers to “anyone today who travels from the Mediterranean to Babylon and comes down the Euphrates” (I.185,♦ 194♦). Merchandise offloaded in Phoenician ports arrived at Thapsacus by land, then went down the Euphrates to Babylon. Regular use of these routes must have been considered normal, considering that the Athenian admiral Conon, who was in Cyprus at one point and wanted to meet the king [Artaxerxes II] as soon as possible, sailed for Cilicia, traveled to Thapsacus overland, and “descended the Euphrates to Babylon” (Diodorus XIV.81.4).

In 324, Alexander had a fleet of 45 ships built in Phoenicia. “These ships were taken in pieces to the Euphrates at the city of Thapsacus, where they were reassembled and went down the river to Babylon . . . where the king had a harbor dug able to receive 1000 warships, as well as arsenals for this harbor” (Arrian VII.20.2–4). From the Achaemenid period proper, we can quote a passage from the Foundation Charter of Darius’s palace at Susa: “The wood used here was brought from a mountain called Lebanon. The people from across the river (*Ebir-nāri*) brought it to Babylon; from Babylon, the Carians and Ionians brought it to Susa” (DSf §3g). The Lebanese lumber had thus been transported along the route just described: by land, then by river, interspersed with the segment by sea through the Persian Gulf. The Ionians to which this inscription refers may have been the Milesians who were punished as follows after the Ionian revolt (492): “The men [Milesians] in the city who were captured alive were sent as prisoners to Susa; Darius did them no harm, and settled them in Ampe on the Persian Gulf, near the mouth of the Tigris” (Herodotus VI.20♦). This city of Ampe might be identified with Aginis, an important trading post that Arrian locates near the mouth of the Tigris.

Writing in the Roman period, the geographer Strabo cited a third-hand report of an Athenian ambassador, Diotimus, who led an embassy to Susa in 437–436. His story was recorded by his contemporary Damastes, then became known to Strabo by way of Eratosthenes. Strabo intended to demonstrate the unreliability of the information transmitted by Damastes. He polemicized against him in these words:

Eratosthenes gives us an example of Damastes’ stupidity, because he says that the Arabian Gulf is a lake and that Diotimus, son of Strombichos, leading a delegation of Athenians, traveled by water from the Kydnos in Cilicia as far as the River Choaspes that flows past Susa, and that he arrived in Susa in 40 days and that these things had been told him by Damastes himself. (I.3.1)

How, then, can we believe that a water voyage from Cilicia to Susa was possible? Eratosthenes himself and Strabo obviously considered Damastes’ assertions to be nonsense pure and simple, and Strabo passed them on simply to show that his colleague was not to be believed. The text has sometimes been understood in the following way: having

traveled by sea from Athens to Cilicia, the Athenian ships would then have continued to the Nile Delta, taken the canal from the Nile to the Red Sea, and then retraced the path of the fleet sent by Darius from Egypt to the Persian Gulf (cf. chap. 12/1 below). However, it is far simpler to think that the Athenians followed the traditional route, landing in Cilicia, reaching the Euphrates overland, and sailing from Thapsacus, then reaching lower Babylonia; from there it was possible to reach Susa by an uninterrupted water passage, as we have already seen.

The Phoenician ports played a major role in this whole arrangement, even though their role is not well attested in the High Achaemenid period. Sidon is where Athenian ambassadors docked in the 360s before traveling on to the king, thanks to the assistance the Sidonian king Straton had given them (Tod, no. 139). Sidon is where Democedes left for Greece on Darius's orders (Herodotus III.136). Diodorus (XVI.41.4) says that, toward the middle of the fourth century, Sidon prospered greatly from commerce (*diá tes emporias*). No less important was a site such as Myriandrus, in the Gulf of Alexandretta. Here is how Xenophon describes it at the end of the fifth century (*Anab.* I.4.5): "A city inhabited by the Phoenicians on the seacoast, it was a trading post (*emporion*) where a large number of merchant ships were anchored." Myriandrus's site was in fact exceptional: "It is located where two economically important roads met: the road that links the Gulf of Issus to the Euphrates via the Gates of the Amanus and the road that links Syria to coastal Cilicia via the Cilician Gates; it was a commercial nerve-center" (G. Kestemont). In a military context, Diodorus also attests to the importance of the traffic between Cilicia and Cyprus in the 380s (XV.3.1).

Archaeology brings regional or interregional commerce to light, much more so than long- or middle-distance trade. The most interesting documents come from shortly before Cyrus's conquest of Babylon. In them we see that Babylonian storekeepers, sometimes on commission from the Eanna of Uruk, imported a number of products from Ebir Nāri, including iron and copper from Yamana (Cyprus?), iron from Lebanon, alum and "Egyptian blue" from Egypt, as well as foodstuffs (honey, wine, spices) and textiles. It seems clear that the Phoenician merchants served as middlemen between the Mediterranean West and the Babylonian merchants in this era. There is no reason to think it was any different in the Achaemenid period.

The Inland Waterways of Egypt:

The Nile between the Mediterranean and the Red Sea?

Herodotus, who was so fascinated by Euphrates boats, also discusses Egyptian boats, whose materials and method of construction he describes. He calls them *baris* and states that "some of them [are] of many tons' carrying capacity" (II.96♦); Herodotus's description has often been compared with an Aramaic papyrus dealing with the repair of a boat belonging to the Persian administration (*DAE* 61 [AP 26]). Herodotus makes certain to include pilots among the seven Egyptian hereditary classes (II.164). The Egyptian expression "to be boatless," for that matter, refers to a condition of absolute poverty. As we know, the Nile has always been the essential artery of Egyptian navigation. Diodorus follows Herodotus (II.108) in attributing the most important labors in this area to the pharaoh he calls Sesosis [Sesostris]:

Over the entire land from Memphis to the sea he dug frequent canals leading from the river, his purpose being that the people might carry out the harvesting of their crops quickly and

easily, and that, through the constant intercourse of the peasants with one another, every district might enjoy both an easy livelihood and a great abundance of all things which minister to man's enjoyment. The greatest result of this work, however, was that he made the country secure and difficult of access against attacks by enemies; for practically all the best part of Egypt, which before this time had been easy of passage for horses and carts, has from that time on been very difficult for an enemy to invade by reason of the great number of canals leading from the river. (I.57♦)

We will see how the independent pharaohs of the fourth century used this system to bar the Achaemenid armies access to the Delta road (chap. 15/9 below). The role of the Egyptian inland waterways is well attested in the Aramaic papyri, especially in supplying the Elephantine garrison (DAE 54–55 [AP 2, 24]) but also in mail delivery (DAE 14, 17 [Padua 1, AP 42] and commercial trade (DAE 26, 109 [LH 2, Berlin 23000]) between Upper and Lower Egypt.

Herodotus (II.99) stresses that the Persians carefully maintained dikes and canals in Egypt, especially to avoid the risk of flooding Memphis. Linked directly to the Nile by a canal, the port of Memphis was extremely busy. It housed not just the administration's military arsenal but also a commercial port, where communities of Carian, Ionian, and Phoenician merchants were located. We also know that on Darius's initiative a canal was (re)opened between the Nile and the Red Sea. The Great King's objective is a bit murky, since it now appears that, contrary to the boastful statement on one of the canal stelas (Posener no. 9), no direct, regular communications link between the Red Sea and the Persian Gulf existed during the Achaemenid period. One of the stelas discovered in the area of this canal came from Tell el-Maskhuta (Posener no. 8). Indeed, recent surveys in the area have produced very interesting results: pottery from various Greek cities of Asia Minor and the islands (Chios, Thasos, Lesbos, Samos) dating from all phases of the fifth century has been noted, as well as from Phoenician cities. Although the purpose is difficult to reconstruct with any certainty, we are led to infer that the canal facilitated the development of trade between the great commercial cities of the Aegean, the Nile Valley, and the Red Sea. Phoenician and Greek (Chios) pottery has also been found at a site (Dorginarti) between the First and Second Cataracts. Finally, a papyrus from the time of Darius I attests to the existence of trade between Elephantine and Lower Nubia (P. Loeb 1).

Customs Collection and Trade

As is so often the case, it is the reference to royal taxes that provides information regarding the products and trade on which the taxes are levied. Customs duties are attested at Opis and Babylon in the form of river tolls and bridge tolls. We learn from Pseudo-Aristotle (II.34a) that there were customs duties in Babylonia: having fallen (according to the author) into disuse in Alexander's time, "an ancient regulation (*nomos*) in force in Babylonia required the payment of 10% (*dekate*) on any product entering the country (*tōn eisagomenōn*)." The book of Ezra (4:20) implies the existence of regular customs duties throughout the Empire. There is little doubt that customs posts were established in the main stopover towns, such as Thapsacus on the Euphrates, as well as many others. Perhaps they were also established in the towns on the frontiers of satrapies, such as Cydrara, which marks the border between Lydia and Caria (Herodotus VII.30), or Iconium, which Xenophon (I.2.19) calls "the last city in Phrygia" (when coming from Celaenae).

Customs Collection on the Nile

We can garner extremely interesting information about customs collection from a very recently published Aramaic document, which the editors date to the reign of Xerxes, around 475 (TADAE C.3.7). It consists of extracts from the ledger of an Achaemenid Egyptian customs post that survives as a palimpsest beneath a famous text, the Ahiqar story (TADAE C.1.1). The extracts record the inspection, registration, and taxation of ships that entered and left Egypt. Some ships are explicitly called Ionian (*ywny*); others are not marked by any ethnic label, but, given that they were transporting merchandise probably originating in Phoenicia (wood and especially Sidonian wine), we are led to think that they were Phoenician boats (another undated Aramaic document [TADAE C3.12 (DAE 12, AP 72)] attests to the use of Sidonian wine in Egypt). It seems that both the wood and the wine came from ports (in Asia Minor in the first case, in Phoenicia in the second) whose names are given, but there remain many difficulties in identifying them with certainty (Phaselis for the Ionian ships?). Arrival and departure dates of the boats are also given, as are their technical specifications and even the names of their captains. A number of Greek names from Asia Minor are found among the Ionians, and even one apparently Iranian name (Spitaka). All this information was recorded by the royal customs administrators during inspection when the ships arrived and departed. Regardless of their origin or type, every boat was taxed upon entry according to the value of the cargo. The Ionian ships paid a tax called *mndt'*, that is, *mandattu* (an Akkadian word referring to various fiscal levies, including taxes in Achaemenid Egypt); these were duties assessed in gold or silver, to which part (*mnt*) of the cargo of (olive?) oil was added. The Phoenician boats paid 10% (*m'sr'*) of each product carried, a fact that enables us to determine the exact composition of the cargo: it included amphorae (*kd*; Greek *kados*) of wine, different kinds of wood (unfinished wood, boards, etc.), metals (bronze, iron, tin), wool, and (much more rarely) clay (Samos earth?). In addition, each boat paid another fixed tax referred to by the rather mysterious label "silver of the men." On the return trip, every boat paid the "silver of the men," and the Ionian boats paid a tax proportionate to the value of the natron they were exporting from Egypt. All of these assessments were recorded in the accounts of 'the king's house' (*byt mlk'*), that is, the royal administration.

The name of the place where assessments took place is not given. One naturally thinks of Memphis. What is striking is the continuity of the Egyptian system during the Persian period with the customs system known from the Saite period—thanks to several hieroglyphic stelae—and from the period of Egyptian independence in the fourth century known from the Naucratis stela. We know that during the time of Nectanebo I (380), the pharaoh exacted taxes (in gold, silver, or kind) on goods imported from the Mediterranean to Naucratis as well as on the produce of Naucratis itself: one-tenth of the assessment was then transferred to the Treasury of Neith at Saïs. It would not be surprising if, in his "fervor" in regard to Neith, Cambyses had reinstated such regulations. Whatever the case, the extant documents very clearly fit into a chronological and organizational continuum between the Saite period and the fourth century. Since we know that the assessment was made at the entrance to the Canopic Mouth of the Nile Delta in the fourth century, in the city of ʔEnwe (Greek Thonis), we may imagine that this was also the case during the period of Achaemenid dominion.

From the Nile to the Euphrates

The aforementioned Aramaic document, exciting in itself, becomes even more informative when we compare two Neo-Babylonian tablets that record the quantities of merchandise imported and sold on the Babylonian market a few years before Cyrus's conquest. Here is a simplified inventory (based on the groundbreaking study by A. L. Oppenheim):

YOS 6.168 (550 B.C.)		TCL 12.84 (551 B.C.)	
Copper from Yamana	600 minas	Copper from Yamana	295 minas
Dye	81 minas, 20 shekels		
Tin	37 minas	Tin	37 minas
Blue-purple wool	16 minas, 15 shekels		
Copper from Yamana	205 minas		
Lapis lazuli/"Egyptian blue"	55 minas	Lapis lazuli	55 minas
Fibers	153 minas	Fibers	153 minas
Alum from Egypt	233 minas	Alum from Egypt in sacks	233 minas
Dye	32 minas, 20 shekels		
Iron from Yamana	130 minas	Iron from Yamana	130 minas
Iron from Lebanon	257 minas	Iron from Lebanon	257 minas
Assorted honeys			
White wine	20 'jars': <i>kandamu</i>		
Dye	120 minas		
Spice	40 minas		
Spice	1 <i>kurru</i>		
Juniper resin	1 <i>kurru</i>		

Both tablets refer to the importation into Babylonia of products from the west, as certain place-names make very clear (Yamana, Lebanon, Egypt). Following a route known well to Herodotus (I.185, 194) when he wrote of the importing of Phoenician wine into Babylonia, many products imported from various Mediterranean countries were in fact transshipped in Phoenician ports and from there transported to Babylonia (pp. 382f. above). We may also note that, both in the Babylonian tablets and in our Aramaic document, the commerce was often in identical products (sometimes more easily identifiable in Akkadian): copper and iron (from Yamana), iron from Lebanon, tin, wine (and honey from various places in the tablets), and wool (dyed purple and blue). From Egypt came Egyptian blue (imitation lapis lazuli) and alum. In this regard, TCL 12.84 states: "233 minas of Egyptian alum with (its) containers (*aban gabî ša Mišir adi gurābu*)"—that is, skin or canvas bags. Alum was a product related to natron, and both were used in Babylonia. From the Neo-Babylonian and Saite periods to the Persian period, then, we find the same products circulating and being traded between Asia Minor, Egypt, Cyprus, Syro-Phoenicia, and Babylonia—using complex and multifaceted procedures and routes. The contextual difference is that the Babylonian documents illustrate the last step in these transactions, the sale in Babylonia carried out by

the merchants (*emporoi*), and they can only suggest the role of the *naukleroi* (Phoenicians, as it happens, in some cases at least) revealed by the Egyptian customs document. The Egyptian customs document, on the other hand, has nothing to say about the mechanisms involved in bringing to market the merchandise imported by this means into the Nile Valley. The merchandise probably was offered for sale by the owners of the boats, not just at Naucratis but also at Memphis, and no doubt at other sites between Thōnis and Memphis.

Conclusion

In the final analysis, it is tempting to conclude that the absence of direct references to commerce and tradesmen on the land routes results primarily from the distorting effect of documentation that is oriented almost exclusively toward the military and political spheres. Our information on customs and tolls seems to confirm the breadth and density of trade. Furthermore, royal assessments could take other forms. We know, for example, that Arab peoples had to pay the enormous quantity of 1,000 talents [ca. 30 tons] of incense to the Great King as a "gift" (Herodotus III.97♦) every year. In reality, this was nothing but a bleeding off of the commercial profits generated by the trade between Palestine and South Arabia.

Chapter 10

Royal Assessments and Tribute

1. Sources and Problems

Tribute and Power

It is useful at this point to devote a separate discussion to Darius's fiscal policy, within the context of the overwhelming task that he undertook, which involved reestablishing order and redefining his predecessors' policies. Given the construction work undertaken in his new capitals of Persepolis and Susa, the military expeditions, the gifts he gave, as well as the basic requirements of the court, Darius had to be able to count on significant, regular income. Actually, as we have seen, Cyrus, Cambyses, and Bardiya had also been careful not to neglect fiscal administration. Assessments on subject peoples did not begin with Darius. It is nonetheless true that every ancient text attributes to Darius a determining role in the establishment of tribute. The problem is to try to evaluate with precision the scope of his actions and their consequences for history.

One of the sources bearing on tribute is the royal proclamations; their intent was to glorify the imperial unification accomplished by Darius without taking into consideration any regional particularities. The Greek sources also exhibit this point of view, for the simple reason that they basically assume that the Achaemenid Empire was a unity, from Sardis to Bactra. Generally speaking, the Classical texts are simultaneously indispensable and enormously frustrating. They offer two contradictory pictures of the impact of Achaemenid tribute: some stress the moderation of Darius's taxes; most, however, love to denounce them as an unbearable burden. They likewise offer two images of the king, who is presented now as a just king, fairly compassionate toward his subjects, and now as a shopkeeper (*kapēlos*), "because of his imposition of regular taxes, and other similar measures" (Herodotus III.89♦).

But the royal texts are constructed from an essentially political and ideological viewpoint: they exalt the mythical memory of an ideal king; however, the majority of the Greek authors are led by a desire (often colored by polemic) to denounce the inherent defects of a system that made the Greeks of Asia "slaves" to the Great King, indirectly, via tribute, which was a metaphor for imperial dominion itself (e.g., Herodotus VII.1 [*douleuō*] and VII.7 [*douloterē*]). This approach is nonetheless analytically interesting. The problem is that neither the imperial nor the Classical version is susceptible to mathematically precise proof. This is why Herodotus's long discussion (III.89–97) of the tax reforms undertaken by Darius is so interesting and helpful. This text offers a wealth of information, even on the level of accounting practice, despite the fact that Herodotus himself is no expert in fiscal matters. He is also focused on the political aspect of royal policy—in other words, on the immediate relationship between tribute levying and imperial dominion. For this reason, he never takes a bird's-eye view. This is why his passage on tribute and taxes still poses many difficult interpretive problems, especially regarding other royal assessments and regulation of revenues.

Diachrony and Synchrony

To analyze the dynamic of the system as a whole, it is essential to broaden the documentary base and introduce later texts into the discussion. In doing so, there is obviously a risk of wiping out the diachronic perspective. Therefore, use of texts later than Darius and Xerxes will have to be justified by whether they fit into a logical and coherent whole. In fact, there is every reason to believe that the tribute system did not undergo any revolutionary modifications—except, obviously, the variations in extent and number of satrapies or the allocation of this or that people to this or that district. At any moment, the king might come up with new assignments (e.g., Arrian I.24.5). We should also recognize that temporary adjustments could be made in the base rate or amount of tribute. A specific example of this is the measure taken by Artaphernes in 492 after the revolt of Ionia (see chap. 12/5). But these localized and limited variations do not appear ever to have challenged the operation of the system in toto. This remark is not meant to eliminate the diachronic dimension in favor of an exclusively thematic approach. We will try to indicate, wherever the evidence warrants it, the changes and potential breakdowns.

As it happens, the most numerous and useful sources date to the end of the Achaemenid period, or more precisely, to the transition between the Achaemenid period and the High Hellenistic age. This wide array of evidence derives from the breadth of the reports written by Alexander's historians, who describe the typically Achaemenid institutions that were taken over (in whole or in part) by the Macedonian conqueror. This wealth of documentation also derives from the increasing number of Greek inscriptions from Hellenistic western Asia Minor. In fact, it is not hard to show that in many cases the institutions from the period of the Diadochi (the successors of Alexander) or the Seleucid kings were copied from Achaemenid practices. Achaemenid institutions can then be reconstructed by looking at their reflection in the evidence, always with an awareness of the need for methodological caution: there is a risk of getting lost in a hall of mirrors!

The last quarter of the fourth century is also the period from which the minor work *Oeconomica* dates. It was written by a representative of the Aristotelian school (and for this reason it is usually attributed to the anonymous "Pseudo-Aristotle"). In fact, the *Oeconomica* has the only overall analysis of the operation of the Achaemenid assessment system. The author seeks a model for *economy* in the sense he understands: the ways and means used by an *oekonomie*, that is, the manager of a house, to "acquire . . . and to guard . . . [and] order his possessions aright and make a proper use of them. . . . For the preservation of wealth it is best to follow both the Persian and the Laconian methods. . . . The Persian system was that everything should be organized and that the master should superintend everything personally" (I.6.1–3♦). After these general reminders in book I, book II contains a condensed but incisive analysis of the four types of *economy* (II.1.1–8♦): "That of the king is the most important and the simplest, that of the city is the most varied and the easiest, that of the individual the least important and the most varied"; the "satrapal economy" is added, organically linked to the royal economy: the *satrapal economy* concerns receipts (tributes, taxes, etc.), and the *royal economy* has to do with the successful management of goods (what the Greeks call *oikonomia*); the king enjoyed revenues procured for him by his satraps. The common principle of the four kinds of economy is simple: "The expenditure must not exceed the income" (II.1.6♦)! There follows

a long series of examples of ruses and subterfuges by which individuals, cities, and satraps amassed the money they were lacking (II.2).

A Greek like the author of the *Oeconomica* took an interest in the Persian Empire because he could thus study the example of an organization where, unlike in Greek cities, the king was never faced with fiscal problems. And it is quite clear that the author saw the reason as being the regularity and size of the assessments imposed by the satraps in the name of the king. This was also the point of view worked out earlier by Xenophon, who, in a work called the *Oeconomicus* on the ideal management of a large estate, highlighted the Great King's interest in his peasants and in "working the land." Xenophon also stressed the way in which tribute afforded the king a means of regularly paying those he owed.

The Documents from the Central Administration

In addition to the Classical sources, we are very fortunate to have documents from the Persian central administration, in particular, the thousands of tablets from Persepolis. In light of this documentation, Pseudo-Aristotle's text may be reevaluated, since the tablets clarify the operation of the royal economy at Persepolis. Babylonia is the best documented region in the remainder of the Empire, even though most of the information on the organization of land and related fiscal matters is later than Darius I. The Babylonian material dates basically to the reigns of Artaxerxes I and Darius II; nonetheless, here too, careful analysis permits us to assume that, basically, the economic structures go back to Darius I and even in some cases to Cyrus and Cambyses. The same methodology applies to the Aramaic materials from Egypt, a fact that assumes decisive importance. The composition and chronological assignment of regional subsets of documents call to mind our basic rule of thumb: despite the global character of the Achaemenid tribute organization implied by Pseudo-Aristotle and Herodotus, it makes sense always to contextualize our analyses by distinct regions. This is why the breadth and specificity of the Persepolis documentation demand separate discussion. At the same time, the questions raised by this documentation lead us to situate them in the framework of the Empire as a whole (chap. 11), before returning to regional studies (chap. 12). Only this sort of "dialogue" between center and periphery will come close to raising, if not resolving, in all their depth, the complicated problems related to the overall functioning of an economic system based on regional tribute.

2. Satrapies and Tributes

Herodotus and the Tributes of Darius

Darius and his advisers tackled the task of tribute reorganization with great speed. Herodotus attests to this haste by writing: "he then proceeded to set up twenty provincial governorships (*nomoi*), called satrapies . . . and assessed [each] for taxes" (III.89♦). The reformed tributes were probably levied for the first time in 518–517, that is, at the end of the moratorium decreed by Bardiya in 522. Following his exposition, Herodotus gives a list of the districts, indicating exactly which peoples belonged to them, as well as the amount of tribute allocated from each (III.90–94). The tabulation is shown on p. 391.

Nomes, Satrapies, and Peoples

This passage from Herodotus has stimulated and continues to stimulate multifarious analyses from historians. Some have maintained that this list contains no credible infor-

Nome	Peoples	Tribute in Talents	Additional Considerations
I	Ionians, Magnesians in Asia, Acolians, Lycians, Milyans, Pamphylians	400	
II	Mysians, Lydians, Lasonians, Cabalians, Hytennians	500	
III	[Hellespontine] Phrygians, Thracians of Asia, Paphlagonians, Mariandynians, Syrians	360	
IV	Cilicians	500	360 white horses
V	from Posideium to Egypt (Arabs exempted)	350	
VI	Egypt, adjacent Libyans, Cyrene, Barca	700	income from the fish of Lake Moeris + 120,000 <i>medimnes</i> of wheat for the Persian garrison at Memphis
VII	Sattagydiars, Gandharans, Dadicae, Aparytae	170	
VIII	Susa and the country of the Cissians	300	
IX	Babylonia and the rest of Assyria	1000	500 young eunuchs
X	Ecbatana, the rest of Media, Paricanians, Orthokorybantes	450	
XI	Caspians, Pausicae, Pantimathi, Daritae	200	
XII	Bactrians and . . . (?)	360	
XIII	Pactyans, Armenians, and neighboring peoples as far as the Pontus Euxinus	400	
XIV	Sagartians, Sangians, Thamanacans, Utians, Myci, and inhabitants of the Erythrean Sea	600	
XV	Saka and Caspians	250	
XVI	Parthians, Chorasmians, Sogdians, Arians	300	
XVII	Paricanians, Ethiopians of Asia	400	
XVIII	Matieni, Saspire, Alarodians	200	
XIX	Moschians, Tibarenians, Macrones, Mossynoeci, Mares	300	
XX	Indians	360	

mation, because its composition is modeled on a Greek literary and poetic tradition going back to Homer's *Catalogue of Ships*. This negative judgment clearly goes too far. For one thing, the comparison frequently made between Herodotus's list and the depictions of peoples at Persepolis and elsewhere is not relevant. These two different kinds of documents clearly pertain to different concepts: one source (documents from the central administration) gives an idealized and ideological representation of the imperial realm (see chap. 5); the other (Herodotus) indisputably refers to an administrative organization. Of course, because he was from Asia Minor, Herodotus clearly Hellenized the facts: it is most striking in particular to note that he begins his list with the Ionian districts, whereas in every Achaemenid document the country lists begin with Persia, which is considered to be the heart of royal power. Similarly, the vitriolic criticisms brought against the figures he provides must be abandoned. It is hardly surprising that

Herodotus encountered various difficulties in converting to talents the amounts that had been furnished to him in darics. But, despite several conversion and arithmetic errors, it is apparent that the numerical information he gives must be considered reliable. The precision suggests quite strongly that he had access—through unknown (and doubtless indirect) channels—to official documents, such as, for example, quotations (written or oral) from the archives of Sardis and elsewhere.

Anyway, even though Herodotus assigns the list of administrative districts to the reign of Darius, it is not certain that some of the information does not date to a later period, that is, the period during which Herodotus was gathering the data to be included in his *Inquiry*. India, for example, was manifestly not included in the system until after Darius's conquest; at the very least, payment of the tribute decided previously could not be imposed until after the conquest. Herodotus (III.96⇨) himself states that "as time went on, other tribute came in from the islands and from the peoples in Europe as far as Thessaly"—that is, in the period subsequent to 512–510. But it is very difficult to be sure of the details.

The rationale behind some of the groupings is not always transparent. Furthermore, it can be quite difficult to locate precisely on a map some of the peoples listed by Herodotus, using names that he has distorted. According to him, the *arkhai* (governments) were called *satrapies* by the Persians and were headed by governors (*arkhontes*). The problem is that we do not have any list of satrapies earlier than the death of Alexander that could be used to systematically verify the statements of the historian from Halicarnassus. We are not entirely devoid of information on Darius's satraps, however. Along with the Greek texts, Babylonian documents and Persepolis tablets allow us to prepare a partial list and correlate it with Herodotus's list.

<i>Satrap</i>	<i>Date</i>	<i>Residence</i>	<i>Herodotus's Nome</i>
Mitrobates	525?	Dascylium	III
Oroetes	+521	Sardis and Magnesia	I and II?
Gubāru	522–	Babylonia and Trans-Euphrates	
Uštānu	535–525		V and IX
Ḫuta[. . .]	521–516	Egypt and Cyrenaica	
Aryandes	486	Susa	VI
Bakabana	525–510?	Bactra	VIII
Dādarsi	500–499		
Irdabanuš	522	Arachosia	
Vivāna	500	Kandahār	XVII?
Bakabaduš	522	Aria	?
Harbamišša	494	Ecbatana	XVI (in part)
Miturna (Hydarnes)	?		X
	503–499		

In some cases (Dascylium, Sardis, Egypt, Susa, Bactra, and Ecbatana), the agreement between the nomes of Herodotus and the satrapal jurisdictions is adequate, as a first approximation at least. But this is not generally true. For instance, there seems to have been a satrap in Aria in Darius's time, and the existence of a satrapy of Parthia or Parthia-Hyrcania is attested at a later period; furthermore, in a very general way, Sogdiana was connected to Bactria. Despite all these things, the Arians are included with the Par-

thians, Chorasmians, and Sogdians in Herodotus's immense XVIth nome. Conversely, Herodotus demarcates a Vth division (III.92) whose boundaries correspond fairly closely to what is usually called Trans-Euphrates (Ebir Nāri). In fact, we know that at the date assigned to Darius's reform, Trans-Euphrates continued to be included within the vast administration of Babylonia and Trans-Euphrates. Within this vast satrapy, Trans-Euphrates apparently constituted a tributary subunit, as indicated by a decision of Darius regarding Jerusalem around 518 (Ezra 6:8), involving "tribute from the province of Ebir Nāri" (*middat 'Ābar nahārê*). Nonetheless, we do not possess documentation that could systematically prove Herodotus wrong. One of the main problems is that in later times there was a distinction between satrapal districts and tribute districts. It is likely that in most cases there was no such difference: the responsibility to collect the tribute imposed on the *ethnē* that were supposed to be under a satrap's authority fell to the satrap. Nevertheless, a late passage in Arrian (I.24.5) seems to indicate that, even after the adjustment of a boundary between two satrapies, an *ethnos* belonging to one satrapy was permitted to continue to pay its tribute in a neighboring satrapy (chap. 16/4).

The method that Darius used to determine the boundaries of the districts and their tribute, as reported by Herodotus, is most interesting: "for administrative purposes neighbouring nations were joined in a single unit (*kata ethnea*), outlying peoples were considered to belong to this nation or that, according to convenience" (III.89♦). From the perspective of tribute, the peoples of a nome were "grouped together (*es tōuto tetagemenoi*)" (III.92♦), they "contribute together (*es tōuto sumpherontes*)" (III.92♦), "a particular sum of tribute was set for all the peoples [of a nome]" (III.90). With just one exception—the Vth division (III.91♦)—the borders of the districts are never given with reference to geographical features. A tribute district was first and foremost a combination of neighboring peoples. The term *ethnos* corresponds fairly closely to a word used by the Great Kings in their inscriptions, *dahyu*. Both refer to a community and to the territory in which that community lived and reproduced.

Setting the Amount of Tribute

There are two texts—late but interesting—that inform us of the practical considerations involved in setting tribute amounts at the beginning of the reign of Darius, one from Plutarch and one from Polyaeus. Tradition records the actions taken by Darius on a very auspicious day:

After fixing the amount of taxes which his subjects were to pay, he sent for the leading men (*hoi prōtoi*) of the provinces (*eparchies*), and asked them if the taxes were not perhaps heavy; and when the men said that the taxes were moderate, he ordered that each should pay only half as much. (Plutarch, *Mor.* 172f♦)

A similar presentation, obviously dependent on the same source, is found in Polyaeus (VII.11.3):

Darius was the first to levy tribute on his peoples (*ethnē*). In order to make it bearable, he did not set the amounts himself, but had them arrived at by his satraps, who set them at an exorbitant amount. On the pretext of kindness to his subjects, Darius reduced the imposts by half. The peoples regarded the diminution as a considerable benefit awarded by the king and paid the remainder gladly.

There is no overarching reason to doubt this tradition, even though it has probably not escaped the heavy hand of royal propaganda; it is easy to recognize the perennial monarchic aphorism in it: "There are no bad kings, only bad satraps"! By opposing the

behavior of his satraps, the king convinced the leaders of the *ethnē* to accept the amount of tribute. In doing so, he very likely broke with previous practice, which doubtless gave too much leeway to the satraps, who were eager to extract from their subjects as much income as possible, so as to enrich themselves personally at their subjects' expense. The king took care to consult both the satraps and the local leaders to *set* the official amount of tribute—hence the repeated use of the verb *tassein* in all its forms by Herodotus, as well as by Plutarch and Polyaeus. We can also better understand the difference that Herodotus points out between the time of Cyrus and Cambyses and the time of Darius: Darius was the first to publish an official tribute list (cf. Herodotus III.89: *epitaxis*; Polyaeus VII.11.3: *prōtos phorous etaxe*). The new king had thus learned a lesson from the revolts he had just quelled, and in this way he also continued the tribute reforms of Bardiya, whom he had just eliminated (see chap. 3/1). It made sense to adopt procedures that ensured the regular payment of tribute without inciting the subjects to challenge Achaemenid domination.

It is difficult to go beyond these general considerations. Nonetheless, several texts explain that the tribute was set 'in proportion to the [subjects'] ability to pay' (*kata to megethos/kata dynamin*). The level of tribute was established in relation to the agricultural resources of the various countries. This is most clearly expressed by Pseudo-Aristotle, analyzing the different aspects of the *satrapal economy*: "Of all these revenues, the most important and interesting is that which derives from the earth; it is called *ekphorion* or *dekatē*" ('tenth'; II.2.4). On the basis of a Hellenistic-period text (the so-called Mnesimachus inscription), it has been suggested that the tribute was set at the rate of $\frac{1}{2}$ per mina of gold [about 500 g], based on a section of land of about 1.5 km².

The original Persian document presupposes a remarkable accounting of the diversity of the Empire, which had to have been based on an in-depth preliminary investigation that surely took several years to carry out. Unfortunately, we do not know the details of this operation, which is comparable, but on a wholly different scale, to the analysis conducted by Aristides, the Athenian, in the towns that had just formed the Delian League (in 478). He was instructed "to examine the situation and the revenues of the various territories in order to impose on each what they had to pay in proportion to their resources" (Plutarch *Arist.* 24.1). Aristides' estimate was very likely based on the analysis conducted by the Achaemenid administration at Sardis in 493–492 after the Ionian revolt (cf. Herodotus VI.42). Whatever the case, Darius's tribute principle was simple: every community in the Empire had to turn over part of its produce (*dasmos*) to the king of kings, including the less-known peoples, such as "the inhabitants of the islands in the Persian Gulf [Erythrean Sea], where the king sends those displaced from their homes in war" (III.93♦).

3. Gifts and Tribute

Herodotus's Viewpoint

The exceptions to the rule that all communities had to pay tribute are even more noteworthy. Among those exempt from tribute (*ateleia*), Herodotus lists the country of the Arabs, which is geographically included in the Vth nome (III.91). The explanation is found a bit further on, where he speaks of the category of peoples "upon whom no regular tax (*phoros*) was imposed, [but who] made a contribution in the form of gifts (*dōra*)" (III.97♦): every two years the Ethiopians on the border of Egypt and their neigh-

bors provided 2 quarts of unrefined gold, 200 ebony logs, 5 Ethiopian boys, and 20 elephant tusks; every four years the Colchians and their neighbors as far as the Caucasus sent 100 boys and 100 girls; every year the Arabs sent a 1,000 talents of incense. We know nothing of the reasons for the special treatment of these peoples, except in the case of the Arabs, who had a treaty with Cambyses. These peoples were also included within the Achaemenid imperial realm, as Herodotus emphasizes, distinguishing them formally from other peoples located outside the boundaries, who were "outside the range of Persian influence" (III.97♦; IV.167♦). Like the tributary peoples, they were gathered into administrative districts "with their neighbors." Nor did they enjoy a general exemption; their contributions were added to those of the tributary peoples, though accounted separately (cf. the phrase *parex tou phorou* = 'separately from tribute'). Like the tributaries, they were required to send contingents to the royal army. In fact, in Herodotus's catalogue of Xerxes' army, we note the presence of Ethiopians and Arabs (VII.69♦; 86♦).

The difference between these peoples and the tributary peoples is, first, that "they taxed themselves"—that is, the amount of their contributions was established (in principle) "voluntarily." There is no doubt, however, that the amounts had been determined in accordance with the "desires" of the king (cf. Herodotus III.13♦). Furthermore, in the case of the Ethiopians and Colchians, the payment was biennial or quadrennial. And, in further contrast to the tributary peoples', their contributions were measured not in talents of silver but in raw materials. In this sense, in fact, "they were not taxed to pay tribute": the Achaemenid administration did not establish a level of payment (*taxis*); it was satisfied with requiring delivery (*apophora*). Finally, we may suppose—but this is pure conjecture—that, unlike the tributary peoples, they sent their gifts directly to the central authority without passing through the satrapal intermediary. Whatever the case, in Herodotus's opinion, these examples were nothing but a peripheral, residual exception within the new financial organization set up by Darius. He stresses the contrast with what had happened in the time of Cyrus and Cambyses (III.89). One example seems clear, at least at first reading—the example of the Cyrenians, Barcaeans, and Libyans. When Cambyses arrived in 525, they all "gave themselves up without a battle, agreeing to pay tribute and sending presents" (III.13♦; cf. IV.165♦). In contrast, in his account of Darius's organization, Cyrenians, Barcaans, and Libyans bordering Egypt were included as tributaries in the Egyptian nome (III.91). But Herodotus's wording also makes it appear that, already under Cambyses, they paid tribute *and* gifts. This raises questions about the differentiation between gifts and tribute that he seems to make elsewhere.

The Gifts of the Tribute-Paying Peoples

Paradoxically, then, in Herodotus donors tend to show up in clusters at the fringes of the Empire at first, but over time the principle of gift-giving to the king persists and even spreads. This calls to mind what Xenophon (*Cyr.* VIII.6.6♦) writes of the tasks assigned by "Cyrus" to his satraps: "Send back here what there is good and desirable in their several provinces." This request achieved great results: "People of every nation thought they did themselves an injury if they did not send to Cyrus the most valuable productions of their country, whether the fruits of the earth, or animals bred there, or manufactures of their own arts; and every city did the same. And every private individual . . ." (6.23♦). We know from Ctesias that the kings of India—obviously in addition to their tribute—were in the habit of producing items at court that were highly valued by the Great King.

Ctesias names a mythical animal, the *martikhōra*, sent as a gift (*dōron*) to the king of the Persians (FGrH 688 F45d; in *Anim.* IV.21, Aelian shows his disdain for the phantasmagorical description by Ctesias). Ctesias also mentions a special kind of iron (*Indica* §4) and a perfume with a powerful, exhilarating scent, “a perfume of which no verbal description can give any idea and which is incomparable. . . . The king of the Indians would send it to the king of the Persians” (*Indica* §28). The Great King also received garments dyed vermilion with an animal dye, whose brilliance surpassed even the famous dye of the Sardians (Aelian, *Anim.* IV.41). Finally, they produced a drug extracted from a bird’s excrement that provided a sweet, tranquil, and rapid death; Ctesias states that “the Indian king included it among the valuable gifts he sent to the king of the Persians. . . . The Great King stored it separately (*apothēsaurisei*) and only he himself and his mother had access to it” (*Anim.* IV.46)! Dino in turn reports “that they sent from Egypt to the Great King ammonia salts and Nile water” (Athenaeus II.67b; FGrH 690 F25b = Plutarch, *Alex.* 36.4). Nile water was said to be “fertilizing and very sweet.” Perhaps Arrian was referring to this custom when, in his description of the oasis of Siwa, he mentions that the locals extracted natural salt. The priests carried it with them from Egypt, he writes, “to be conveyed as a present to the king (*dōron tōi basilei apopherousin*) or to someone else” (III.4.3–4♦).

Nevertheless, these are nothing but fragmentary examples cited by Ctesias’s and Dino’s informants. They obviously refer to a general practice on which the informants’ details agree. The gifts presented to Darius by Pythius the Lydian are in the same category (Herodotus VII.27–28). All of these gifts were part of the Great King’s attempt to gather samples of the produce of each of his countries for his paradises, palaces, table, and bed. There were even special court officers whose job was to receive the gifts sent to the Great King (*apodektēres dōrōn*; [Arist.] *De Mundo* 398a)! The principal function of the building in Persepolis that was called the Treasury may even have been to store all of the valuable gifts received by Darius and his immediate successors. In the Hellenistic inventories of royal treasures, we also find artwork (Diodorus XIX.48.7), jewelry and goldwork (Arrian III.19.5), Hermionian purple (Arrian III.16.6–7; Plutarch, *Alex.* 36.2), vessels, and valuable garments (Diodorus XVII.70–71). One of the “gifts” at Susa was the famous Golden Vine offered by Pythius to Darius (Diodorus XIX.48.7; Herodotus VII.27♦). It is doubtless this gift-giving practice that is evoked—metaphorically—by the famous Persepolis reliefs, in which delegations of peoples from the Empire bring presents representative of the commodities of their countries (animals, fabrics, jewelry, precious vessels, arms, chariots, etc.; cf. also Ps.-Arist., *Oec.* II.34a: *dōra polla anagomena*). The debate surrounding these depictions (tributary peoples/donor peoples) is not uninteresting (chap. 5); quite the opposite. But we should ask whether it is legitimate to make a very broad distinction between the two categories, considering the fact that all of the tributary peoples also had to send regular gifts to the central court.

It seems clear that quite often the Great King himself “suggested” the sending of specific products whose renown had reached the court. Given the powers of the king’s “suggestions,” these gifts might be assimilated to assessments that could not be escaped. This is why it is so hard to distinguish between the gifts and the assessments. This is true also of the gifts that the towns and the peoples had to bring to the king during the movements of the court and the army. It may also hold true for the crowns that the peoples were required to bring to the king at the borders of the country during the travels of the royal

court (and doubtless of the satrapal court as well). We know from a late witness that the crowns were also stored in royal treasuries with “the other gifts (*dōreai*) and spoils of war” (Diodorus XIX.48.8). We should ask whether these “crowns” at some point in time also became an annual obligation, following a development that is known from the Seleucid period. We may also consider a (late) anecdote recorded by Pseudo-Aristotle (II.2.14d) to illustrate the rapacity of Condalus, a lieutenant of Mausolus, the satrap of Caria: “He stated to the Lycians that he had received a letter from the Great King requesting hair for making wigs, and therefore Mausoleus had ordered them shaved bald.” It would be most imprudent here to distinguish between voluntary gifts and obligatory imposts! Note in this context that hair is catalogued by Strabo (XV.3.21) among the imposts in kind due from some peoples of the Empire, along with drugs, dyes, wool, and even animals—in short, “such things as each country produced.” Similarly, the qualitative difference between the gold sent by the Ethiopians as a gift and the gold furnished by the Indians as tribute seems to reflect the politico-ideological domain rather than the purely financial domain. Furthermore, it seems quite clear that refusal to present gifts was punished just as rigorously as failure to pay tribute. We also know that every year Arab peoples had to pay 1000 talents of incense, as a gift (Herodotus III.97). This was in fact nothing other than a tariff imposed by the Great King on the commercial profits generated by trade between Palestine and South Arabia. For the Arabs themselves, the difference between “gift” and “tribute” must have been imperceptible! This is doubtless also the source of the terminological confusion shown by some ancient authors: in Ctesias’s eyes, for example, the produce sent by the peoples to the king’s table fell into the category of tribute (*phoroi*: FGrH 688 F53), whereas it might better be included in the category of taxes (§4 below).

The foregoing discussion makes it clear that gifts were assimilated into what we call tribute. If it were the other way around, the terminological difference would probably disappear. The later example of the Nabateans shows that, at the end of the fourth century, some ethnic groups still regularly operated under the gift system. They are clearly contrasted by Diodorus (XIX.94.10♦) with the “tribute-paying peoples” (*hoi phorologoumenoi*). They “preserve their liberty” (94.2♦), and they consider any agreement with the central authority as equivalent to a contract for the exchange of gifts/friendship (97.4). Let us reread Herodotus once more, who, after describing the “limits of the known world,” writes:

In any case it does seem to be true that the countries which lie on the circumference (*hai eskhatiai*) of the inhabited world produce the things which we believe to be most rare and beautiful. (III.116♦)

Indeed, all of the donor peoples he names (Arabs, Colchians, Ethiopians) are situated in the *eskhatiai* of the Empire, which were controlled less directly by the central authority and could provide exotic products (or products considered to be exotic by the central authority).

From Persepolis to Babylon

At the end of his passage on tribute, Herodotus writes of Persia, distinguishing it from both tributary peoples and donor peoples: “The one country I have not mentioned as paying taxes (*dasmos*) is Persia herself—for she does not pay any” (*ateleia*; III.97♦). Before the discovery of the Persepolis tablets, it was easy to relate this dispensation to the

eminent place that the king himself granted to the Persian country in his decrees. The existence of royal assessments on farm and animal products (including the *baziš*), now revealed by the tablets, calls into question the information provided by Herodotus (cf. chap. 11).

The contradiction between Herodotus's statement and the evidence of the tablets is undeniable, but it is secondary. Herodotus's viewpoint on this subject is first and foremost political: as an *ethnos*, the Persians are not catalogued among the tributaries—not that they are devoid of any obligation to the king (which, for that matter, Herodotus may not have known about!) but that they are not collectively obligated to pay a fixed and itemized annual amount specifically defined as tribute. Of course, the translation of the word *baziš* as 'tribute' is just a useful expedient. The workaday documents confirm that the differences among gifts, taxes, and tributes are only semantic. The labels fluctuate and the differences are uncertain. In the Babylonia of Darius II, communally allotted lands (*hatru*) were leased to the Murašū family, provided that they collect the royal taxes, which were notated (for example) in the form "[One] barrel of beer, 2 *pan* and 3 *satu* [of wheat] and barley, [2] minas of silver, all the tax (*ilku*) for the king's soldier [. . .] and all the gifts/fees (*nadanātu*) for the house of the king (*bit šarri*)." In this sort of document, gifts and taxes are still distinguished in the vocabulary, but they are also incorporated into a general financial obligation, each of whose elements preserves an obligatory value.

The Gifts of the Persian Peasants

To gain a clearer understanding, let us turn anew to that inexhaustible court gossip, Aelian. Several times he depicts the Persian peasantry (*autourgoi*) in their relationships with the king. One story, in which the peasant Sinetes brings some drops of water, which he had fetched by hand from the Cyrus River [the modern Kura River], to Artaxerxes II (I.32; cf. Plutarch, *Art.* 5.1 and *Mor.* 172b), is particularly interesting. Aelian takes this opportunity to cite a Persian custom (*nomos persikos*):

It is a *nomos* among the Persians, and of all the *nomoi* the one that is observed most faithfully, that the inhabitants of places the king passes on his journeys offer him presents (*dōra*), each according to his abilities. (*kata tēn heautou dynamin*; VI I.31)

Two features of the text indicate that the payment of these gifts was obligatory. First is the use of the word *nomos*, which, here as elsewhere, refers to a mandatory rule (obligation) of the Achaemenid court; second is the expression "according to his abilities," which, compared with other texts, refers to a rule of a financial kind: the assessment is proportional to individual resources. We can add that the payments must have been annual, since the king and court came to Persepolis at least once a year.

In fact, the example of Persia itself seems unique: the links between the Persians and the king cannot be equated with the relations between the Arabs or the Colchians and the central authority. When the king came to Persepolis, he himself rewarded the Persians with many gifts. In other words, the Persian peasants' gifts were incorporated into the practice of gift and counter-gift (cf. Plutarch, *Mor.* 172b, 173d, *Art.* 4.5). Herodotus also clearly distinguishes Persia from both tributary and donor peoples (III.97). Despite this real distinction, the logic was basically the same: the king determined whether the assessments of this or that people were called gifts or tribute. In this way, the king distinguished his dominion over these peoples from his relationship with the tributary peoples. But the distinction loses much of its value in practice because, for one thing,

these gifts were kept on an account and were obligatory; for another thing, the tributary peoples also had to give regular gifts.

One sentence of Aelian's provides the key: "All this is called by the name of gift (*kai onomazetai dōra*) and that is how the king considered them (*kai dokei toutōi*)." What made the difference between a "gift" and a financial assessment was thus not the nature of the gift or the level of taxation or the periodicity of the collection; it was an evaluation by the king, itself based on a rule (*nomos*) that everyone knew and no one could exempt himself from. It was the king's prerogative to call an obligatory payment a gift and then to grant the donor recognition as a Benefactor. In other words—returning to the Achaemenid context—the difference between obligatory payments (whether tribute or other financial levies) and gifts was not an artifact of accounting practices; it emerged primarily from the ideological representations of power.

The impression that prevails is that, far from contradicting the fact of tribute, the practice of gift-giving reinforced it. Each people was required to pay gifts whose obligatory character is well established by all of the evidence. Consequently, the difference between gifts and tribute functioned less as a matter of perception than as a matter of implicit symbolism. Tribute, gifts, and other payments participated in the overall functioning of a *tribute system*, the term being taken this time in its generic sense.

4. Tributes, Gifts, and Assessments

Taxes

In order to clarify the entire fiscal picture, a discussion of taxes really must be incorporated into a fuller and more detailed analysis of Achaemenid finances. As the discussion of customs and tolls (chap. 9/3) has already shown, the king in fact received a great deal of other income that can be classed under two rubrics: regular taxes and special contributions. We are ill informed on the former, since our information basically comes from late texts. It will help one more time to quote the indispensable Pseudo-Aristotle and the four other categories he describes out of the six possible sources of satrapal revenue:

Thirdly comes that derived from merchandise (*empōria*); fourthly, the revenue from the cultivation of the soil (*gē*) and from market-dues (*agoraia telē*); fifthly, that which comes from cattle, which is called tax on animal produce (*epikarpie*) or tithe; and sixthly, that which is derived from men, which is called the poll-tax (*epikephalaion*) or tax on artisans (*kheironaxion*). (*Oecon.* II.1.4♦)

Several working documents confirm some of the author's information. The existence of royal taxes (*basilika telē*) and tariffs on commercial traffic (*dekatē tēs emporias*) is attested in Caria in the time of the satrapy of Pixodarus. The variety of taxes seems considerable, levied on many products. At the beginning of the fourth century in Caria, a tax (*apomoirā*) on certain agricultural products was payable to the royal administration. The same tax (on wheat) is mentioned in a text from the city of Telmessus when it was under Ptolemaic rule. Another decree (Seleucid period), found at Aegae of Aeolis, provides an even more impressive enumeration: a *dekatē*, a tax of $\frac{1}{8}$ on fruit, $\frac{1}{50}$ on sheep and goats, $\frac{1}{8}$ on honey, and even "as for the results of the hunt, one leg of each boar and each deer." This sounds a bit too much like an illustration from Pseudo-Aristotle's text regarding taxes levied by the satrap on the fruits of the earth. But aside from some easily explainable diachronic and interregional correlations (royalties levied on the

markets or on the transport of merchandise also attested in Achaemenid Babylonia and Assyria), we must ask ourselves whether the author is specifically describing the system in effect in his time in western Asia Minor. Despite obvious continuities with the Achaemenid period, it is impossible to state that all of these taxes already existed during the time of Darius.

This uncertainty is relieved, at least regarding Babylon, by a (short) series of tablets and the commentaries they have received recently. Several texts dated to the reign of an Artaxerxes (undoubtedly II or III) imply that sales of slaves were registered with an office concerned with royal taxes (*bit miksu ša šarri*); clearly, a special tax was collected on this occasion. This represents a procedure known from Seleucid Babylonia. The establishment of the tax actually goes back to Darius I. Achaemenid–Hellenistic continuities lead us to think that other taxes known from the Seleucid era might go back to the time of the Great Kings; but documentary proof is lacking.

Mines

One of the six kinds of revenue that Pseudo-Aristotle assigns to the *satrapal economy* is “the particular products of the soil in a specific region” (II.1.4). The explanation that follows indicates that he refers only to subterranean products: “This category comprises the particular products of the soil: here gold, there silver, elsewhere copper or whatever is found in the country.” This is a basic aspect of royal policy on which we unfortunately have no specific facts. We know of mines worked by the Greek cities themselves, such as the mines known at Lampsacus, the silver mines of Bactria and Cilicia, the lapis lazuli mines of Bactrian Badakhshan, the various mines of Carmania, the iron mines of Ionia and the Lebanon, and the copper mines of Cyprus, which are attested in Neo-Babylonian texts. The Foundation Charters of Susa also hint at mineral resources in this or that region: gold from Sardis and Bactria, lapis lazuli and carnelian from Sogdiana, and turquoise from Chorasmia. Despite the highly ideological nature of such statements (see chap. 5), they probably do refer to well-known resources found in the various regions.

On the operation of these mines, however, we have no precise information. It is certain that the sources of naphtha in Susiana were part of the royal estate (Herodotus VI.119: *en stathmōi heautou*). The Egyptian stone quarries in the Wadi Hammamât were worked under the direction of Persian administrators and officials during the time of Darius. It is likely that some mines were under the direct or indirect control of the administration—as, for example, was undoubtedly the case for the iron mines of Niriz, Persia, the site of royal workshops for metallurgical products (arms) in Xerxes’ time.

Just about the only mines on which we can gather any information are those in Lydia. They had already been worked by the Mermnadae kings of Lydia, who extracted gold and silver to make electrum. The invention of the process of alloying gold and silver made Croesus famous for his riches throughout the Greek world. It especially made it possible for him to issue gold and silver coinage of high reputation. What happened when Cyrus conquered Lydia? According to Diodorus of Sicily, the Persian was not content with seizing Croesus’s royal treasury but also confiscated the Lydians’ property for his own profit (IX.33.4: *ktēseis*). This did not necessarily involve every Lydian, but perhaps it involved the mine owners. Nor can we immediately conclude that the Achaemenid administration took control of all of the Lydian mines. It is much more likely that he

confiscated the existing gold and silver reserves from the owners—not the mines themselves. In 480, during his march to the sea, Xerxes, his entourage, and his army were treated with extraordinary pomp by Pythius the Lydian (Herodotus VII.27–29). Pythius was well known to persons close to the Great King, and it was from them that Xerxes learned that Pythius had offered Darius magnificent gifts and that he was “the richest man besides the king.” At the time of the Greek expedition, Pythius immediately put at the king’s disposal his entire fortune, namely, 2,000 talents of silver and no less than 3,993,000 darics. Pythius may have been a descendant of the Lydian royal family; we learn elsewhere that he owned several important mines in the Lydian countryside. Even after the Persian conquest, his family thus retained control of considerable mineral resources. We must conclude that operations after the conquest were just as they had been under the Lydian dynasty: the mines of Lydia were worked by private individuals, who now were required to turn over part of their production to the treasury at Sardis so that the satrap could pass its proceeds on to the royal treasuries (and the royal mints). We assume (in the absence of tangible proof) that the owners/concessionaires were also required to provide a very precise annual accounting of their production; these accounting documents, duly verified by the satrapal administration, were the basis for determining the amount of the levy, at a rate that we do not know.

Corvée

Subjects and peasants had more than taxes to worry about. They were frequently placed in *corvée* [forced or statutory labor] to work at tasks undertaken by the royal administration. The case of Babylonia is the best known. We have already seen that the sanctuaries could at any time be required to furnish manual labor upon demand of the satrap, especially for the construction and maintenance of canals (chap. 2/4). This is the system referred to as *urāšu* service, which is known from the Neo-Babylonian period. It involved all owners of real estate, whether sanctuaries or private individuals, particularly those whose fields lay along a canal. It was the responsibility of the royal administrator in charge of canals (the *mašennu* in the Achaemenid period) to announce the levies. It is possible that the organization was systematized during the time of Darius I. At that time, *urāšu* service was one of many financial obligations collectively called *ilku*. The officers in charge of *ilku* were the same officers who had the job of requisitioning manual labor to ensure “the *corvée* of [boat] towing at the quai” or “transport of dues in kind.”

Corvée is not unknown elsewhere, although the evidence is less specific. One of the greatest tasks accomplished with *corvée* labor was the canal across the isthmus at the base of Mt. Athos, by order of Xerxes. Pressed into service were not only contingents of Asian peoples nominally on military duty and grouped *kata ethnē* but also “the natives of [the region of] Athos,” probably recruited from the five cities listed by Herodotus (VII.22♦). It is also likely that the digging of the Suez Canal was accomplished by conscripted peasants (II.159; cf. Diodorus I.33). Within the *dōrea* of Mnesimachus, the establishment of which goes back to the Achaemenid period, the villagers were obligated not just to pay *phoros* in cash but also to perform *phoros leitourgikos*—that is, levies of work days. This is confirmed by a letter from Darius to his manager Gadatas. Going against the tradition of privileges recognized by the royal administration for “sacred gardeners,” Gadatas subjected the “sacred gardeners” of the temple of Apollo “to pay the tribute (*phoros*) and to work profane land,” that is, the territory directly administered by

Gadatas (ML 12). In other words, the peasants as a general rule were subject to tribute and to *corvée* from which the gardeners of Apollo were exempt because of a royal privilege. One of the tasks imposed on people was the maintenance of royal roads, for which the satrapal administration was responsible, according to Pseudo-Aristotle (II.2.14b). In fact, we read in Aelian (*Anim.* XV.26) that, when the king relocated from Susa to Media, he had to cross a region infested with scorpions: "Three days before his passage, he ordered everyone to hunt down these animals, and he rewarded with gifts those who killed the most." The anecdote is colorful and localized, but it undoubtedly implies a more general system of *corvée* and labor requisition of all kinds.

The Obligations of Hospitality

Under the heading of contributions that were "above and beyond" regular tribute were the contributions occasioned by the relocations of the court and the army. Among the weighty obligations at that time, the most ponderous of all was the royal dinner. When the king called a halt near a city, in reality he was imposing on that spot the burden of feeding him and his entourage, an extremely heavy burden. One example of this is Herodotus's account of Xerxes' march in 480. Plans for the welcome had been transmitted ahead of time to the cities and peoples: "In Sardis, Xerxes' first act was to send representatives to every place in Greece except Athens and Sparta with a demand for earth and water and a further order to prepare entertainment for him against his coming" (VII.32♦). Herodotus reports the burden of hospitality perfectly (VII.118–120♦):

Things were even worse for the Greeks who had to entertain the Persian army and provide a dinner for the king. They were utterly ruined, and were obliged to leave house and home. For instance, when the Thasians, on behalf of their towns on the mainland, billeted and fed the army, Antipater, the son of Orgeus, a citizen of the highest repute, to whom the arrangements had been entrusted, proved that the meal cost 400 talents of silver. And similar accounts were returned by the officers in the other towns. A great deal of fuss had been made about the meal, and orders for its preparation had been issued a long time in advance; accordingly, the moment that word came from the officers who carried the king's commands, people in every town distributed their stores of grain and employed themselves for months on end in making barley and wheat flour, in buying up and fattening the best cattle they could find, and feeding poultry in coops and waterfowl in ponds, to be ready for the army when it came. In addition to this they ordered the manufacture of drinking cups and mixing-bowls of gold and silver, and of everything else that is needed to adorn the table. All this, of course, was for the king himself and those who dined with him; for the troops in general the preparations were confined to food. On the arrival of the army, there was always a tent ready for Xerxes to take his rest in, while the men bivouacked in the open; but it was when dinner-time came that the real trouble for the unfortunate hosts began. The guests ate their fill and, after spending the night in the place, pulled up the tent the next morning, seized the cups and table-gear and everything else it contained, and marched off without leaving a single thing behind.

The financial burden was even higher than this, since a formal welcome included the gifts that had to be offered to the king when he reached the outskirts of the city. But peoples and cities had no choice. "Nevertheless the various places along the route did manage to carry out their orders, though not without severe suffering" is Herodotus's pithy comment (VII.120♦)! Any community might be so saddled, including the temples, as seen from several Babylonian tablets from the reign of Cambyses (chap. 2/4). One tablet, dated to the reign of Artaxerxes II, also relates that when the king arrived at

Susa, inhabitants of the neighboring province of Babylonia were also required to contribute. Here too is what Theopompus wrote in his *Philippica*, quoted by Athenaeus (IV.145a \diamond):

Whenever the Great King visits any of his subjects, twenty and sometimes thirty talents are expended on his dinner; others even spend much more. For the dinner, like the tribute, has from ancient times (*ek palaion*) been imposed upon all cities in proportion to their population (*kata to megethos*).

Reading Theopompus (who was writing in the fourth century) causes one to wonder whether these exceptional contributions—at some time or other—were transformed into a regular duty, such as, for example, the “satrap’s table” tax that was levied in coin. We must remember that a distinction between regular taxes and special contributions is partly artificial, especially in the case of peoples and cities located on the routes taken by the king every year from capital to capital.

Royal Taxes and Satrapal Taxes

In addition to all that has been discussed above, the subjects were required to pay various taxes to the satrap himself. The satrap, image of the king in each province, also relocated during the year from one residence to another, quite aside from the breaks he took in his paradise. A text of Polyaeus shows that the satrap traveled with a large retinue and that the populace was required to greet him at the borders. Mausolus, who wanted to capture Heraclea near Latmus, took the Pygela road: “When he passed by Latmus, the city dwellers came out to watch the order and splendor of the parade. . . . Mausolus’s troops found the city empty and the gates open” (VII.23.2). Undoubtedly, on these occasions the inhabitants and local administrators had to bring gifts to the satrap, as they did upon the arrival of the king (cf. Xenophon, *Hell.* III.1.12; Plutarch, *Alc.* 12; Athenaeus XII.534c–d).

Another satrapal tax was called the Satrap’s Table. For example, Plutarch reports (without endorsing) an explanation given by some of Cyrus the Younger’s predecessors for his revolt: “If he broke with the king, it is because he did not receive a sufficient amount for his meals each day” (*Art.* 4.1). On another occasion, Pharnabazus, satrap of Hellespontine Phrygia, was so impoverished by the ravages inflicted on his region that he complained that he had “not so much as a meal in [his] own land” (Xenophon, *Hell.* IV.1.33 \diamond). These texts may be rather vague, but the meal metaphor conceals a financial reality that is clearly brought to light in a passage in Nehemiah:

From the day the king appointed me governor in the land of Judah, from the twentieth to the thirty-second year of King Artaxerxes [I], for twelve years, neither I nor my kinsmen ever ate governor’s bread. Now the former governors, my predecessors, had been a burden on the people, from whom they took forty silver shekels each day as their subsistence allowance, while their servants oppressed the people too. But I, fearing God, never did this. . . . Jews and officials to the number of a hundred and fifty ate at my table, not to mention those who came to us from the surrounding nations. Every day, one ox, six fine sheep, and poultry, were prepared at my expense; every ten days skins of wine were brought in bulk. But even so, I never claimed the governor’s subsistence allowance, since the people already had burden enough [of the construction work] to bear. (5:14–18 \diamond)

‘Over and Above the Tribute’ (parex tou phorou)

Herodotus states that the levies on the peoples who gave gifts were accounted separately from the tribute (*parex tou phorou*; III.97). But he also reports that the peoples

who were subject to tribute were burdened with levies that were “over and above the tribute.” In fact, he notes that beyond the tribute of 500 talents of silver, the Cilicians annually had to furnish “360 white horses (one for each day in the year)” (III.90♦). Egypt, in addition to 700 talents (of tribute), furnished the king “with flour delivered separately (*khōris*); the 120,000 bushels of corn [grain] allowed to the troops and their auxiliaries who were stationed in the White Wall at Memphis.” The king also had “money from the fish in Lake Moeris”—an amount deducted over and above (*parex*) other amounts payable (III.91♦). Babylonia every year had to present “1000 talents of silver and 500 eunuch boys” (III.92♦). The existence of levies in kind, which were added to the silver tribute, is confirmed by Strabo with reference to Media and Cappadocia: “The reports on the tributes paid [by Media] agree with the size and the [productive] power of the country; for Cappadocia paid the Persians yearly, in addition to the silver tax (*pros tōi argyrikōi telei*), fifteen hundred horses, two thousand mules, and fifty thousand sheep, whereas Media paid almost twice as much as this” (XI.13.8♦).

Parallel information is found in a text from Alexander’s time. Alexander ordered inhabitants of the Pamphylian town of Aspendus “to provide fifty Talents for the army as pay, with the horses they bred as tribute (*dasmos*) to the King of Persia [Darius III]” (Arrian, *Anab.* I.26.3♦). This is very much the same system alluded to by Herodotus regarding Cilicia (III.90). Levies of the same kind are known in other satrapies. Strabo writes, in fact, that Armenia had pastures so rich that Nisaeen horses were raised there, which had been “used by the Persian kings. . . . The satrap of Armenia used to send to the Persian king twenty thousand foals every year at the time of the festival of the Mithracina” (XI.14.9♦). This fact must be compared with a note by Xenophon recording a conversation with an Armenian village leader (*kōmarch*): “They asked him again for whom the horses were being reared. He answered, as tribute (*dasmos*) for the King” (*Anab.* IV.5.34; cf. IV.5.24). These were horses that Xenophon learned were “consecrated to the Sun (Helios).” Each village had to furnish a certain number of colts (17 in the village allocated to Xenophon and his men). Each year they were collected by the village leaders (*kōmarchoi*) and sent by the satrap of Armenia to the royal court. Notice the vocabulary used in these texts: these levies are not counted as *phoros* but as *dasmos*. Even though the two words are frequently used (and translated!) identically (cf. Herodotus III.97; *dasmophoros*), their etymologies differ: the *dasmos* constituted the “king’s part,” as in Old Persian *baji*. Arrian clearly distinguishes between the *pharos* and the *dasmos* in regard to Aspendus. Besides the *phoroi* proper (in silver)—from which they were temporarily exempted, in favor of a contribution to the war effort (I.26.3; 27.4)—the Aspendians had to furnish a certain number of horses every year as a *dasmos* for Darius [III].

We do not know why Herodotus chose not to refer to the *dasmos* anywhere other than Cilicia, Egypt, and Babylonia. However, it is logical to infer that this reference to the *dasmos* is an interpolation, because the *dasmos* payments are clearly recorded outside of the tribute proper, which is the topic of his discussion. The information given here and there in the Classical texts always seems formally to imply that the levying of a *dasmos* was a general rule. Apart from his development of the tribute theme, Herodotus is eager to highlight the riches of Babylonia and refers both more explicitly and more generally to the Babylonian section of the Achaemenid tax system:

Apart from the normal tribute, the whole Persian empire is divided into regions for the purpose of furnishing supplies for the king and his army, and for four months out of the twelve the supplies come from Babylonian territory, the whole of the rest of Asia being responsible

for the remaining eight. . . . The governorship (or satrapy, as the Persians call it) of Assyria is by far the most coveted of all their provincial posts.

Then Herodotus details the advantages that the satrap derived from living in Babylonia: stud farms (800 stallions and 16,000 brood mares) and "so many Indian dogs that four large villages in the plain were exempted from other charges (*tōn allōn . . . ateles*) on the condition of supplying them with food" (I.192♦).

Military Levies and the Tax System

The system of levying the public for resources in kind was also the principle underlying the organization of the *ḥaṭrus* [communally held land allotments], which are relatively well known in Babylonia. A military *ḥaṭru* (not all of them were military, to be sure) was required in principle to furnish "the king's soldier" (*šāb šarri*), and the holders of a share had to comply with any order for mobilization. Several documents from the reign of Darius show that, when a tenant farmer received royal orders, he had to set out, fully armed and provided with supplies and money; in other words, it was the soldier himself who paid for his weapons and his upkeep. The cost was great: in 513, a horseman was called up for three years; he had to bring with him a mule (purchased for 50 siculi), whose feed cost him 36 siculi, as well as 12 lightly armed men, who provided their own equipment (clothing, blankets, travel bags, shoes, oil, salt, etc.; *Dar.* 253). There are many examples of more or less regular call-ups from the time of Darius and his successors—not to speak of the requisitions by local authorities. In other words, insofar as we can observe its operation in Babylonia, the reserve territorial army was not maintained at the expense of the royal treasury; on the contrary, tenants to whom service lands had been allotted were not exempt from levies, which they were required to pay every year to the administration.

In normal times, the recruiting and maintenance of the armed forces needed by the king did not necessarily strain his budget. In fact, the organization of the navy was based on a simple principle: the royal administration built the ships (with the help of requisition of manual labor), while the tributary coastal peoples (Greeks, Carians, Lycians, Cilicians, Cypriots, and Phoenicians) provided the oarsmen. This represents a considerable commitment of resources. The principle on which the territorial troops were based is also quite simple: one category or another of the populace had to furnish a certain number of outfitted soldiers in exchange for the use of a parcel of land. This was the case for Persian "expatriates" on large estates in Asia Minor, who, when requisitioned by a satrap, had to provide him with a troop of trained horsemen at their own expense. We know that Persian landholders in Egypt also had to pay tribute (*mandattu*: DAE 71–72 [AD 10–11]). It was the same for companies in Memphis. This is a concrete illustration of the familiar saying, "Conquest begets conquest." Obviously, the royal treasury also paid out significant amounts to ensure the provision of foodstuffs (*trophē*) for salaried garrisons. Xenophon (*Oec.* IV.6) refers to them by the ambiguous term *misthophoroi*, by which he meant not mercenaries but "salaried soldiers," such as the garrisons of Syene-Elephantine, who drew rations in kind (*ptp*) and pay in cash (*prs*) from the royal treasury. Actually, according to the principle of payments *parex tou phorou* defined by Herodotus (I.192), even the *trophē* for the troops was levied via assessments in kind.

Tribute and Tribute Assessments

It is thus confirmed that what we (following Herodotus) call tribute represents only a part of the royal assessments or, to borrow R. Descat's image, "the visible part of the

iceberg of the Achaemenid financial edifice.” This simple observation adds much to the discussion of the functional relationship between gifts and tribute. Each constituted a partial and complementary element of a vastly more complex system. The result of this view is that the distinction between gifts and tribute, which is given excessive weight by Herodotus, is diminished.

5. Payments of Tribute: Metal and Coin

The Phantom of the Natural Economy: Coast and Interior

Let us return to tribute proper. The vocabulary and rationale of Herodotus’s text on tributes (III.96) and Strabo’s (which, in regard to Armenia and Media, carefully distinguishes between products-in-kind and payments in silver; *argyrikon telos*; XI.13.8) imply that the tribute amount was sent in metal weighed in the treasuries. We then may assume that satraps also required tribute to be paid in silver. On the other hand, one could hypothesize the exact opposite, that a “natural economy” prevailed in the Near East. According to this hypothesis, Herodotus’s text gives nothing more than an estimated value in silver of the tribute that was actually paid in kind. But such a broad contrast between a so-called “natural” economy and a monetary economy comes from a Greek outlook that grossly oversimplifies the mechanism of the exchange of goods. One reason for this may be that the tribute obligation posed no technical problem to peoples and cities that were sustained by the circulation of money, especially the Greek cities of Asia Minor: they were able to pay their debts in coin, valued by the satrapal administration according to its weight. In other places, however, tribute was not generally monetized. For example, in the land of Judea toward the middle of the fifth century, the peasants paid their tribute in (weighed) silver, as we know because some complained of having “to borrow money on our fields and vineyards to pay the king’s tax (*middat hammelek*),” or having had “to sell our sons and our daughters into slavery” (Nehemiah 5:4–6♦). In Persia itself, payment in weighed silver is attested as early as 502 (PT 85). Even in countries where taxes such as those in the category *parex tou phorou* were basically assessed in kind (e.g., Herodotus III.91), their payment in silver to royal administrators did not pose insurmountable problems. In Babylonia, where the use of weighed silver was normal, there were businesses whose function was to convert levies on agricultural products into silver. In Egypt, where throughout the fifth-century Athenian and Greek coins circulated, monetary exchange was somewhat less (but not unknown), and the common use of weighed silver there is well attested in several Aramaic documents.

There remains a difficult text in Strabo, included in a chapter about the treasuries (*thēsauroi*) and storehouses (*paratheseis*) that, he says, each Persian king had built to stockpile tribute (*phoroi*). Taking his cue from Polyclitus, Strabo distinguishes between coastal peoples (*paralia*) and inland peoples (*mesogeia*). The king collects silver from the coastal peoples, he writes (*prattesthai . . . argyriou*); from the inland peoples, he obtains products in kind according to the country (*ha pherei ekaste khōra*) (dyes, drugs, hair, wool, and other things—even livestock; XV.3.21). The binary opposition silver :: coast / products-in-kind :: interior obviously corresponds to his distinction between treasuries (silver) and warehouses/storehouses (products in kind)—even if the terminological opposition is more formal than functional (cf. Ps.-Arist., *Oecon.* II.38). But what could be the reason for some peoples to make their payments in kind, when it is quite clear that tribute was always transferred to the central court as metal? And above all,

what could be the explanation for such a clear-cut distinction between the coast and the interior?

An identical distinction seems to be found in one of Diodorus's passage. Speaking of the "great revolt of the satraps" in the 360s, he stresses that the participants were "nearly all the coastal countries" (*hoi parathalassioi*), as well as "the satraps and *stratego*i who governed the coastal districts" (*hoi parathalattioi topoi*); he adds that, "with the revolt so extensive, half the revenues of the King were cut off and what remained were insufficient for the expenses of the war" (XV.90.3◊). But, not only is the witness of Diodorus historically debatable (chap. 15/7), it hardly clarifies Strabo's text. Even though it is true that, on the level of administrative and military organization, the coastal regions were assigned to a single high commander (within the sphere of military operations) on several occasions, there is no reason to suppose that the Achaemenid financial administration set aside a coastal subregion that was defined specifically by its potential for yielding metals or moneys.

Could Strabo have been referring to populations so distant from the trade routes that they were unable to sell their produce? But even this is no reason to suppose that commercial trade (using weighed silver) was restricted only to ports. Indeed, we know that, despite the use of metals, barter did not disappear: Xenophon, for example, describes populations on the east bank of the Euphrates who "brought to Babylon millstones that they sold, exchanging them for food to feed themselves" (*Anab.* I.5.5). Furthermore, Arrian states that the mountain Uxians had "no money (*khremata*) or arable land" (III.17.6◊). But we cannot generalize from these examples (even apart from the fact that Arrian's information on the Uxians is quite unlikely). In fact, a completely different interpretation is suggested by the adventures of the survivors of the Ten Thousand, who several times were able to buy supplies in markets opened by the Persian satrap Tisaphernes. Trade and commerce based on weighed silver existed everywhere, even in countries that might be considered "backward" (e.g., *Anab.* III.5.16). Furthermore, numerous examples show that the interior countries were also well endowed with precious metals (e.g., *Oecon.* II.24a and Polyaeus VII.21.1: a Cappadocian temple pillaged by Datames).

The opposition silver / products-in-kind may reflect a distinction tribute / gifts. Every group of people in the Empire paid both (see above), however, and some donor peoples (in Herodotus's sense) even delivered their "gifts" in metal form (III.97◊). Furthermore, according to Strabo himself (XI.13.8), some inland peoples, such as the Armenians, Medes, and Cappadocians, indeed paid their tribute in silver, but the obligation to raise colts for the royal stud farms was added to this tribute (XI.13.8). Conversely, a strategy described by Pseudo-Aristotle shows that a coastal land such as Lycia had to furnish hair intended for the court of the Great King (II.2.14d), whereas, on the contrary, hair is listed by Strabo among the products in kind specifically levied on the inland countries!

In the final analysis, we cannot really determine the facts of tribute that underlie Strabo's formulation. We are led to think that the interpretations he adopted from Polyclitus primarily express a Greek view of imperial geography. In fact, it was traditional for Greeks to impose a cultural boundary between the coast (*katō*) and the interior (*anō*). We see this clearly in the speech Thucydides puts in the mouths of the Corinthians at the threshold of the Peloponnesian War: the Corinthians urge the interior peoples (*mesogeia*) not to abandon the cause of the coastal peoples (*katō*; I.120.2). Applied to the

Achaemenid realm, this economic-spatial perception leads quite naturally to considering the coast as Greek and the highlands as Persian (e.g., Plutarch, *Cimon* 9.6; *Them.* 26.1 and 30.1). This is why the Greek authors generally admire a man like Agesilaus who—some say (chap. 15/5)—intended to penetrate deep into the highlands (*anōtatō*: Xenophon, *Hell.* IV.1.41) and carry the war “far from the Hellenic sea” (Plutarch, *Ages.* 15.1). This is a recurring viewpoint, expressed many times in the *Anabasis*, as in texts from the beginning of the Hellenistic period. As it happens, the notion of a boundary between the low country and the highlands rested primarily on cultural presuppositions: a cultured, commercial coastal (i.e., Greek) country was contrasted with a highland/interior where a sort of natural (i.e., barbarian) economy reigned—as, for example, in Greece among the Aetolians (Thucydides I.5.3; III.93.3–4). Though this sort of representation is most revealing of the Greeks’ idea of civilization, the modern historian has no well-grounded reason to repeat it when reconstructing the tribute organization of the Achaemenid imperial realm.

Royal Treasuries and Tribute

After being collected by the satrapal authorities, some of the tribute remained on location, in satrapal treasuries. Herodotus, for instance, mentions this fact in reference to Cilicia (III.90): of the 500 talents levied in Cilicia, 140 “were spent on the cavalry who were garrisoned there.” The rest, that is the larger part, was kept (with the proceeds of gifts, crowns, and booty) in the royal treasuries. Once it was gathered, the tribute was stockpiled:

The method adopted by the Persian kings of storing their treasure is to melt the metal and pour it into earthenware jars; the jar is then chipped off, leaving the solid metal. When money is wanted, the necessary amount is coined for the occasion. (Herodotus III.96♦)

Contrary to what has long been thought, this passage makes no reference to the transformation of metal into coins. Strabo, speaking of a later period, explains that, even after royal coinage was put into circulation, a minimal part of the annual tribute receipts was minted: “Most of the gold and silver is used in articles of equipment . . . they consider those metals as better adapted for presents and for depositing in storehouses” (XV.3.21♦). This is the exact meaning of Herodotus’s statement. The passage describes a mode of operation well known from Babylonian temples: all of the silver received, whether from offerings or from debt management, was sent every month to the temple goldsmiths to be melted into ingots. This became the reserve that was available as a source of metal from which, for example, crowns might be made, or diadems to adorn the statues of gods.

The Problem of Royal Coinage

If tribute was not destined for massive monetization, then what was the reason for minting royal coins, whether silver coins (*siculi*, i.e., shekels) or gold coins (*darics*)? The royal coins were sometimes called “archers” by the Greeks, because the king was portrayed as an archer on them (fig. 17, p. 214). Despite continuing discussion regarding the etymology of the word *daric*, the opinion favored today takes into consideration the fact that the first royal coinage was issued by Darius. The date of the initial issue is not known with certainty. We do, however, have a precise benchmark, since a Fortification tablet from year 22 of Darius (500) bears the imprint of a royal coin showing a kneeling archer-king. This coin is of a type (called Type II) whose design may itself be earlier than

500. The discussion of the date of the appearance of Darius's coinage is linked, in part at least, to the purpose attributed to this innovation. The daric and the siculus were struck exclusively at Sardis, at least early on; by transforming Sardis gold into coins, Darius attempted to get some value out of his mining revenues. Perhaps this was why he had the uncomplimentary reputation of 'tradesman' (*kapēlos*), according to Herodotus (III.89). Given these facts, we may assume that Darius made the decision to mint coins on his return from Europe, around 512. There is then, strictly speaking, no relationship between this decision and tribute reform; tribute, we have seen, was paid in weighed silver; the daric was at first a standard of weight (8.30 g). The silver siculus (5.40 g) was different, circulating principally in Asia Minor and probably used to finance military operations in Darius's and Xerxes' time. Issuing the siculus, then, had the effect of driving out the croesids, the coinage that continued to be struck after Cyrus's conquest of Sardis. The siculus, however, was not imposed as the sole coinage; the Greek coastal cities, for instance, continued to strike their own coins, and Greek silver circulated in the Empire more widely than the siculi themselves.

But why create a gold coin whose function was neither to facilitate trade nor to pay soldiers or suppliers? The answer, it is necessary to insist, is the political function of the royal coinage. Not only would the royal image circulate widely by this means but also the innovation would in a way crown the achievements of Darius as a new founder of the Empire. This was the basic idea communicated by Herodotus when he wrote: "Darius wished to perpetuate his memory (*mnēmosynon*) by something no other king had previously done" (IV.166♦). A similar expression is found in Polyclitus, quoted as follows by Strabo (XV.3.21♦): "[Polyclitus] says that in Susa each one of the kings built for himself on the acropolis a separate habitation, treasurehouses (*thēsauroi*), and storage places (*parathesis*) for what tributes they exacted, as memorials of his [good] administration (*hypomnēmata tēs oikonomias*)." In other words, Darius's initiative was not fundamentally economic (in the sense we mean today). It was intended less to pay his expenses than to illustrate his power and expand his prestige; it was at once financial (increasing the value of Sardis gold), political-tributary (imposing an imperial standard), and ideological (establishing himself as a founder). Herodotus and Strabo clearly stress the function of the royal treasuries. The Great King used the treasuries in the context of his policy of redistribution—valuable objects that he could use as rewards; darics could also play this role.

Darius and Aryandes

Herodotus uses the word *mnēmosynon* for Darius's coinage in a story that as a whole continues to pose a number of interpretive problems. He treats it as a revolt by the satrap of Egypt:

Aryandes, by the way, had been made governor of Egypt by Cambyses; he was the same man who subsequently lost his life as the result of an attempt to rival Darius. Aware by what he had seen and heard that Darius wished to perpetuate his memory (*mnēmosynon*) by something no other king had previously done, Aryandes started to follow his example—but he soon got what he deserved for his impudence. The facts were these: Darius had issued a gold coinage, of which the metal was of the greatest possible purity, and Aryandes as governor of Egypt had followed suit by a similar issue of silver—and indeed to this day the purest silver is the Aryandic. Darius, when he came to know of this, disguised the real cause of his anger by bringing a charge of rebellion against Aryandes, and had him executed. (IV.166♦)

Herodotus's text raises more questions than it securely and verifiably answers. The very existence of Aryandic coins is highly doubtful. For one thing, no specimen has ever been found; for another, Herodotus's text is imprecise on this point.

It is possible that Aryandes changed the standard used in Egypt for paying tribute in weighed silver. This could explain why Polyaeus says (VII.11.7), "unable to bear the severity (*ōmotēs*) of Aryandes, the Egyptians revolted." He proceeds to tell how Darius resumed personal control of the country—a story entirely dedicated to exalting the homage paid to the Apis by the king/pharaoh. The date of these events is not certain, but if we separate—as seems reasonable—these events from the revolt mentioned by Darius at Behistun, we may suggest that they date back to the last decade of the sixth century. Perhaps the Egyptians, exhausted by the burden of assessments imposed by Aryandes, brought their complaint to the Great King, who then came to restore order. According to this hypothesis, Aryandes would have contravened the very strict measures taken by the Great King when, around 518, he implemented a revaluation of tribute in weighed silver, an action that was considered fair by several ancient authors. Let us stress meanwhile that, according to Herodotus himself, it was not this kind of deed that provoked Darius's response. In his view, the king wished to punish the excesses of a satrap who had tried to become his rival in the very area Darius considered the defining characteristic of his reign and his power.

6. The Administration of Tribute: Continuities and Adaptations

Peoples and Territories

Having drawn up a general outline of the organization of tribute established by Darius, let us now proceed to its regional applications. The reforms introduced by the Great King and his counselors can give rise to more than one interpretation. On the one hand, Herodotus wishes to describe the universality of the royal decrees. On the other hand, even if each people corresponded to one territory, the political conception at base was not really territorial but ethnic. This was definitely the state of affairs described by the author of the *De Mundo*: "All the Empire of Asia, bounded on the west by the Hellespont and on the east by the Indus, was apportioned according to races (*kata ethnē*) among generals (*stratēgoi*) and satraps and Kings (*basileis*)" (398a♦). Actually, the term *ethnos/dahyu* must be understood in a broad sense, designating all sociopolitical organizations in their diversity.

We may remark that the ethnic principle was the rule in the military organization of the Empire. When Darius was preparing the proposed expedition against Greece, "without loss of time, he dispatched couriers to the various states under his dominion with orders to raise an army" (Herodotus VII.1♦). Xerxes ordered the same thing some time later: "in the process of assembling his armies, [he] had every corner of the continent ransacked" (VII.19–20♦). The mobilization was thus organized by people, with each ethnic contingent led by a local leader (VII.96), and in every Achaemenid army the contingents were arranged *kata ethnea* (cf. Xenophon, *Anab.* I.8.9; Diodorus XVII.58.1; and Quintus Curtius III.9.5). Similarly, in the organization of work on the site of the Athos canal: "The ground was divided into sections for the men of the various nations (*kata ethnea*)" (VII.23♦). But, once they had arrived at the assembly points, the ethnic contingents were relieved of their native leaders and assigned to Persians (Herodotus VII.96♦):

The men who served with the fleet and those who served with the army had their own native officers (*epikhōrioi*); but, as my story does not require it, I do not propose to mention their names. Some of them were far from distinguished, and every nation had as many officers as it had towns. In any case, these native officers were not really commanders (*stratēgoi*); like the rest of the troops, they merely served under compulsion. The names of the Persian generals who had the real command (*ekhontes kratos*) and were at the head of the contingents sent by the various nations, I have already recorded.

Command of the major divisions also fell to the king's men (mainly Persians; VII.82–83; 88, 97–98). The royal army thus cannot be reduced to an agglomeration with no real unity. However, the regular military organization was also territorialized. Xenophon in fact states that every year the territorial troops were assembled for a review that occurred "at the place of muster (*sylogos*), as it is called" (Xenophon, *Oec.* IV.6♦). He names Castolus or the plain of the Castolus in Lydia (*Anab.* I.1.2; *Hell.* I.4.3), the plain of Cayster in Hellespontine Phrygia (*Cyr.* II.1.5), and Thymbara in Syria, where "the rendezvous of the king's barbarians from the interior" (*Cyr.* VI.2.11) was located. These assemblies are also well known from Babylonian tablets from the reign of Darius II. It thus appears that the Empire was divided into a certain number of military regions, whose composition was not strictly based on ethnic criteria. Perhaps it was the same for maritime activities, Cilicia and Cyme being the centers of naval districts.

The tribute system set up during the time of Darius also implies that local political structures were maintained—that is, recognition of the authority of the heads and leaders of the various peoples, whether they were called kings (Cyprus, Phoenicia), dynasts (Paphlagonia), ethnarchs, comarchs, or governors of a town (whether Greek or Babylonian). Within each district, the satrap was responsible to the king for the raising and delivery of the general tribute that had been determined. But we may also presume that each "dynast" or "king" or "city" was individually responsible for raising the portion of the total tribute assessed to his *ethnos* in particular. It was his responsibility to parcel out the burden among the various subassemblies that made up the community that he represented before the satrapal authorities. This arrangement allowed the satrap to avoid becoming directly involved in the complications inherent in the internal distribution of the tribute payment among the various communities of his district. He would only intervene directly if the local authorities managed to evade their obligations.

However, this administrative approach can only be envisaged for peoples who had their own recognized political authority. In other cases, the central authority would have had to fix the tribute amounts for each of the constituent entities. We know, for example, that the Carians were included with others in the IInd nome (III.90), but the Carian subassembly was itself parceled out among various dynasts. Herodotus names four in 480. His personal interest in Artemisia, the queen of Halicarnassus, affords us an interesting detail: she was required to provide 5 of the 70 ships requisitioned from the Carians (VII.99). The division of tribute within the Carian subassembly must have proceeded along similar lines (as well as elsewhere; cf. Arrian II.20.2). In this particular case, we know that the division was almost certainly not made without troubles between dynasts, because the central authority had to intervene.

A late text also suggests that tribute-levying had itself been territorialized. This text is the well-known inscription of Mnesimachus, which details the elements of a *dōrea*, located near Sardis, that goes back to the Achaemenid period (*Sardis* VII.1.1). The

inscription states that tribute had to be paid to the chiliarchy. The term chiliarchy obviously refers to a territorial military organization, which in this case also served as a tribute district. The late date of the text prohibits us from transposing information from it to the earlier period. Let us merely remark that the territory of ancient kingdoms was often divided into new Persian administrative districts—what the Aramaic texts call a *medinah*, both in Egypt and in the countries belonging to the district of Ebir Nāri. This is probably the sort of situation referred to by several biblical texts that speak of the 120 or 127 *medinachs* of Ahasuerus's Empire. Whether or not one grants credibility to the figures 120 and 127, these texts attest to an effort to territorialize the Empire.

Cadastrés in Western Asia Minor

Once it had been territorialized, the Empire could no longer be reduced to the addition and juxtaposition of fully independent ethnic modules. Determining tribute necessitated the establishment of a cadastre (land registry), or at least the setting up territorial boundary markers (*periorismos* in the vocabulary of Seleucid archivists). We know for certain that this was done in western Asia Minor, at least after measures taken by Artaphernes in 493–492 (see chap. 12/5 below), and no doubt such a system already existed at the time of Darius. This is implied, for example, by the confiscation of lands in Miletus in 493 (Herodotus VI.20). It is likely that the royal administration was relying on prior surveys, as suggested by a passage in Herodotus regarding lands and fields in Miletus (VI.29). But, under the Persians, these written documents were recorded by the satrapal administration. The existence of archives at Dascylium is shown by bullas found there inscribed with the name of Xerxes. Cadastrés must be assumed for Sardis, where they were known in the Hellenistic period as *basilikai graphai*. At Sardis they were handled by the *bibliophylax*, who was in charge of recording all land transfers, especially transfers resulting from concessions of royal territory (RC 19).

The Case of Babylonia

While it is true that the Achaemenid administration was at times relying on previously recorded documents, in particular in countries such as Babylonia and Egypt that had long traditions of accountancy, we should nonetheless inquire whether the introduction of Darius's tribute system led to modifications, even in Babylonia and Egypt. From the moment when the conquest brought with it redistribution of some of the land, we must recognize that the administration had to update records of the real estate on which it imposed many different kinds of taxes. There are some seventy tablets, most of them from Babylon during the time of Darius and referring basically to transfers of real estate, that include along with the text a (sketchy) map of the fields that were the subject of sale or of transfer. This kind of document is not entirely new, but these tablets are unusual in including information generally absent elsewhere—namely, the amount of seed grain needed or the number of palm trees planted in a particular field. Such documents, drawn up privately, could only have been written to provide a guarantee to the purchaser. Since these private documents existed, we must conclude that in Babylon (and doubtless elsewhere in Babylonia) an official cadastre existed as well.

Does the establishment of this cadastre go back no earlier than Darius's tribute reform? This is an attractive hypothesis, simply because of the chronological distribution of the tablets: they come from Darius's time. But the rapid and unpredictable change in the Babylonian corpus should cause us to be cautious in this assertion. In any case, there

can be no doubt about the introduction of a financial administration in Babylonia. From the time of Cyrus, we know of a treasurer named Mithradāta. His probable successor was also a Persian, Bagasarū, mentioned in Babylonian tablets from between 518 and 500, where he sometimes has the Akkadian title *rab kāšir* and sometimes the Iranian title *ganzahara*. Both terms refer to the job of treasurer. Thus he was responsible for managing the treasury of Babylon, and as manager, he had a considerable staff under his direction and control of land that went with the position.

The tablets showing the existence of a royal registry office (*karammaru ša šarri*) also show that the obligation to pay a new, special tax on the sale of slaves first appeared during the reign of Darius. The Iranian etymology of the vocabulary (**kārahmara*) clearly shows that this fiscal innovation originated with the Persian administration. This is also suggested by the technical financial expression *zebēlu ša upiyāta* ('delivery of taxes in kind'); the last word, known from Persepolis (*ukpiyataš*), is clearly of Persian origin (**upa-yata*). At the same time, "like other innovations of Achaemenid rule, the practice of registering sales co-opted existing Babylonian offices and accommodated existing forms of Babylonian legal behavior and recording" (M. Stolper, *ZA* 79: 91).

The Case of Egypt

Egyptian bureaucratic traditions are ancient and well known. Traditionally, tax in kind was levied on peasants by heads of districts (*nomarchs*), then, step by step, transmitted to the "chiefs of the granaries," and finally, to the palace treasurer. We would like to think that Darius would not have needed to alter a respected financial administration—as Alexander did much later, at least at first: Alexander divided the entire territory of Egypt between two nomarchs (who had nothing to do with the heads of basic districts) but later "instructed [Cleomenes of Naucratis] to permit the nomarchs to govern their own districts in accordance with the ancient practices (*kathaper ek palaïou*), but to exact the tribute (*phoroi*) from them himself, while they were ordered to pay it over to him" (Arrian, *Anab.* III.5.4⇨). More important, several demotic documents, some of them dating to the reign of Darius, mention the title *sentī*. This title is generally considered to have been applied to a someone who was "director of the fields" or "he who directs the king's scribes who count everything." In some way, these "high bureaucrats inventory the resources, control the level of properties and the apportionment of divine revenues and sacerdotal prebends, organize the raising and allocation of taxes for the king's house" (J. Yoyotte). This *sentī*'s area of responsibility was all of Egypt. In Greek, the title was eventually "translated" *dioikētes*, the same title given to the minister of finance in the Ptolemaic period. It seems that, in any event, the Persian administration took over a Saite institution for its own purposes, though we cannot say with certainty whether they adopted it as it was or adapted it to their own needs.

Finally, the existence of a land register, including royal concessions, is attested in Achaemenid Egypt. For example, several judicial interventions by the Persian authorities imply the existence of an official register of land concessions (cf. *DAE* 2, 18 [AP 1, 16]). One document in particular bears emphasis (*DAE* 69 [AD 8]). Pamūn, an Egyptian, had asked that he be granted land as a gift (**baga*), land that his father (meanwhile deceased) previously had held. The satrap Aršama responded that he would grant the request, if "the domain of Pamūn's father, that farm of 30 *ardab*, was abandoned and was not attached to my [= Arshama's] estate or given by me [Arshama] to any other of my

servants." The precautions (reflected in the conditional clauses) taken by Aršāma prove that he had ordered his manager to verify Pamūn's rights to the farm—which further implies the existence of a register where the different categories of land were recorded. Aršāma's phrase reminds us of a letter sent by the Seleucid king Antiochus I to his *strategos* Meleagrus, who was ordered to carry out a gift of lands to Aristodicides of Assus: "Thus you will make an inquiry as to whether Petra has not been given to someone else." It turned out that "Petra and the adjacent territory . . . had already been given to Athenaeus" (RC 11–12). The inquiry was almost certainly conducted in the royal archives of Sardis (*basilikai graphai*; RC 19, lines 14–16), comparable to the archives known in Achaemenid Babylonia (see above). An institution of this sort certainly existed in Egypt as well: we can recognize it in the term for archives (*st-sšw*), which is found in the text of donations at Edfu and in the "archives of the royal scribe of enumerations" mentioned on the *Stela of the Satrap*: "In later times, the 'place of writings' designates in particular the archives where documents relating to real estate transactions were kept" (D. Meeks). The *bibliophylakion*, known in Greco-Roman Egypt, was obviously the successor of the royal scribe of enumerations.

Weights and Measures

It must also be noted that it was in the time of Darius I that the *ardab*, a measure of capacity of Persian origin (Herodotus I.192) but also known from Greek texts and from Elamite tablets from Persepolis, was first used in Egypt. The Elephantine military's rations in kind were calculated in *ardabs* (DAE 54 [AP 2]). The yield (or area) of a field was also measured in *ardabs* (DAE 69 [AD 8]). Furthermore, in the Saqqara documents (Segal, no. 42a), there is a reference to the *marrīš* (Aram. *mry*), a liquid capacity measure well known from Persepolis and often appearing as the Greek loanword *marris*. We may surmise that the introduction of Persian technical terminology in Egypt corresponds to broader changes. It seems in fact that the word *ardab* was applied to an ancient Egyptian measure, the *khar*. To be sure, the assessments imply a noticeable diminution of the relative value of the latter. Consequently, one wonders whether the introduction of the *ardab* was linked to the establishment of Egyptian tribute in the time of Darius. Paid by the peasants in accordance with a new royal measure, pharaonic tribute would thus have been increased by simply manipulating the weight standard. Whatever the case, it is important to stress that the introduction of the *ardab* was not limited to Egypt: it was also found in Babylonia during the time of Cambyses as well, and the Mnesimachus inscription (Sardis VII.1.1) shows that in the Sardis region, at the end of the Achaemenid period, gardens and *paradeisoi* were evaluated in proportion to the number of *ardabs* of seed needed to sow crops (compare with DAE 69 [AD 8]).

Aramaic documents also refer to standards of weight. For instance, a loan of 4 shekels refers to the "royal standard" (DAE 4 [AP 10]); one sum of 4 *karš* and another sum of 1 *karš* 2 shekels are assessed by the "royal standard" (DAE 33, 38 [AP 6, 15]); warehousekeepers had to provide materials (arsenic, sulfur) "at the Persian weight-standard" (DAE 61 [AP 26]). To be sure, the introduction of Persian weights did not make the other standards disappear. One loan is listed "at the standard of Ptal" (DAE 3 [AP 11]). The borrower committed himself to pay "out of his salary [in silver] which they give him from the [royal] treasury." But the text also specifies the correspondence between the Ptal weights and the Persian measures. If the tribute was paid to the satrap in weighed silver,

it certainly would have required incontestable standards of weight. Several weights of different shapes inscribed with the name of Darius have been found at Susa; others, also stamped with the name of Darius, are known from Persepolis. Their weights range from 1 *karš* (10 shekels) to 70 *karš* (10 minas; cf. *Wa-d*). Others weights have also been found in various regions of the Empire, such as lion-weights from Abydos (one talent) and Trapezus. There is no doubt that these weights were used for weighing tribute.

The Egyptian and Babylonian examples confirm what the previous analyses strongly suggested, namely, that we cannot reduce the impact of Darius's reorganizations to a simple logical correlation of preexisting elements. However large the contribution of his predecessors, it seems quite clear that the new king was able to integrate all of his acquisitions and inheritance into a coherent, efficient system. Despite Darius's retention of the ethnic module, Herodotus was quite justified in characterizing his tribute organization as one of the most striking manifestations of his territorial might.

7. Tribute Economy and Appropriation:

Royal Land and Tribute Land

Royal Territory and Empire

In the eyes of the Greek authors, the tribute system was actually based on a gigantic appropriation of land and people derived from the results of peasants' labor. This is one of Xenophon's favorite themes; he many times states the unlimited rights of the conqueror over peoples and things. It is clear that, from the point of view of Achaemenid imperial ideology, conquered lands without exception came under royal authority. This is what the word *būmi* means. Both Mardonius and Artayctes reminded Xerxes of this, in exactly the same words. Mardonius counseled the king to launch an expedition against the Greeks in retaliation so that "people [would] think twice in future before they invade your country" (*epi gēn tēn sēn strateuesthai*; Herodotus VII.5♦). Artayctes justified the Persian looting of Protesilaus's tomb and *temenos* as follows: he was a Greek "who made war on your [Xerxes'] country" (*epi gēn tēn sēn strateusamenos*; IX.116♦). The same may be said for the objectives of the Delian League, as defined by Thucydides: "Their professed object being to retaliate for their sufferings by ravaging the king's country" (*hē basileōs khōra*; I.96.1♦). By definition, "royal lands" (in the broad sense) had to be kept free from "enemy armies," as Darius himself states quite clearly (*DPd*). Lands that were occupied fell into the category of "enemy territory." Many examples demonstrate that, from the Greek point of view, the king's authority was exercised without discrimination over all of the countries where he exacted tribute, which itself was the very symbol of subjection. It is thus easy to understand how the conqueror justified laying claim to what was his. In the same way, Alexander said to Darius III: "The country is mine (*kai tēn khōran ekhō*), the gods have given it to me" (Arrian II.14.7). From that moment on, Alexander was master (*kyrios*) of all that had been Darius's (II.14.9); he was "the master of all Asia" (*tēs Asias hapasēs kyrios*; II.14.8), as Darius I had been (cf. Aeschylus, *Persians* 763: *pasēs Asidos . . . tagein*). In this sense, "as goes the royal house (*oikos basileōs*), so goes the Empire" (e.g., Thucydides I.129.3: *en tōi hemeterōi oikōi*).

The Great King's Sluices and the qanats of the Hyrcanians

The Greek texts are too propagandistic, however, for us to accept them without some other sort of analysis. Let us return to Herodotus, who wrote:

There is a plain in Asia surrounded by a ring of hills, which are broken by clefts in five separate places. This tract of land used to belong to the Chorasmians and lies on the boundaries of five different tribes: the Chorasmians themselves, the Hyrcanians, the Parthians, the Sarangians, and the Thamanæans; but ever since the Persian rise to power (*ekhousi to kratos*) it has been the property of the Persian king (*esti tou basileōs*). Somewhere in the ring of hills a considerable river arises—the Aces—which used to supply water to the five tribes I have mentioned, being split into five channels and flowing out to each of them through a different gorge; now, however, that the Persians are masters of the country (*hypo tōi Persēi*), all these peoples find themselves in a serious difficulty, for the king blocked up the gorges and constructed sluice-gates to contain the flow of water, so that what used to be a plain has now become a large lake, the river flowing in as before but no longer having any means of egress. The result of this for the people who depended upon the use of the water, but are now deprived of it, has been disastrous. In winter, to be sure, they get rain like anyone else, but they need the river water when they are sowing their millet and sesame in the summer. When therefore, they find themselves waterless, they go in a body with their wives to Persia, and stand howling in front of the gates of the king's palace (*kata tas thyras tou basileōs*), until the king gives orders to open the sluices and allow the water to flow to whichever tribe it may be that needs it most. Then, when the land has drunk all the water it wants, the sluices are shut, and the king orders others to be opened in turn, according to the needs of the remaining tribes. (III.117♦)

There is little doubt that Herodotus's tale is not to be taken literally. The oral histories he heard were obviously grafted onto Indo-Iranian (including Achaemenid) legends of sovereignty, in which water held a central place (cf. chap. 6/5). In the same manner, an Indian New Year's festival was organized around a divine hero's combat with a dragon that, barricaded in a fortress, kept the surrounding country parched and arid. The victory of the hero freed the waters from the walls behind which the dragon had kept them plugged up.

But we should also stress the fact that Herodotus's passage is included in his section on tributes. After giving the list of tributary countries (III.89–98), he examines the territorial limits of the authority of the Great King—toward India (III.98–105), which he places at “the remotest parts of the world” (III.106♦), then toward the south, that is Arabia (III.107–13) and toward Ethiopia, “the furthest inhabited country toward the southwest” (III.114♦) and finally, toward the lands of the west (III.115–16♦). Then comes the passage on the Great King's sluices. It is thus clear that in Herodotus's mind, this example especially illustrates the power of Darius and the results of the Persian conquest for the subject peoples' way of life and internal organization. After the conquest, the land “belongs to the king.”

The Persian conquest did not merely result in the establishment of tribute. The Great King thereafter controlled the water, which was the determining factor for production in regions dependent on irrigation. Put another way, he thereafter governed the allocation of water within the various communities that, we may presume, had previously organized their own water access agreements. But in this case, royal control was particularly burdensome, since the population had to pay special taxes to be able to use irrigation water, taxes that were in addition to the tribute (*parex tou phorou*). Their dependence is noted by Herodotus, who depicts them as supplicants coming to the Gates of the palace, like the folk thronging an antechamber before obtaining an audience with the Great King or one of the satraps. Even in the form of monarchic fable that it has assumed, Herodotus's presentation expresses a real state of affairs: the deepening of Persian

dominion went hand in hand with the development of a tribute economy, the driving force behind royal appropriation.

The connection between Persian dominion and control of water rights is confirmed by Polybius in a well-known passage concerning the *qanats* tunneled by the Hyrcanian peasants: "At the time when the Persians were the rulers of Asia (. . . *Persai tēs Asias epekratoun*) they gave to those who conveyed a supply of water to places previously unirrigated the right of cultivating (*karpeusai*) the land for five generations" (X.28.3♦). Among other things, this text points out the close relationship between territorial dominion (the right of conquest) and peasants' rights to land and water. In this case, the rights of rural communities do not derive from the category of "property" but only from concessions granted by the king for the use of the produce (*karpeusai*) for a long but limited time. The texts indicate quite clearly that the Persian conquest resulted not in a general confiscation of land but rather, by means of tribute and taxes, in the king's control over the means of production and his acquisition of part of the harvest.

Royal Land and Concession Lands

Concessionary plots were taken from the royal land and given (*dōrea*; *baga*; *dāšna*; *nidintu šarri*) as benefits to favorites or relatives of the king or to colonists (military or not). This is the implication of a Hellenistic text that details the terms of a concession of lands to a man named Aristodicides, of Assus. He obtained a *dōrea* that previously had been conceded to someone else (Meleagrus; RC 11, lines 3–5). This *dōrea* had been royal land (*khōra basilikē*; RC 12, lines 19–20). The formula used shows that, in principle, royal concessions were revocable. A particularly clear illustration of a revocable royal concession appears in another case, the case of the *dōrea* of Mnesimachus, near Sardis. The case obviously dates back to the Achaemenid period. Mnesimachus had borrowed a large sum from the sanctuary of Artemis. In writing up the guarantee for the debt (secured by the harvests of the *dōrea*), the administrators of the Artemis temple took into account the possibility that the king (Antigonos) would repossess the land. This was necessary because, fundamentally, the land still belonged to the category of royal land (*Sardis VII.1.1*).

The practice of granting concessions of royal land is confirmed by many Aramaic documents from Egypt. For example, we know of the existence of military plots at Elephantine, which are reminiscent of the Babylonian system of *ḥaṭrus*. In addition to rations in kind (*ptp*) and in silver (*prs*), which were received from the royal storehouse, the soldier-colonists of Elephantine had plots of land. The earliest document—dated 495 (DAE 2 [AP 1])—shows that these plots (*mmt*) were allocated by the administration, sometimes in parts, and that it was the administration's responsibility to adjudicate any litigation that might arise in this connection. Under Artaxerxes (I or II), one colonist represented himself as follows: "Malkiyah, an Aramean holding property (*m^eḥaḥsen*) in Elephantine-the-Fortress" (DAE 9 [AP 7]). Another document—dated to Artaxerxes I—records a dispute between a colonist and two women. The colonist is complaining to the Persian authorities that the women have not paid him the money owed on a field that, he states, "our company (*dgal*) held from the 24th year to the 31st year of Artaxerxes" (DAE 18 [AP 16]). The word 'held' (*m^eḥaḥsen*) formally indicates that these plots of land were not the private property of the concessionaire. We suspect that an identical system was in effect at Memphis, because a Saqqara papyrus refers to the

“fields of the garrison” (*haylā*) (Segal, no. 31), on which the garrison’s soldiers paid tribute (*mdtʿ*; Segal, no. 18). The same situation obtained for the boatmen who “held” a boat belonging to the administration (DAE 61 [AP 26]). In another document (DAE 69 [AD 8]), the Egyptian Petosiris, son of Pamūn, a stableman of the satrap Aršāma, brings a complaint to Aršāma. Petosiris reminds the satrap that his father, before he disappeared in “the troubles,” had held an estate. Now the son is making the following petition: “Now give the domain of . . . my father to me; . . . (command that) they assign it to me, (that) I may hold (it).” One of the things that this text shows is that a satrap could concede lands as a gift (cf. DAE 62 [AD 2]: *dšnʿ* = **dāšna*) but that lands of this sort remained in the category of “holdings”; it was the heir presumptive’s responsibility to request confirmation of the previous donation.

The oldest Aramaic document (DAE 1 [Bauer-Meissner papyrus]) is also very interesting. It is dated to year 7 of Darius I (515) and was written in a place in El-Hibeh (Teuzoi). It deals with a contract between the holder of a field, named Padi, and a peasant, called Aha. Padi was very likely a member of an Aramaic (or at least Aramaic-speaking) community established at the oasis in either the Saite or the Persian period; Aha was a native Egyptian. Padi provided the land, Aha the seed, tools, and labor; the two parties had agreed to share losses and profits. Now Padi describes his field as being his “portion from the king (*h[l]qy lmlk*).” Furthermore, the contract is accompanied by a conditional clause: the contract is only valid if the king approves it (or does not oppose it). This clearly indicates that a holder of a concessionary plot had only limited use of the land. In the act of concession, the king did not rescind his own rights. The status of Padi’s land was thus quite similar to the status of the colonists’ plots at Elephantine.

Darius and Gadatas, Alexander and Priene

Despite all of the examples above, it is still important to remind ourselves that the concept and extent of Persian royal land are difficult to grasp. On the one hand, no Greek literary text actually uses the expression *basilikē gē* ‘royal land’ or *khōra basilikē* ‘royal holdings’ to characterize Achaemenid royal land in the sense used here. On the other hand, it is important to stress the relevance of a letter that Darius sent to Gadatas, who in all probability was manager of a paradise near Magnesia on the Meander:

The sacred gardeners (*phytourgoi hieroi*) have been subjected by you to tribute (*phoros*) and required to work profane land (*khōra bebēlos*). (ML 12)

In this letter reproaching his manager, the king very clearly refers to two categories of land: land that belongs to the sanctuary (what the Hellenistic texts call *hiera khōra*) and “profane land.” The latter is also described quite clearly in another passage in this letter. Darius congratulates Gadatas for the care taken in cultivating land ‘which is mine’ (*tēn emēn gēn*). The same expression is found in a letter sent from Alexander to the city of Priene in 334. In it the king distinguishes several categories of land and population: the city lands (which were exempt from military levy: *syntaxis*) and other (adjacent) land, whose inhabitants (*katoikountes*) were subject to tribute (*phoroi*). Regarding this second category, Alexander states emphatically: “I know that this land is mine” (*khōran [g]inōskō emēn einai*; Tod 185). In addition to the fact that there are terminological similarities between these letters and the statements of Mardonius and Artayctes (Herodotus VII.5; IX.116; see above), the two letters are especially instructive in that they come from the royal chancelleries.

From a comparison of these documents we can perhaps draw two conclusions: first, the territory of the paradise, about which we were not entirely certain, counted as what the Hellenistic texts call royal land (*khōra basilikē*). Second, royal appropriation did not imply that all the land of the Empire was considered the *property* of the Great King (in the Roman sense of the word *property*). The conquest did not result in a sudden, general confiscation of land. People continued to possess (according to their local standards) their traditional lands. The boundaries of villages, cities, *ethnē*, sanctuaries, or kingdoms were recognized by the administration, and it made these boundaries the basis for taxation. In discussing appropriation, we should be thinking not of rights of ownership but of the Great King's direct or indirect *control* over production and the producers.

Following a revolt, the Great King might confiscate lands and redistribute them however he liked. This happened in the region of Atarnaeus, which around 545 had been conceded to Chios (Herodotus I.160). It also happened in 493 to the territory of Miletus (= *khōra politikē*): "The Persians themselves occupied the land in the immediate neighbourhood of the town, and the rest of the cultivated region which belonged to it, and made over the mountainous interior to the Carians of Pedasus" (Herodotus VI.20♦). Thus we see that the king might award extra land to a deserving city or people, taking it from earlier confiscations. These awards of land are attested frequently in the Hellenistic period. The Great King's gift of a territory to Ešmunazar, king of Sidon (see chap. 12/3), suggests that the same practice existed in the Achaemenid period. The local maintenance of private, community, or civic property did not really contradict the king's right to use the Empire's lands. We might say that all rural property was in a way stamped with a character of revocability. In most cases, the king had no intention of confiscating the lands in question, and so this royal prerogative usually remained theoretical. However, everyone also knew that the prerogative would be exercised without hesitation in the case of an unfaithful or revolutionary individual or population.

Tribute-Producing Lands and Crown Lands

To proceed, we must return to Pseudo-Aristotle, the author of the *Oeconomica*. In this invaluable treatise, he formally distinguishes a particular type of assessment from assessments imposed under the label *tribute*. He writes in fact, regarding the receipt and disbursal of products managed directly by the royal administration, that they "were received by the satraps as *tagē*" (II.1.3). This is a difficult word, which a later lexicographer (Hesychius) understood as "the royal *dōrea* and the entirety of things required for life." Here, the word *dōrea* must be understood in the context of the royal economy, that is, land held by concession, except that this time it was the king himself who was the beneficiary. These lands in *dōrea* are often characterized by the Classical authors as sustaining gifts. The best-known example (but not the only one) is Themistocles, who received revenues from several towns. Each one had to provide him bread, wine, fish, wardrobe, and part of the expenses of his house. This is precisely how Hesychius defined the *tagē*: its revenues went to satisfying the needs of the king. Given the fact that *dōreai* are attested in many satrapies, we must recognize that throughout Imperial territory portions of land were reserved for the needs of the king. This is precisely the system defined by Herodotus in connection with the financial category *parex tou phorou*: "Apart from normal tribute, the whole Persian Empire is divided into regions for the purpose of furnishing supplies (*trophē*) for the king and his army" (I.192♦). It is thus legitimate to con-

clude that the word *tagē* refers to a specific category of land, which we will call “crown lands,” on which the king levied assessments directly. Pseudo-Aristotle makes it clear that these assessments were products in kind. As the author says, it was up to the king to do with these products as he pleased, once they had been stocked in the royal granaries or storehouses (*paratheseis*: II.2.34a).

Another passage from Herodotus, ephemeral though it may be, helps us clarify how *tagē* lands functioned in practical terms. What it says is that from Egypt, along with its tribute, the king benefited from the proceeds (in silver) of the fish from Lake Moeris (III.91). Other concessions of this type were known in Egypt, such as the city of Anthylla, which was “made over ever since the Persian conquest of Egypt to the wife of the reigning monarch to keep her in shoes” (Herodotus II.98♦). In this custom we find an adumbration of the well-known Achaemenid custom of allowing princesses to own lands and villages in the Empire; the revenues from these lands made it possible for them to maintain a household. According to Athenaeus (I.33f), the revenues of the Egyptian city of Anthylla were sent to princesses in the Persian period. Diodorus Siculus (I.52.5♦) said of Pharaoh Moeris, “The income accruing from the fish taken from the lake he gave to his wife for her unguents and general embellishment, the value of the catch amounting to a talent of silver daily.” This was not the way it was in the time of Darius, when, according to Herodotus (II.149; III.91), the revenues were paid directly to the royal treasury (*to basilikon*).

Unfortunately, apart from this passage, direct references to the category we here call “crown lands” are rare. Let us return to Strabo’s materials on animal tribute from Cappadocia, Armenia, and Media (XI.13.8). They must be compared with what we know about horsebreeding in this region. Strabo had just said (XI.13.7♦), “This . . . is an exceptionally good ‘horse-pasturing’ country; and a certain meadow there is called ‘Horse-pasturing,’ and those who travel from Persis and Babylon to Caspian Gates pass through it; and in the time of the Persians it is said that fifty thousand mares were pastured in it and that these herds belonged to the kings (*agelai basilikai*).” Arrian (VII.13.1) in turn gives the figure of 150,000 Nisaeen mares (160,000 in Diodorus XVII.110.6). In fact “Nisaeen” horses were raised there—named for the Plain of Nisaea between Behistun and Ecbatana; it was famous for its alfalfa, which was called “Median grass” (cf. Herodotus VII.40♦). This, Polybius says, is the reason for “the royal stud farms being entrusted to the Medes owing to the excellence of the pastures” (X.27.1♦). Just like the Babylonian stud farms (Herodotus I.191), those in Media were doubtless considered part of the *tagē*, whose produce was furnished “in lieu of tribute in silver.” It must have been the same for the stud farms of Aeolis that, being royal property (*ta basilika*), were managed by specialized administrators (Plutarch *Eum.* 8.5).

Perhaps forests, which are included implicitly by Pseudo-Aristotle in the category “products of the earth,” were also part of the *tagē*. A decree from the Hellenistic period (213) confirms the existence of royal forests in Asia Minor. To rebuild the city of Sardis, Antiochus III issued the following order: “Let wood immediately be cut for the rebuilding of the town and let it be taken from the forests of Taranza.” This probably refers to the famous forests of Mount Timolus, which were quite close to Sardis. The text is clear: if a person was on business for the king, it was not sufficient to allege that he was who he said he was in order to have merchandise delivered; it was necessary to produce a written order from the king (or the satrap) before the managers would release material. This was

also true of the royal stud farms (Plutarch, *Eum.* 8.5). The existence of royal forests is also attested in Mysia, and the luxuriance of the forests of Trachaeian Cilicia is emphasized by Strabo. He notes that the pine wood from this region was regularly used for shipbuilding. The Cilician coast was precisely where the Persians had set up their great shipyards.

Other regions of the Empire, such as Babylonia, were less well off. Strabo refers several times to a lack of timber for construction, except for the trunks of date palms (XVI.1.5 and 11). In 324, Alexander also had to import wood and carpenters from the Lebanon. Nonetheless, Strabo (XVI.1.11) goes on to say that the king was able to set up navy yards in Babylon by making use of cypress that was cut in the woods and paradises. We know that the paradises were famous for the beauty of their trees and forests (cf. Plutarch, *Art.* 25.1–2; Diodorus XVI.41.5), but these woodlands had a greater purpose in life than just to provide shade for satraps and kings! They were also profitable estates. For instance, when Nehemiah was sent to Jerusalem by Artaxerxes I, he bore an official letter addressed to “Asaph, keeper of the king’s park” (Neh. 2:8♦, whom we identify as the manager of the royal forests of the Lebanon. This means that, as early as 538, the royal administration ordered “Sidonians and Tyrians to bring by sea as far as Joppa cedarwood from the Lebanon” for rebuilding the temple in Jerusalem. These were the same royal forests from which Antigonus the One-Eyed had thousands of trees cut in 316 to build the fleet with which he intended to conquer Egypt. The forests of the Lebanon remained royal estates through the Hellenistic period, as shown by the order given in 200 by Antiochus III regarding the ornamentation of the temple in Jerusalem.

An Appraisal and Some Uncertainties

Let us review. It is not always easy to identify the boundaries between tribute land and the *tagē*. The texts cited above do not allow us to conclude with full certainty that stud farms and forests were part of the *tagē*, even though that is the interpretation adopted in my hypothesis. The Babylonian tablets refer to a category of lands called *uzbarra*, a word of Iranian origin that is currently understood as “royal land,” as opposed to other categories of land. Sometimes the ‘king’s portion’ (*zitti šarri*) was assessed on *uzbarra*. Portions of royal land could also be conceded to court personnel, by way of royal gifts (*nidintu šarri*). But many questions remain about the extent of royal land in Babylonia.

In actuality, *royal land* remains highly ambiguous. Evidence appears in two parallel Hellenistic cases: in one, King Antiochus ordered the concession of land to a favorite (Aristodicides of Assus) and specified that the land be taken from the royal land (*khōra basilikē*; RC 11–12). In the other case, Antigonus reminded the Greek coastal cities that they were strongly urged to purchase wheat that came from tribute land (*khōra phorologoumenē*; RC 3). Were Antiochus and Antigonus referring to two categories of land distinguished by differing terminology or to a single category with only minor distinctions specified by the context? I would suggest that in the politico-ideological sense of the term, “royal land” merged with tribute land—that is, with the Empire in its entirety (this is the understanding held or implied by Herodotus in his tribute discussions). But in a financial-economic sense, royal land was reduced to the royal *dōrea*, or the *tagē*, which I render here with the phrase *crown lands*. Seen in this framework, the Persepolis documents allow us to refine this term’s contours.

Chapter 11

Persia: Empire and Tribute Economy

1. The Persepolis Archives

Fortification Tablets and Treasury Tablets

In 1933–34 and 1936–38, two lots of tablets were discovered at Persepolis by American excavators, the first in the northeast corner of the terrace, the second in the southeast part. Because of the findspots, they have come to be called the Fortification tablets (PFT) and the Treasury tablets (PTT). The latter were published in 1948 by George G. Cameron, who continued editing them in later years (PF 1957, PF 1963). There are 129 of them, and they date between year 30 of Darius (492) and year 7 of Artaxerxes (458). An Akkadian tablet written in December 502 (PT 85) was also found. The Fortification tablets, dating to years 13 through 18 of Darius (509–494), are much more numerous. In 1968, Richard T. Hallock published 2,087 of them, and another 33 ten years later (PFa). Others have also been published separately since then. In a 1977 article, Hallock announced that he had studied nearly 4,500 of them, but we are still awaiting the publication of the texts he had transcribed before his death. There are, moreover, approximately 500 tablets in Aramaic and 80 Aramaic glosses/dockets on Elamite tablets. Five hundred eighty seals are found on the tablets (86 with inscriptions). Some are published (PTS); others are under study (PFS). Mortars and pestles have also been found at Persepolis, with 163 Aramaic inscriptions, which were published in 1970 by Raymond A. Bowman. They are dated (theoretically) to the reigns of Xerxes and Artaxerxes, between 479/8 and 436/5. Unfortunately, several hundred Aramaic texts and inscriptions remain unpublished. There are also a handful of texts in other languages: 2 Akkadian tablets (PT 85, Fort. 11786), a short Greek text (Fort. 1771), and a text in Phrygian (probably). Thus there are several thousand tablets and inscriptions available to historians of the Achaemenid Empire.

With just one exception—and it is difficult to interpret (PT 4–5)—the Persepolis tablets are not narrative documents. There are no treaties, no recountings of military expeditions, not even any indirect allusions to dynastic history. Basically, the Fortification tablets deal with the collection, warehousing, and distribution of foodstuffs. The recipients are the king and the royal family, high officials in the administration, priests (or religious attendants), cattle, and especially groups of workers (*kurtasš*) in the chancelleries, rural establishments, workshops, and construction sites of Persepolis. An especially complete category (Category Q) records the distribution of food rations to persons and groups traveling from place to place within the Empire. The subjects reappear in three other series: letters, journals, and warehouse accounts. The Treasury tablets, on the other hand, primarily record the distribution of rations to the craftsmen who worked on the construction sites of Persepolis under Darius, Xerxes, and Artaxerxes I. Some of the rations were disbursed (or valued) in silver, instead of only food products, beginning in 493/2.

The entire documentation is extraordinarily concentrated in time and space. Aside from the travelers' provisions (Category Q), they cover a geographic area limited to central Fārs and Susiana, from Susa in the northwest to Niriz in the southeast. The Treasury tablets are almost exclusively concerned with operations in Persepolis itself. Otherwise, the chronological distribution is very irregular, with 46.5% of the Fortification tablets dated to Darius years 22 and 23 (500–499)—72% for Category Q (travelers' provisions). Most of the Treasury tablets are assignable to the reign of Xerxes (486–466), and, within that span, more than 60% date to 466, with 90% of his reign unattested. It is difficult to draw historical conclusions from these percentages. The excavators' spade has obviously uncovered only a tiny portion of the central archives of Persepolis. A significant number of administrative records must have been written on perishable materials. The Fortification tablets frequently mention Babylonian scribes writing on parchment—a method known not only from Classical authors (Herodotus VII.58, Diodorus II.32.5: *diphtherai*) but also from the correspondence of the satrap Arsames, which was written on skin (DAE 62–74 [AD]; cf. FG7H 115 F263a). Parchment is even explicitly mentioned at Persepolis: a letter on a clay tablet from Princess Irdabama refers to a parchment document (PFa 27). References in Herodotus (VII.239; cf. VIII.90) and Aelian (VH XIV.12) state, furthermore, that wax-covered wooden boards, well known in Babylonia from the Neo-Babylonian period (and attested earlier among the Hittites and Assyrians), were still in use. Given these facts, we need to realize that we only have the archives of a few offices. Going by documents surviving from other, earlier Near Eastern kingdoms, we know that we are missing other archives that would have dealt with the care and management of other goods, such as valuable objects, arms, and even clothing. Ancient tales dealing with the sack of Persepolis by the Macedonians clearly confirm our intuitions in this regard (e.g., Quintus Curtius V.6.3–5: textiles, furniture, royal garments, ceramics, etc.).

This documentation will potentially assume enormous importance in the process of conceptualizing Achaemenid history, particularly regarding its economic and tribute organization. In particular, it allows the development of an analysis based on the central authority rather than merely on Classical sources, which, however important they may be, remain spotty and often biased. But, paradoxically, historians have used the Persepolis tablets in no more than piecemeal fashion. The basic reasons for this *relative* neglect are related to language. The first decipherers in fact ran into considerable difficulties that are still far from fully overcome, in spite of the considerable progress already achieved. Aside from a few very rare exceptions, the tablets are written in Elamite, the language of the Anšan and Susa bureaucracies. From the linguistic and syntactic point of view, Neo-Elamite still offers specialists formidable problems, to the point where certain accounting practices implied by the tablets are still so uncertain that sometimes one cannot tell the action from the agent! Moreover, a large proportion of the personal and geographic names and the specialized vocabulary is of Persian origin. And we do not possess a Persian literature from this period that would allow us to compile a complete Persian–Elamite dictionary. The only synoptic texts are the royal inscriptions, which employ a fairly small number of words. Comprehension of the underlying Persian words thus presupposes, on the one hand, an accurate transcription into Persian of the words the scribes wrote in Elamite, and on the other, an etymological analysis that can hardly be undertaken without the assistance of the later corpora (various Iranian languages, including Middle Persian and Modern Persian). But etymology alone does not answer

every question, because of the well-known fact that the sense of a word can change considerably over the course of time. A word's etymological meaning must therefore be compared with the context in which it occurs, and then the problems of syntax interfere again. In spite of the loanwords found among the Aramaic documents from Egypt and in the Babylonian tablets, and the terms collected by Greek lexicographers (Hesychius, the *Suda*, etc.), the meaning of a significant number of words used by Elamite scribes serving the Great King still remains unknown or hotly disputed. Meanwhile, it would not be wise to be overcome with skepticism; on the contrary, the breadth of the documentation and the results already achieved drive the historian to interrogate the tablets with both patience and enthusiasm.

Accounts and Archives

The tablets give evidence first of all of the nitpicky, "paper-shuffling" nature of the administrative system established to supervise production and storage. After being gathered in the districts, harvests and livestock were collected in warehouses. Two officials were in charge of each warehouse, one managing the stores (the *tumara* for grain), the other (the *ullira*) authorizing disbursements of merchandise. Each year, the accountants prepared an inventory that they sent to the central office in Persepolis. There also were heads of the warehouses found at each layover on the major routes, where the official travelers could find travel provisions. A duplicate of the records was likewise filed in Persepolis, where the accountants annually registered receipts and disbursements and maintained the books. In principle, then, at any given time, the central authorities were aware of the status of the stores at every location in the territory, and the officials could thus authorize appropriations at this or that warehouse.

Each "county seat" obviously included several warehouses, each one dedicated to the collection and storage of a single product: grains (of various kinds), sesame, wine, beer, wheat, or livestock (sheep, cattle, camels, horses, fowl). The statement of accounts at Hadaran in year 19 lists a total of 2615 BAR [ca. 14 tons] of grain distributed during that year, under 11 categories: distribution to workers (*kurtaš*), to horses, to fowl, to flocks and herds, and delivery to the royal warehouse (PF 1943). At Dur, in year 25, nearly 11,000 BAR [61 tons] of grain left the warehouse (PF 1948⁷⁰⁻⁷¹). Nearly 5,500 liters of wine were appropriated in 503 from the warehouse at Šaramanda (PF 1954). The livestock inventories report each species by sex and age. Under each heading, the accounts give the names of the people in charge of the warehouse along with the name of the administrator who gave the order for disbursement, as well as the amount distributed and the type and number of recipients (priests, *kurtaš*, animals, etc.) and the quantities transported to the warehouses of Persepolis or other sites. Each delivery order coming down the administrative pipeline was sent in a "sealed document" (*halmi*). For example, the record of the grain warehouse at Rakkan, in year 21 (501), mentions 20 *halmi* "signed" by Iršena, one of the chief assessors (PF 1946). Whenever a problem arose, each person's responsibilities were clearly demarcated. Each tablet bore two seal impressions: the seal of the official who provided the merchandise and the seal of the person who received it for distribution. The seals of the highest officials were individualized by an inscription: "Seal of so-and-so, son of so-and-so." In 500, the top official of the administration, Parnaka, let it be known that he had changed his seal: "The seal which hitherto had been mine, this seal has been replaced. From now on, the seal borne by this tablet is mine" (PF 2067-68).

Several documents show that, as elaborate as the system was, it gave rise to disputes. An accountant complains that an official has not provided a sealed document (PF 1957, 1988). There are accusations(?) of “appropriating for themselves” this or that merchandise (PF 1986³⁷⁻³⁸, 2074). In May 498, accountants specify that certain female workers have not received their rations for two months (PF 1960). Sometimes the central administration is asked for help in getting this or that administrator his job back (PF 1859–60; 2071). Though quite obscure in detail, there is a letter stating that “the accountants have not furnished a sealed document”; and “the man who was the courier(?) of the tablet has fled.” The order is given that he be captured and sent to Media(?), where an inquiry will be conducted. The following order is issued to the administrators: “When you send a tablet to Parnaka, write on it the name of the person responsible for its delivery.” It appears, in fact, that previously such precautions had not been taken (PFa 28). The warehouse officials were often called to account. A tablet mentioning the failings of several officials and the adjustments that eventuated ends with this formula: “In conformity with customary law” (PF 1980), where the term translated ‘law’ (Old Persian *dāta*) here seems to refer to administrative regulations.

2. Administrative Hierarchy and Organization of Production

Parnaka

In charge of the entire administration was a man named Parnaka; documents show that he was in charge between 506 and 497. His seal bears the Aramaic legend “Parnaka, son of Aršāma.” It is generally agreed that the Aršāma in question is none other than the grandfather of Darius. Parnaka would thus be the brother of Hystaspes, the paternal uncle of Darius, and the father of Artabazus, whom Xerxes placed in charge of Hellenistic Phrygia. In any case, the size of the daily “rations” he received during his seasonal migrations reveals the eminence of the person and his responsibility: 2 sheep, nearly 90 liters of wine, and nearly 180 liters of flour. Several tablets attest to the large number of letters he sent to his subordinates, most of the time ordering them to release some amount of produce (wine, grain) to specific persons or groups. On two occasions (deliveries to Princess Irtašduna), these letters state that the order came from Darius himself (PF 1793; Fort. 6764). To carry out his duties, he presided over a sizable bureaucracy. Each letter also names its scribe. Several of these letters refer to “Babylonian scribes writing on parchment” who worked directly for him (PF 1807–8, 1810, 1947). A man called Appišmanda may have succeeded him in 497. Several letters, too, were written by the scribes of Ziššawiš, Parnaka’s right-hand man (PF 1811–28, 2069). His seal is applied in the name of Darius. His daily rations of course are lower than Parnaka’s: less than 3 liters of wine, less than 60 liters of flour, and a single sheep.

The Department Heads

Just below Parnaka and Ziššawiš were several high officials, each of whom was in charge of one area of production and to whom Parnaka or Ziššawiš sent regular letters requiring them to do what was necessary for the delivery of specific products. Armed with this letter, the officials in turn sent sealed orders down the chain of command. As far as we can tell, production was organized into five departments: livestock, grain, wine (and beer), fruit, and fowl.

By way of example, let us take a closer look at the livestock department. It was managed by the head of livestock (*kasabattiš*). At least from 506 to 501, the job belonged to a

man named Harrena. In 503, on the orders of Parnaka, who in turn had been instructed by King Darius, Harrena delivered 100 sheep to Princess Irtāšduna, one of Darius's wives, whom Herodotus calls Artystone (Fort. 6764). Each district had a bureaucracy like the one in the central offices. At Uranduš in 503, there was a *kasabattiš* called Makama who reported to Harrena (PF 2025) and was in charge of a number of shepherds and stockbreeders. Since the pasturage proper was insufficient—especially during the harsh Persian winter—it was necessary to plan to provide for additional feed (especially grain) in the warehouse stockpiles. Several documents deal with the collection of grain reserves (PF 432, 465, 495–96, 522, 526–27, 535, 538, 542, 545). Several categories of tablets (S1–S3) record rations provided to animals, including special rations anticipating royal migrations (S3). These texts deal with every category (horses, cattle, sheep, camels, and all sorts of poultry). They always follow the same pattern: on orders from above (often a sealed document [*halmi*]), the warehouse manager delivered grain (for example) to a person entrusted with feeding animals. Regarding horses, in year 17 (505), the second-level administrator of rations was Hiimizza, who, in light of a sealed order received from the top administrator, sent orders to the wine-cellar-master Yamakšedda, who was in turn to deliver wine rations to Maudadda, who was in charge of horses at Parmizzan (PF 1833–34; cf. 1687–91). At this same level, those in charge of local horses were the *mudunra* ‘stablemasters’: they are the ones who received the rations from the warehouse to give to the animals. Other titles sometimes appear—namely, *mudunrabattiš*, *pašanabattiš*, *harmanabattiš*—which are often used synonymously but might just as well refer to an internal hierarchy (cf. *battiš* = **pati* ‘chief’). Reading the individual tablets leads us to believe that each *mudunra* dealt with only a small number of animals. Sometimes this was a single horse, often four or five, rarely ten or more (PF 1635ff.) In every location, there were several horse-tenders. At Rakkān in year 21 (501), rations were entrusted to seven people, whose most common title was *mudunra*. It appears that each *mudunra* was in charge of several groups of horses; one of them, Battišdana, even had to take care of horses, cattle, and sheep (PF 1946).

The rations themselves varied from 1 QA (less than a liter) to 40 QA of grain per day. The horses also received unusual rations: wine (PF 1757–64, 1772–78), beer (PF 1779), grain (PF 1766–68), and flour (PF 1770–71). Provision of wine or beer for horses (even once for camels: PF 1845) is nothing to be surprised about, considering that Aristotle (*Hist. An.* VIII.9) mentions 5 *mariš* of wine as an allocation of elephant feed. This practice is well known in modern times as well. Horses are distinguished by age—“young” and “old”—as well as by function. Two terms are worth mentioning: *pirradaziš* and “[the one] who makes the journey.” Both refer to horses normally used in the postal service. The former are the “express horses,” famous for their speed and endurance. They were used by the “swift couriers,” who were also called *pirradaziš* (chap. 9/2).

The kurtaš Heads (kurdabattiš)

In the Fortification tablets, four officials bear the title *kurdabattiš*: Iršena, Karkiš, Šuddayauda, and Mišparma. The word *kurdabattiš* has received two interpretations: some (the larger camp) think that such people oversaw the laborers who worked in the fields, shops, and construction sites, who in hundreds of tablets are generically called *kurtaš* (OPers. **garda*). Others believe that *kurta-* represents not **garda* but **grda* ‘house’ and thus that the *kurdabattiš* were chief stewards who headed all five departments and their

staff. However, the etymological discussion is of minor importance, since the duties this person assumed clearly lie at the intersection of stock-regulation and administrative staff-regulation, involving one of their most frequently attested roles: distributor of rations. In 494, dates were warehoused in the paradise of Mišdukba, under the supervision of Mišparma, who had the titles *kurdabattiš* and *šaramana*, lower-level administrator/distributor (PF 158). In other words, he would have been responsible for handing out date rations upon receiving an order through channels. In other cases—if this does not involve someone else with the same name—Mišparma was responsible for the stocks of various products that Iršena, also a *kurdabattiš*, quite often distributed for the benefit of groups of *kurtas* (PF 929–32, 1103, 2041). Having the same title did not imply equality of rank: as in the case of the *kasabattiš* (livestock managers), some people could only carry out their functions within a limited perimeter, under the authority of the head *kurdabattiš*. This was doubtless the hierarchical relationship that existed between Mišparma and Iršena.

Iršena was obviously a very busy, high-ranking person. His ancestry is not known in detail, since he reused a Neo-Elamite seal carved with the name of Humban-ahpi, son of Šati-Humban. Nonetheless, he was a Persian (Ršayana) who, one tablet records, came from Anšan (PF 1368). He is named in more than 70 tablets; the dates of the tablets reveal that he was giving orders at least from 505 to 498. His seal impressions show that he operated with privilege in the Fahliyun region, but he can also be found at work in the Persepolis sector. In essence, his brief was chief financial officer. In this capacity, he sent sealed documents (*halmi*) to various subordinates, whose duty it was to allocate the rations according to his orders. Thus, in 503 he sent more than 10 orders to the warehouse at Hadaran, where the managers were responsible to him. He also planned the transportation of grain from place to place and the delivery of various shipments to the king. In 500, some *kurtas* in transit received travel rations at an estate (*imatam*) where Iršena was responsible for the allocation. In other words, it was he who sent the order to the manager of the warehouse (Medummanuš) and to the official (Šiyatiparna) who would receive the grain from him for distribution to the *kurtas* (PF 1368).

Iršena himself was under the authority of Parnaka and his lieutenant, Ziššawiš, from whom he received letters instructing him to take the steps necessary for the distribution of rations to various people (a *magus*, a warehouse manager, Parnaka's Babylonian scribes, etc.). In 498, he also received a letter from Maraza, who ordered him to distribute grain rations to *kurtas* (PF 1844). After carrying out major responsibilities in the wine department between 504 and part of 498, and therefore figuring among Parnaka's staff (PF 1789, 1792, 1806–8, 1840), Maraza then was reassigned to the grain department (1841–42, 1844–45). In his capacity as a high official at this time, he ordered Iršena to distribute grain rations to *kurtas* who depended on him. This simple example shows that the *kurdabattiš* Iršena was not a head steward, in a position in the hierarchy superior to the head of a department. Quite the contrary, on the instructions of the higher authority, he ordered the lower-ranking officials to distribute rations to groups of *kurtas* placed immediately in his responsibility. The same clearly holds for Karkiš and Šudclayauda, who succeeded him in the Persepolis region, the former from 507 to 503, the latter from 502 to 496. The activities of both of them were in principle limited to a particular region, but they also needed to intervene elsewhere, perhaps because of a scarcity of qualified personnel. In any case, study of the tablets shows the complexity and

rigidity of the Persepolis administration's chain of command. It also provides interesting hints about the careers of officials, such as Maraza, who sometimes can be followed for several years.

Treasurerships and Treasurers

The problems posed by another high official, the treasurer, are far more difficult. The only direct information we have comes from the Treasury tablets, which allow us to compile a list of treasurers after 490, when Baradkama took the job, a job that he kept until 466. The Aramaic notes on the Persepolis mortars and pestles allow us to fill out the list of treasurers through 436–435, assuming that the dates proposed by the editor of the inscriptions are fully confirmed, which is not in fact the case. In the Treasury tablets, the treasurer has the Persian title **ganzabara*, derived from the word **ganza* 'treasure'; in the mortar and pestle inscriptions, "subtreasurers" (**upa-ganzabara*) also appear. This may have been Šakka's role alongside Baradkama. Several times treasurers are given the Elamite title *kaṣnuškira*, which corresponds to **ganzabara* (PT 1963^{3,6}). They could also be referred to with the phrases "treasurer of Persia" and 'in the fortress' (*hal-marrīš*), which unambiguously designates Persepolis. Regularly, at the demand of some official, they released funds for the payment of *kurtaš*. Beginning in 493, in fact, the *kurtaš* were paid partly in weighed silver. The silver came from the treasury, in one instance called the royal treasury (*sunkina*; PT 27). The treasurers' area of activity was confined to Persia itself; in most cases, the *kurtaš* were "craftsmen at Persepolis," where they worked on the construction sites. But the treasury could also provide money/silver for groups who worked at other locations in Fārs, such as the workers who made coats of mail at Niriz (PT 52). Despite these data, their place in the hierarchy is not easy to specify precisely. We do not know exactly what the treasury was or what funds were used to replenish it: funds belonging to Persia proper ("treasury of Parša") or funds deriving from levies of tribute and taxes flowing in from throughout the Empire (as may be suggested by PF 1342, 1357, 1495, and PFa 14; cf. Nepos, *Dat.* 4.2 and *DAE* 71–72 [AD 10–11]). Did the treasurer report to a higher-ranking officer? During Baradkama's tenure, nothing more was said of Parnaka or of any successor to his high responsibilities. On several occasions, Baradkama received orders directly from Darius (PT 4–7). Should we infer that a royal letter was sent in every case?

The Fortification tablets seem to reveal a different state of affairs. The word **ganza-bara* is found there only twice. Someone named Mannuya received money/silver at Susa and got orders to take it to Matezziš (PF 1342). Does this refer to the proceeds of taxes levied in Elam? But if so, why take it to Matezziš and not to the Persian treasury in the fortress very close to Persepolis? Another tablet transcribes a statement of accounts set up at Rakkan, which is called a treasury (PF 1947). Among the officials who worked there and received rations there were a treasurer (**ganzabara*); an official in charge of authorizing disbursements of goods from the warehouse (*ullira*), who is called *ullira kaṣnuškira*, 'ullira of the treasury'; and a scribe (*tipira kaṣnuškima*). The treasury in question, however, was not the treasury of Parša but one of the many local treasuries, which the tablets list throughout the territory of Fārs and Elam. One text refers indirectly to the Persepolis treasury. It records the provision of rations to shepherds who brought "royal sheep" to Susa and who were described as "attached to the treasury [of Persepolis]" (*kan-zaika*; PF 1442). This probably referred to *kurtaš* who were dependent on the authorities of the fortress and who were needed for particular jobs (cf. PT 45, 65–67).

The words *kapnuški* 'treasury' and *kapnuškira* 'treasurer' are attested in 53 Fortification tablets. These treasuries were eleven local treasuries in Persia and apparently have nothing in common with the Persepolis treasury known from the Treasury tablets. These treasuries included warehouses and a sizable staff (as at Rakkan). Attached to them were larger or smaller groups of *kurtaš*—for example, 47 at Shiraz in 504 (then 231 in 500), 677 at Matezziš in 497, 544 at Uranduš in 500, and so on. The local treasuries were thus primarily centers of collection, warehousing, and processing of agricultural and animal products. The treasurer of one of these centers thus did not have much in common with the treasurer of Parša (such as Baradkama), even though both of them were known by the same title, **ganzabara*. Baradkama appears several times in 495–494 as distributor of rations to the *kurtaš* of the treasury (*kapnuški*) of Uranduš and Shiraz (PF 864–67); once, grain was in the control of Iršena; in 495, he was responsible for seven *kurtaš* of the treasury at Kurpun. Obviously, between 494 and 490, he profited from a major promotion that had brought him to the Persepolis treasury. There can be no doubt, then, that the treasuries also involved groups of *kurtaš* who worked in shops, as is suggested by the inscriptions on mortars and pestles found in the treasury.

Apparently, Baradkama had no predecessor in his duties as treasurer of Parša, insofar as we can reconstruct the situation from the Treasury tablets. This is not to say that after Parnaka there was no royal treasury in the sense of a depository for metal and valuable objects. As a matter of fact, the ancient authors often refer to such places as *thēsauroi* and *paratheseis* (cf. Strabo XV.3.21). It is always risky to interpret silence in the sources. The sudden appearance of payments in silver to the *kurtaš* in 493 certainly does not imply that Parnaka did not have sums of money at his disposal. The Akkadian Treasury tablet proves, in fact, that from at least 502 on, dues were collected in weighed silver (PT 85). It seems more reasonable to assume that some of Parnaka's archives have disappeared; moreover, the Fortification tablets are extremely discreet regarding the operations carried out at Persepolis itself.

3. The World of Work: The *kurtaš*

Kurtaš Craftsmen

An overwhelming majority of the tablets refer to the rations provided to the *kurtaš*. In the Persepolis documentation, the Elamite word *kurtaš* refers generally to the laborers who worked in the fields and shops controlled by the administration or else on construction sites at Persepolis. In most cases, their specialty is not indicated. They are most often listed as *kurtaš* receiving rations in a certain locality or a certain treasury (*kurtaš kapnuški*). On the other hand, many technical names of occupations are not included, so we have entire lists that are inexplicable (cf. PF 865).

The Treasury tablets basically contain the names of specialized workers in the building trades and ornamental crafts. They are often designated by the expression "*kurtaš*-craftsmen who receive rations from Persepolis." The Elamite word *marrip* 'craftsman' in all probability corresponds to Persian **kmuvaka*. The designation they receive is sometimes very general, such as the 1149 men who are called 'craftsmen of all trades' or 'workers at any task' (PT 79). Their specialty is sometimes indicated more specifically: they work stone, they carve reliefs in wood, they contribute to the completion of a hypostyle hall, they are goldsmiths or smelters. The mass of Treasury tablets attests to the perpetual work on ornamentation and finishing at Persepolis throughout the reign of Xerxes

in particular. In the Fortification tablets, the craftsmen (*marrip*) working at Persepolis are also named, but relatively infrequently. Between 507 and 500, certain tablets record the transport to Persepolis of grain, flour, and wine intended for craftsmen's rations; the distributor is Abbateya (1580–84, 1587, 1594, 1614, 1801, 1831; cf. 1049 and 1953). Ethnic background is given once (Lycians: PF 1049); specialties are cited rarely: sculptors in stone (PF 1587, 1633), goldsmiths (PF 872, 1805), woodworkers (PF 1799?). An Aramaic gloss (PF 1587) refers to quarrymen. One is reminded of the Greek graffiti found in a quarry near Persepolis—one graffiti carved with the name Pytharcus, another Nicias. Furthermore, the mortars and pestles of Persepolis show that, under Xerxes and Artaxerxes I, *kurtas̄* were employed in the fortress's shops to make objects apparently intended for royal tableware.

But not all of the craftsmen were concentrated at Persepolis. The Persepolis treasurer also provided a "salary" to *kurtas̄* who made coats of mail at Niriz (PT 52) or who worked at Fasa (PT 53) or Shiraz (PT 42–42a, 60). Like the treasury in Persepolis, the treasuries scattered all around the territory in fact included groups of 'treasury workers' (*kurtas̄ kapmuškip*) of varying size. A wide variety of trades is found among them: masons at Uranduš (P11' 27–33, 67–68), Sardian blacksmiths at Kurra (PF 873), and goldsmiths at Hidalu (PF 874). Among the most specialized groups were the *kurtas̄* to whom the administration delivered skins, which they treated to make parchment, which in turn was used by the many chancelleries and accounting offices. Furthermore, 23 texts from various sites refer to groups of *pašap* consisting entirely of women. These were (probably) weavers who worked wool and made a wide variety of clothing.

On the orders of Abbateya in 497, a group of 31 *kurtas̄* from the Niriz treasury came to Persepolis, where they worked as masons (PF 1852). These *kurtas̄* were not necessarily master masons previously; it is possible that they had been summoned as common laborers and enrolled as workers in squads intended for masonry works. It appears in any case that groups of workers were periodically moved from one spot to another as needed. Such movements are frequently attested in tablets from Category Q (travel rations): from Susa to Persepolis, from Susa to Makkani, from Persepolis to Susa, from Rakkan to Tammukhan, and so on. Relocation of workers is also mentioned in the Treasury tablets. At the end of Darius's reign, construction workers, who were used in the building of a palace at Nupistaš (Naqš-i Rostam? PT 9), were brought from Egypt; in 462–461, a renowned specialist in stone ornamentation was ordered from Susa to Persepolis (PT 78). The groups moved in this way could be sizable: 547 Egyptians from Susa to Persepolis (PF 1557); 108 Cappadocians from Persepolis to Elam (PF 1577); 1500 men from Persepolis to Susa (PF 1542); 150 Thracians, 980 Cappadocians, and 303 Lycians from one place to another within Fārs (PFa 18 and 30); etc.

The change in the number of *kurtas̄* on the same site is further evidence of the practice of worker relocation. The orders for distribution of rations in effect allow us to compile an annual census. We can see that some of the treasuries had only small groups attached permanently, such as Hiran (except in 488: 88 *kurtas̄*), Kurpun, and even Pasargadae. On the other hand, at Matezziš, rations were distributed to 259 workers in 506, 694 in 499, 702 in 498, and 677 in 497; at Uranduš, the figures are as follows: 15 in 503, 544 in 502, and an average of more than 200 until 497. The variations are sometimes striking: at Parnizzan, where there regularly were very small groups (5 in 505 and 6 in 501), the number reaches 527 in one year (508?). To be sure, the figures must not be

taken as a precise reflection of the circumstances, because the archives we have are incomplete and, in particular, they fall silent regarding the number of craftsmen working at Persepolis. Nonetheless, they give an overall idea of the hierarchy of the treasuries and of the movements of laborers from site to site.

Centurions and Foremen

The orders concerning rations and movements of *kurtas* emanated from 'heads of *kurtas*' (*kurdabattis*), who also might carry out the duties of distributors (*šaramana*). Orders could be sent directly from Parnaka's office, sometimes even from the royal chancellery itself. But the groups of *kurtas*, in particular the best supplied, had their own internal organization, subject of course to the authority of administration officials. Several times in the Fortification tablets products are directed to 'heads of a hundred' (*sadabattis*/'*satapati*) and 'heads of ten' (*dasabattis*/'*daθapati*), explicitly named according to the formula "the decurion/centurion of such-and-such" (PF 138–43). A 'head of four' (*zatturubattis*) is even found once (PT 1963: 10). One Treasury tablet records a list of persons (*taššup*/people) divided into hundreds (PT 84). We are tempted to think that it was the job of these centurions and decurions to distribute the rations among their men. Nonetheless, the information drawn from the Treasury tablets does not fully confirm this interpretation. In some exemplars, the centurion is indeed the distributor (*šaramana*; PT 42–42a, 53, 60). But this is not the rule. In 483–482, a group of Syrian, Egyptian, and Ionian *kurtas* working at Persepolis comprised 201 units in all. The rations were divided unequally among subgroups comprising 46 men each, obviously because of their differing qualifications. The group also includes 63 men called centurions and subcenturions. If we suppose (which is only logical) that each tablet deals with a specific category of workers who received rations, it is obvious that each of the centurions (however many there were) did not command 100 men. They are called more precisely "centurions who [belong to the category] of centurions." This is probably a distinction that entitled one to a larger ration than the 138 other workers (PT 15). This was probably also true for the Egyptian centurion Haradduma, a carpenter/joiner, who in one tablet is the only person specified as receiving a ration (PT 1). He must have been an especially respected craftsman, considering the amount of his ration (the equivalent of 6½ siculi per month), which was much higher than that of other centurions (1 + ¾ + ⅛ siculi per month for each of the 63 centurions and subcenturions of PT 15). It was also much higher than the ration of a particular decorator who, even though he was specially summoned from Susa to Persepolis in 462–461, received only ⅓ sículus per month (PT 78). The modesty of his ration seems all the more inexplicable in that he is called *pirra-manakurraš*, which represents the Persian **framanakara*, which is translated 'foreman'. In 466–465, a man named Eškuš was the foreman of 612 carpenters working at Persepolis, but the amount of his ration is not stated (PT 75). In 466, two carpenters' foremen received an allocation of 1⅓ siculi per month (PT 44).

Food Rations and the Organization of Production

According to the Fortification tablets, rations in kind were distributed unequally according to gender and age. In general, men, 'boys' (*puhu*), women, and girls were distinguished, although some uncertainty remains about the exact meaning of *puhu* (defined by age? or by status [servant]?). In an overall analysis, it appears that 83% of the men received 30 QA of grain per month, or about 16.5 kg (figuring 56 kg per hectoliter), the

others receiving between 11 and 25 kg; 87% of the women received between 11 and 16.5 kg, nearly all the others drawing 22 kg. But these mean figures do not take into account the diversity of situations. By way of example (among hundreds more), let us consider the amount of grain rations handed out in March 498 to 702 *kurtas* in Matezziš, who received 1,638.5 BAR, that is, more than 100 quintals (PF 960 [1 quintal = 100 kg]). The allocation was as follows:

1 man	27.50 kg	4 women	27.50 kg
48 men	22.00	120 women	22.00
31 men	18.75	146 women	16.50
23 men	16.50	100 women	11.00
15 "boys" (<i>puhu</i>)	13.25	3 girls	13.75
28 "boys"	11.00	13 girls	11.00
38 "boys"	11.00	43 girls	8.25
20 "boys"	5.50	22 girls	5.50
22 "boys"	2.75	17 girls	2.75
		8 <i>libap</i>	11.00

We can see differences within each category as well, without in any particular case having any information to help understand the criteria (aside from age, which is clearly not the only consideration). Furthermore, a new category appears here, the *libap*. The *libap* are often mentioned in groups of travelers who are supplied from the warehouses on the royal roads. Two subgroups can be very generally distinguished, the *šaluiš* and the *libap*—two categories that correspond to different social statuses but are not defined further—the "gentlemen" and the servants/slaves. The gentlemen usually receive 0.82 kg per day, the *puhu* 0.55 kg, and the servants/*libap* 0.55 kg as well.

While grain was obviously the staple food, some groups also received wine or beer, but this is relatively rare: less than 1/5 of the cases. In March and April 500, for example, 24 *mariš* of wine (ca. 228 liters) were distributed to 8 *kurtas* of Niriz, as follows: 19.4 liters for each of 2 men, 9.7 liters for each of 2 other men, and 23 liters for one woman (PF 878). We can conclude from these two examples that the women were not systematically less well provided for than the men. The ration of three *mariš* of wine (29 liters) is regularly allocated to women who bore the title *iršara*, which renders the Persian *madista* 'head'. This title could obviously be applied to men, who therefore received very high rations. But there were often women heads of women *pašap*. These women heads received a very high grain ration of 27.5 kg. On one occasion (PF 1790), 5 of these women received 1/2 sheep; on another, 544 ordinary female workers of Uranduš earned 1/30 sheep per month (PF 1794), even though the distribution of meat to *kurtas* is extremely rare (PF 823–25, 1793). The *kurtas-pašap* were among the groups that received supplementary rations: one liter of flour per month in one case (PF 1090) and 3 liters of beer for six months in another (PF 1108). Even within the group of weavers—a small number of whom were male—the rations were divided into three subgroups according to job, whether the garments being made were of a more or less fine fabric or texture (superfine, very fine, or other). It was probably the same on the construction sites at Persepolis: it seems quite likely that the work there was divided according to squads and teams, each one assigned to a specific repetitive task.

The Aramaic inscriptions from Persepolis also attest to the administration's efforts to keep close watch on the *kurtaš* and to increase their productivity. These inscriptions, on dishes, pestles, and mortars of green stone ("green chert"), are composed on the following model (according to one of the proposed interpretations):

IN THE TREASURY OF THE FORTRESS
ON THE ORDERS OF X, SEGAN
N MADE THIS MORTAR/PESTLE/DISH
WHICH HE TURNED
ON THE AUTHORITY OF Y¹ (TREASURER) AND/OR Y² (SUBTREASURER)
SERIES (OF WORK) OF YEAR A

The procedure can be reconstructed as follows. Workshops for stone vessel-making (doubtless intended to adorn the royal table) were located in rooms in the treasury. Craftsmen whose status is not specifically indicated but who clearly fell under the generic category of treasury workers (*kurtaš kapnuškip*), found so frequently in the tablets, worked there. Some of them, the turner-polishers, were specialists. The *kurtaš* teams—perhaps grouped into decuries (tens) or centuries (hundreds)—were directed and overseen by *segan* 'provosts/guards' who themselves were under the orders of the treasurer ("ganzabara) and the subtreasurer ("upa-ganzabara) then in office. The notices written on each object allowed the administrator to verify (and doubtless pay for) the labor of the workers who were involved in the production. They also allowed him to establish a correlation between the weight of stone provided to each workshop and the number of objects produced, thus providing a means of measuring the output. The mention of the date and the serial number confirms the meticulous, detail-oriented character of the administration of the treasury, so clearly attested throughout the Persian documentation. And, were it not marked by an obvious flair for the dramatic, we would not hesitate to use a passage from Diodorus of Sicily to illustrate the administration's concern for "efficiency" (XVII.69.4♦). According to Alexander's historian, as a matter of fact, the Greek *kurtaš* of Persepolis were treated in this way: "They were persons who had acquired skills or crafts and had made good progress in their instruction; then their other extremities had been amputated and they were left only those which were vital to their profession"!

Origins and Status of the kurtaš

We have still not explained the status of the *kurtaš*, and to do so is no easy task. The etymology of the term (*garda*) is not much help. Only context might allow us to attempt some semblance of a description. The first observation is that the *kurtaš* represented a sampling of nearly all of the peoples of the Empire, including Persians in apparently limited number. Among the *kurtaš* were Bactrians, Sogdians, Babylonians, Assyrians, Elamites, Arabs, Syrians, Egyptians, Lycians, Carians, Ionians, Sardians, Cappadocians, and Thracians. The occurrences of these different peoples vary in number: while Carians are named only 3 times (PF 1123; PT 37, 1963: 2) and Arabs only 4 (PF 1477, 1507, 1534; PFa 17), others appear in many tablets, especially Lycians (more than 10 times) and Thracians (at least 20 times). But it seems difficult to draw inferences from statistics based on such fragmentary archives.

Why did they come, or why were they brought, to Persia? There is no single answer, and several compatible explanations can be offered. The policy of deportation of conquered populations is attested several times, as it was in the Assyrian and Neo-Babylonian periods (for example, the Judahites under Nebuchadnezzar). After the defeat and

destruction of Sidon in 345–344 by Artaxerxes III, men and women of the city were led captive to Babylon, where “they entered the royal palace” (ABC no. 9, p. 114). The Classical texts frequently refer to this practice, which the Persian generals sometimes use as the ultimate threat (Herodotus VI.3, 9, 94). The Milesians were subjected to deportation (VI.32, 98), as were the Paonians of Thrace (VI.98), Barcaeans (IV.204), Eretrians (VI.101, 119), Boeotians, and Carians, not to mention the Branchidae of Miletus who, fleeing Miletus during Xerxes’ predations, were settled in Bactria. No document expressly names Persia as a destination to which deportees were sent. They mention instead what the Greeks liked to call “the extremities of the Empire”: Bactria, Babylonia, Elam, as well as the islands in the Persian Gulf that were frequently a place of deportation, as much for miscreant Persians as for conquered populations. But there is no doubt that prisoners of war could be settled in Fārs. Alexander, upon his arrival in Persia in 331, made contact with Greeks deported to Persia, as well as with a Lycian shepherd, who told him he had been reduced to this condition after a defeat. We are immediately reminded of the *kurtas* shepherds known from the tablets. The same is true for the Greeks in Persepolis who “had been carried away from their homes by previous kings of Persia” (Diodorus XVII.69.3♦) and who, mutilated by their masters, complained to Alexander of having been forced to toil in slave workshops (*ergastules*; Quintus Curtius V.5.13).

Quite another picture emerges from the “foundation charters” of Darius’s palace at Susa (chap. 5/2). There the king is glorified for bringing raw materials and specialized craftsmen—Ionians, Sardians, Egyptians, Carians, Bactrians, Elamites, Babylonians—from everywhere. Despite the deeply ideological character of these royal proclamations, we can easily agree that Darius utilized ethnic contingents whose specialties were well known. This selective use of specialists is well known from the Neo-Assyrian kings. There is also no doubt that to accomplish his construction projects at Pasargadae, Cyrus himself called on craftsmen from Lydia and Ionia. According to Diodorus Siculus (I.46.4♦), it was the same with Cambyses, who, not content to pillage the temples of Egypt, “[took] artisans (*technitai*) along from Egypt, [and] constructed their famous palaces in Persepolis and Susa and throughout Media.” It is unfortunately difficult to confirm whether the ethnic groups mentioned in the tablets were specialized in a particular activity. Though it is true that Babylonians were employed as scribes who wrote on parchment by Parnaka, this was not their only activity. Other Babylonians were “seed merchants” (PF 1811, 1821–22) and still others gravediggers (? PF 1856). Among the Carians, some were stoneworkers (PT 37) and others masons (PT 37, PT 1963: 2). The Egyptians and Syrians worked in various building trades: masonry, carpentry, sculpting, etc. If we add the fact that groups of *kurtas* were sometimes ethnically mixed, we see that any conclusion regarding ethnic specialties becomes useless and illusory.

The individually named craftsmen constitute a special case, such as, for example, the Egyptian foreman specializing in woodworking who was employed at Persepolis in 490–489 (PT 1) or the decorator foreman who was called posthaste from Susa to Persepolis (PT 78). It is tempting to suppose that some master craftsmen/artists might have come to Persepolis not because they were forced to but because they were requested by Persian officials seeking especially skilled technicians. This was perhaps the situation (later) in the case of the sculptor Telephanes of Phocis, mentioned by Pliny (NH XXXIV.19.68), and many other famous Greek artists in various fields (athletes, poets, dancers), even if

some of them (the physicians Democedes and Ctesias) were captives. This hypothesis implies that at the end of their engagement (contract?), they could return home or seek another situation. Meanwhile, this process—if it can be proved—could only have worked for a very limited number of highly skilled craftsmen. There was no real labor market (see below, chap. 11/9, the case of Hinzanāy). There must be other explanations for why thousands of *kurtaš* with no particular qualifications other than what was assigned to them were, for example, temporarily moved to the construction sites of Persepolis, where most of them carried out repetitive tasks that involved no particular creativity.

Demographics and Population Growth

Women about to give birth were among the recipients of special rations (PF 1200–37,]248). Although the term *kurtaš* is not always qualified, there is no doubt that it often refers to women workers, whose specialty is sometimes indicated: for example, weavers (? PF 1200, 1203, 1236; cf. 1224). From time to time they are listed by name. They generally receive wine, beer, and flour. The ration is doubled in the event of the birth of a boy: for example, 10 liters of wine or beer for a boy, 5 liters for a girl; 11 kg of grain for a boy, 5.5 kg for a girl. Some mothers are rewarded with higher allocations (*kamakaš*: 15 liters of wine in one case), for reasons we do not know. Several tablets show that each mother received both wine/beer and grain products. Even though the sample is limited in number and timespan (most of the tablets come from 500–497), it is interesting to observe that the total number of births is 449, 247 of them boys (55%). There do not seem to be any examples of twins. Nevertheless, this documentation testifies to a policy of voluntary supplements on the part of the administration—well attested also (in a quite different political context) for Persian families themselves (cf. Herodotus I.136; Strabo XV.3.17). It is clear that these postnatal rations were over and above normal rations—as it were, a reward. At the same time, the bonuses must have allowed the women to recuperate from childbirth under good conditions and doubtless to nurse their babies—if we suppose that the ancients thought that lactation was optimized by drinking beer!

These documents also show that some of the *kurtaš* of Fārs were quite simply a result of natural population growth, since doubtless the status of mothers was passed on to their children. Unfortunately, we know nothing about the fathers. The actual origin of the mothers is rarely specified: Thracians in one case (PF 1215), Ionians in another (PF 1224). But were the fathers Thracians or Ionians? We may return to the Lycian shepherd who guided Alexander toward the Persian Gates, “whose father was a Lycian, and his mother a Persian,” Plutarch states (*Alex.* 37.1♦). There were *kurtaš* who at that time worked in the ‘slave-prisons’ (*ergastula*) of Persepolis, whose representatives referred to women “whom chance and necessity have joined to [them]” and who had given them children “whom slavery has compelled [them] to acknowledge” (Quintus Curtius V.5.15, 20♦). But can we also apply these details to the Persia of Darius I, and would these accounts then describe a current practice? The Babylonian Chronicle on the taking of Sidon by Artaxerxes III and the Greek texts show that the groups of deportees included men and women.

But what became of the young children? Were they permanently integrated into a group of *kurtaš* that included (hypothetically) their fathers and mothers? Fortunately, we have—as we have seen—a very large number of ration tablets that record amounts differentiated by age and sex, according to categories generally understood as men, women,

boys, and girls. On the basis of these documents we can derive some statistics. Taking into account all of the Fortification tablets, M. A. Dandamaev has drawn up the following table:

Total	Men	Women	Boys	Girls
21,576	8,183	8,564	2,687	2,142
100%	37.5%	39.8%	12.7%	10%

Observing that the numerical rations of men to women and boys to girls are approximately equal, the only conclusion that seems possible is that the *kurtas* lived in families. But the reasoning is not airtight. First of all, the fertility rate seems abnormally low, even if we allow for high infant mortality (cf. Ctesias §49). It also needs to be stressed that any conclusion based on overall percentages has no probative value, since it assumes that the *kurtas* constituted a fixed, autonomous, and homogeneous community—which was obviously not true. In fact, if we are to inquire into family structure, we must actually analyze the composition of strictly isolated groups of *kurtas*.

We observe first of all that many *kurtas* did not have equal numbers of men and women. This is particularly true in the case of the treasury weavers. In 14 tablets from 5 sites, dating between 501 and 496, the percentage of women in the groups is between 63% and 73.5%. The increase in the number of women and children is still more impressive if we take the example of the treasury of Shiraz. We see that a recruitment took place in 505 and then again between 502 and 499. In the first recruitment, the number of men remained unchanged, while the number of women and children grew from 6 to 18. Between 502 and 499, the number of children increased from 16 to 99. Women and children thereafter represent some 90% of the total. This new recruitment led to a reorganization of labor in the group. One tablet shows that the group was divided into 11 subgroups: 6 consisted of men only and 5 of women only, sometimes mixed with a few men. It seems clear that these changes are not due to demographics but to decisions made by the administration, which was interested in increasing productivity by establishing a sexual division of labor. In this reorganization of labor, we presume that women and children were separated from fathers. However, there is also nothing to show that the women were the mothers of the boys and girls who worked beside them.

It also appears that the percentage of children is sometimes abnormally low. One text lists a group of Carian goldsmiths: it includes 27 men, 27 women, 13 girls, and 3 boys (PT 37). Even if we assume (without any proof) that these Carians comprised 27 couples, it is no less true that the proportion of boys is inexplicable, because the texts recording the rations given to the mothers indicate that the number of boys born is slightly higher than the number of girls born. We can multiply the examples of imbalance: there was not one girl in a group consisting of 70 men, 95 women, and 20 boys (PF 951); 103 men, 364 women, 122 boys, and 84 girls composed a group from Matezziš (PF 959; cf. 960); 250 men, 220 women, 18 boys, and 32 girls appear in a group of Thracian *kurtas* (PF 1010); a group of craftsmen on the construction sites of Persepolis in 466 consisted entirely of 501 men (PT 74).

Let us now consider an aberrant (in the statistical sense) case. It concerns the Persian boys (*puhu*), labeled *kurtas*, who “copied texts” at Pittaman and who in March and November 499 received grain and wine rations at the order of Šundayauda (PF 871 and

1137). Apparently, these boys or young men were removed from their families and assembled at a location where they learned the rudiments of the scribal trade. We also see that between March and November their number shrank from 29 to 16 and that within the group there was a hierarchy of rations. It is also true that, in the same year in the same place, two tablets record a group reporting to the same officials that consisted only of men and women (PF 903–4). But we must resist the temptation to see these men and women as the fathers and mothers of the Persian *puhu*: the group in fact comprises just one man and four women. And, what happened to the daughters?

Even though the (sole) reference to the wife (*irtiri*) of a *kurtaš* (PF 999²⁴) might possibly lead us to believe that marriages were recognized by the administration, the notion of *kurtaš* living in families must be given up entirely. This simple observation offers much toward comprehending their status. It is in fact clear that the administration was not satisfied with just moving the groups of *kurtaš* from one place to another within the territory. In order to increase productivity, it broke family units or forbade their creation (if any were actually recognized by the authorities). The tablets also show that the bond between mother and child was not permanent. While we might suppose that a mother kept her child near her for the first few years—be it only in apprenticeship to a trade—the texts also prove that the children or youths were taken to other groups that could themselves be broken up according to the needs of personnel management, however these needs were defined by the administration.

Finally, the overall deficit in youths (both male and female) makes us think that some of them may have been sent to court to be turned into palace slaves—on the model of the Colchians and Babylonians, who every year had to send 100 boys and 100 girls (Colchians) and 500 eunuch boys (Babylonians) to the king (Herodotus III.92, III.97). There can be no doubt that the various departments of the Achaemenid court included a large number of slaves. Furthermore, the category of royal slaves (*arad-šarrūtu*) is well known from the Babylonian texts, which, for example, mention a slave of Cambyses (before his accession); we also know the category of palace slaves (*arad ekalli*). The Akkadian Fortification tablet (Fort. 11786) includes a clause under whose terms the seller attests that the slave he is selling is not a royal slave (or a free citizen or an oblate), a standard clause in this sort of transaction, but it merits special attention because the tablet was composed in Persia.

Family Breakup and Ethnic Uniformity

A final(?) difficulty remains. The presence of several ethnic groups at the same site is well attested: for example, Lycians and Thracians at Rakkān (PF 1946), where we also find Cappadocians (PFa 30). Among the groups of *kurtaš*, a very small number comprise members of different ethnic groups: Lycians and Thracians (PF 1006, 1172, 1823), Lycians and Bactrians (PF 1947), Egyptians and Assyrians (YBC 16813), to which may be added a group of craftsmen at the construction sites at Persepolis, where side by side one finds Ionians, Syrians, and Egyptians (PT 15). In these groups, the rations are divided according to the traditional categories (men, women, boys, and girls), not by ethnic background. Very generally, then, groups of *kurtaš* for which ethnicity is indicated remained homogeneous. It is tempting to conclude that, while the administration separated parents and children, it did not make a parallel attempt to dilute their collective identity. But is ethnicity an absolute criterion for cultural homogeneity? Doubt on this score is not unreasonable.

Based on analyses of communities of foreigners settled in Babylonia, it is generally agreed that these communities maintained considerable internal cohesion, because the Achaemenid authorities recognized their traditional structures and their cultural peculiarities, particularly their religious practices. How was it in Fārs? Examination of tablets concerning rations given to attendants of various religions shows that the Persians permitted the growth of faith in gods other than their own gods—even though the proportion of Persian deities is overwhelming. The attendants of Elamite gods (Humban, Napiriša, Šimut, Napazapa) and Babylonian gods (Adad, 𐎠) also received rations. Sometimes the rations were given “for the gods,” without specifically identifying them. In most cases, products were intended for several gods, and it is not unusual to find rations distributed jointly to attendants of Iranian and non-Iranian gods (PF 338–39, 1956). This may indicate that at some locations there were sanctuaries for both.

Sanctuaries honoring Elamite gods are found in many geographical regions; this is easily explained by the antiquity of the Elamite population in Anšan and the activity of Elamite scribes in the chancelleries. They are found especially in the northwest, of course, which amounted to a veritable Elamite enclave, as is confirmed by the use of Elamite month names for dating documents. The distribution of Babylonian gods is very similar, except that they are less frequently attested. It is generally recognized that the record once more illustrates what we may call the religious policy of the Achaemenids, who were careful not to undermine the religious beliefs of their subjects.

On the other hand, we know nothing of the religious practices of the *kurtas*. One tablet shows that the *kurtas* could participate in religious festivals (PF 337). It says: “80 BAR of grain, at the disposal of Bakamira. Bakabana, the priest, received this grain and used it for the religious ceremony: 40 BAR for Ahura-Mazda, 40 for the god Mišduši. Then the *kurtas* ate it. Year 22.” But what is the significance of the presence of *kurtas* at a festival in honor of Persian gods? Were these Persian *kurtas*? Or were nearby *kurtas* simply called together to participate in a festival and the distribution of rations that went along with it? We have no references to Greek, Cappadocian, or Syrian gods. Considering the fact that more than 120 (of the published) Fortification tablets are concerned with priests, gods, and services, it is hard to imagine that the absence of gods other than Iranian, Elamite, and Babylonian deities is due to chance. Nor is there any reason to believe that the Persians forbade the *kurtas* to honor their traditional gods. However, the available evidence strongly suggests that the administration did not provide grain or wine for their sacrifices.

It thus appears justifiable to consider the example of Elamite and Babylonian religious practice a special case. We must also ask: were the Elamite and Babylonian sanctuaries intended for *kurtas*? The answer is not clear. The existence of homogenous groups of Babylonians in Persia is well documented. As early as Cambyses' reign, there is evidence of businessmen coming to borrow money and trade in slaves at Matezziš (chap. 2/7). The Akkadian Fortification tablet clearly confirms this point. Though written in Persia, it uses the traditional Babylonian model, and the very titulary of Darius is Babylonian: “Darius, king of Babylon, king of the lands” (Fort. 11786). It shows that the Babylonians of Persepolis preserved a certain ethno-cultural homogeneity. It must again be stressed that the Babylonians portrayed in the Akkadian tablets were not administrative workers; they were free men. Some probably came to Persia to look after their businesses; others came and went from Babylonia to Persia to make deals, just as they would go to Ecbatana or Susa.

This was certainly not the case for the great majority of groups of *kurtas̄*. Unlike some “Medizing” Greek communities, the Lycians, Cappadocians, and other Syrians did not move voluntarily to Persia, where they clearly had no autonomy within a system that denied them individual and collective liberty. The administration’s vocabulary is quite revealing in regard to the Persians’ opinion of them: groups of *kurtas̄* constituted an undifferentiated labor force that the administration intended to exploit unhindered. All in all, this was a situation much closer to slavery than the “helot” type of rural dependency, a system in which the local peasants (the *laoi* of the Hellenistic inscriptions) continued to live in their villages with their families and continued to own property.

4. Agriculture: Produce and Levies

Baziš and Other Levies

One category of tablets refers to the receipt of sheep and goats, paid as a tax called *baziš* (PF 267–73). The texts include the number of animals, specified according to kind, age, and sex. The name of the administrator responsible for receiving the animals is also given. In several other tablets we can distinguish two people with the same name, Makama, who can be distinguished by their patronymics: one was the son of Nappunda (PF 268); the other, the son of Wuntiš, held office at Pirritukkaš (PF 269–70). The name appears in an account book (PF 2008) that lists the number of animals received by Makama, who reported to Harrena, in years 15 and 16 (507 and 506). He also appears in an account of year 19 (503), where he has the title ‘head of the herds’ (*kasabattiš*) at Uranduš (PF 2025). There he received 526 animals turned over to him by Raubasa “and his companions.” A man named Umizza, a shepherd, received 48. The previous year (504), Umizza, there called royal shepherd at Hiran, was named in a letter sent by “Raubasa and his companions,” by order of Parnaka, to persons who are not clearly identified (PF 2070).

In this letter, Raubasa and his companions have the title “payers(?) of the land(?)” For all its (major!) obscurity, there is no doubt that these men were subject to levies. The text also indicates that they were in charge of *bazikara* (*baziš* collectors), whom they sent into various districts. In other documents, the circumstances remain obscure and difficult to interpret. The word *bazikara* appears in two later tablets (466). In one case, a *bazikara* distributes rations to *kurtas̄* (PT 54). In another document, some *kurtas̄* are called *bazikara* and receive a salary for their services (PT 41). The *bazikara* (Elamite *matira*) received grain, sometimes explicitly designated for “the royal cattle.” For instance, it was a *bazikara*, Kaupiya, who in the same year at Hadaran twice set aside the grain intended for “the royal cattle” (PF 1943, PFa 32). Kaupiya was obviously an important member of the livestock-rearing administration, since on several occasions he delivered sheep to high-ranking persons and to the king (PF 663, 678, 696). The size of the rations awarded to him (PF 843, 1323) shows that he was a high-ranking official. Do these references mean that the *bazikara* were in charge of overseeing the royal flocks and herds (above the shepherds) or that *baziš* was also levied on other animal products as well as agricultural products (which would help us interpret Raubasa’s title)? It is hard to know.

It should also be observed that in a warehouse account from Kurkarraka, the title of an official, *rušdabaziš*, appears; this title can be understood as ‘levier of tax on land’ (PF 1968). The levy of grain deducted for him corresponds to $\frac{1}{10}$ of the total. The existence of a tithe is also verified by several tablets referring to wine (PF 1953–54, 1997–2001).

Every year a portion of the warehoused amount was set aside as a "tithe." On one occasion, the word 'tither' (**daḥaiya*) is associated with grain, and the administrator concerned was "named by the king" (PF 1942). In another example, a series of tablets (PF 546–653) mentions the collection of produce (grain, wine, fruit, and sesame) levied in the villages and collected in a warehouse before being transferred to another warehouse probably located in the heart of the district. Part of these levies ($\frac{1}{10}$ for barley, $\frac{1}{30}$ for sesame) was then set aside for seed or for animal feed. Finally, one series of tablets (PF 48–49, 388–96, 428) records the transportation and delivery of various products (wine, various kinds of grain, and sesame). The word for their destination is *ukpiyataš* (**upa-yata*), which refers to payments in kind; in Babylonia there also was a tax called 'transportation of payments in kind' (*zebēlu ša upiyāta*), probably intended for the king's table. On one occasion, the text is a little more specific: "300 BAR of grain-*tarmu*, at the disposal of Babena, received by Manna-Kitin in his capacity of(?) royal *ukpiyataš*. Year 28. He made beer from this grain" (PF 428).

The Levy of Animal baziš

Taken in conjunction with other accounts of sheep and goats (PF 2007–12), the documents listing the animal *baziš* invite us to attempt a reconstruction of the various ways that animals were levied, despite major uncertainties that cannot be resolved. The clearest (or least obscure!) text is the previously mentioned letter from Raubasa and his companions (PF 2070) that lists the *baziš* collected in the district of Hiran. It seems that Umizza, the shepherd "who lives in Hiran," was required to collect 48 head of sheep and goats that were entrusted to him by Raubasa. Whatever the case, it is remarkable that the following year he received the same number of animals that Raubasa and his companions had previously entrusted to him (PF 2025). Only the proportion of males and females changed. This seems to imply that each district was assessed the same number of animals each year. Four individuals—including a woman—paid 5, 5, 8, and 9 sheep and goats, respectively: they were attached to (dependents of?) the 'estate' (*irmatam*) of Mitrna (Gk. Hydarnes). Two other persons paid 15 and 6 animals: one was a treasury worker (*kapnuški*; from Hiran?); the other was called a "*kurtaš* of the king." It thus seems that sheep and goats were paid as *baziš* 'tribute' each year. Part of the total received was consigned to shepherds (e.g., Umizza) and part to the 'head of herds' (*kasabattiš*) of the district (e.g., Makema). Some animals could be sent to Harrena, the head *kasabattiš* (PF 271). They could be moved long distances, since two tablets mention the transportation of *baziš* to Susa (PF 57, 1495). According to the second tablet, 32 men received travel rations for this purpose: by order of Bakabaduš, they transferred Undana's *baziš* to Susa. These two officials are attested elsewhere as administrators in charge of sheep and goats (PF 62–66). Both were in charge of sheep and goats sent to treasuries.

In fact, another series of tablets (PF 58–77) records the delivery of skins (primarily sheep and goat, but also camel) to treasuries, where they were processed. In the accounts, these are the animals that are listed separately before being slaughtered on site. The hides were then sent to the treasuries under the supervision of officials. Wool probably also came from this source, to be worked by *kurtaš* specialists. The animals that remained alive were raised on the spot by *kurtaš* (cf. PF 848, 1142). The existence of *kurtaš* shepherds is actually attested in several Treasury tablets, which mention two groups: one with more than 370 individuals (men, women, boys, and girls) and the other with 131 (PT 50, 61; cf. PT 1963: 13). Shepherds (*batera*) are also mentioned here and there in

the Fortification tablets. We also know of Lycian shepherds who were working near Persepolis when Alexander arrived. We may note that the management of other fauna, such as cattle (PF 2085–86) or fowl (PF 1721), followed the same pattern. The accounts of the Barniš station in particular show that cattle were also divided into various groups: those to be slaughtered, those to be kept alive on the spot, and those to be entrusted to shepherds (*batera*; PF 2013; cf. 1947, 2085, 2087).

The Akkadian Treasury tablet gives us a handle on the extent of the gaps in evidence and on the extent of our ignorance (PT 85). In this text, in fact, we can see that, after the end of 502, a tax (*mandattu*) was paid in weighed silver by three people: (1) a woman named Indukka, mother of Tutu, 'head merchant' (*tamkāru*); (2) Pattemidu the Mede, "son of the shepherd"; and (3) N, "shepherd." In some tablets, the word *baziš* is replaced by the Akkadian word *mandattu*, which in general designates a mandatory tribute assessment. We know that this is also the word used by Aršāma—along with the word for treasury (*ganza*)—for the amount of "taxes/fees" levied on his Egyptian estates and the estates of two other Persian nobles (DAE 71–72 [AD 10–11]). In the Behistun inscription, *mandattu* is the translation for *baziš*. Of course, *mandattu* and *baziš* are semantically too flexible for us to conclude that Pattemidu and the anonymous shepherd settled the animal *baziš* tax in weighed silver. In any case, PT 85 at least proves that, at Persepolis in 502, two different professional categories—including one or two shepherds—paid their taxes in siculi of weighed silver—a fact that cannot be gleaned from any of the Elamite Fortification tablets.

The Direct Producers

Because of its allusive character, the documentation does not answer an outstanding, haunting question: who paid these different taxes? That is, who grew the produce?

The first thing that needs to be said is that—aside from the shepherds (above)—there are very few explicit references to *kurtaš* dedicated to working the land, although there must have been many in the fields and farms. Since, for example, *kurtaš* received seed from the administration several times (PF 123, 463, 484, 508), we can conclude that they were farmers. There can no longer be any doubt that the labor of cultivation in the paradises required a considerable workforce (PFa 33). But the word 'farmer' itself is absent or not yet recognized in the record. The references to 'nurserymen' (*maršaparra*) or 'irrigation specialists' remain hypothetical or even seriously disputed, since the second of these words is sometimes understood as 'spinner/weaver'. Some Aramaic glosses provide complementary details. In one tablet (PF 855), rations were distributed to *kurtaš* called *pirasanaš*: the Aramaic inscription says "rations for millers." The reason for this surprising lack of references to farmers is not easy to determine. Perhaps the agricultural workers lived off part of the harvest and so did not receive rations, or at least the rations were not recorded by the administration. On the other hand, the situation was different for the *kurtaš* who worked at processing agricultural products: winemakers, brewers, millers, oil-pressers, bakers(?), and those who were used in the warehouses or to transport the products from place to place, as well as those who worked in the bureaucracy (accountants, scribes, etc.).

In any case, the *kurtaš* were certainly not the only people working the land. Persian peasants are in fact portrayed several times by the Classical authors, unfortunately in references that are quite indirect. Among the reforms attributed to "Cyrus," Xenophon describes the establishment of a corps of 10,000 lancers in the royal guard; according to

Xenophon (Cyr. VII.5.67), Cyrus chose Persians who lived in abject poverty; Xenophon calls them *autourgoi*, that is, farmers working their own small parcels. This is also the word used by Aelian (VH I.31). These peasants are sometimes mentioned by name (Sinetes, Omises, Rhakokes); they worked hard (I.31) in their gardens (*paradeisoi*) and farms (*epauleis*; I.32). They raised animals (cattle, sheep) and cultivated wheat and the vine, fruit (I.31–32) and vegetables (lettuce: I.34). This is obviously the social class Xenophon's Pheraulas comes from. His father was a poor peasant, forced to borrow seed in the difficult gap between two harvests (Cyr. VIII.3.36–38).

The importance of these texts, however, is in providing a concrete picture of a little-known segment of the population, namely, free smallholders, since the entirety of the documentation from Persepolis leads us to suppose that the land was worked entirely by the *kurtas̄*. But what possible relationship to the information found in the tablets can be discovered? We might, for example, contrast the case of Pheraulas's father with the *kurtas̄* who received seed from the administration (PF 123, 463, 484, 508). However, what is the informational value of the rags-to-riches tale of Pheraulas? We know, again from Aelian, that the Persian smallholders were required to give gifts to the Great King when he crossed Persia (VH I.31–32). Is it possible that the recently proposed meaning 'gift' for *nutanuyas̄/nadānu* allows us to understand Aelian?

It has also been proposed that the growers entered into a farming contract with the administration each year. They kept and fed the animals entrusted to them and in return kept part of the increase. But it must be noted that no such system is set forth in the documentation available to us. All we have is two accounts (PF 2010–11) that give lists of persons (12 and 22). Some of these people's names are found in other documents, where they are clearly labeled administrators. One of these was Mannuka, who in 493 was responsible for the flour paid for tanning work. To be sure, the potential for men with the same name counsels caution. But do these data really have to do with free smallholders? According to this theory, the boundary between the produce of farmers or landowners and the produce raised on lands controlled directly by the administration is not clear. Did the agricultural *kurtas̄* simply have to pay part of their produce, keeping a fixed percentage for themselves?

In sum, the uncertainties remain so great because we do not know the answer to a basic question: can all of the assessments that can be identified in the tablets be considered fiscal levies (whether they are called tribute or not, which remains a subsidiary discussion)? Indeed, this question raises another, which is also very important, of the status of lands and persons in the Persian countryside. The observations presented above represent only partial answers, which now must be considered more systematically.

5. Lands and Estates

Partetas̄

Despite the stress placed on agricultural and animal produce, the tablets hardly ever refer explicitly to the soil—apart from a few (uncertain) references to pastureland. Nonetheless, three words deserve special attention: *partetas̄*, *irmatam*, and *ulhi*. There can no longer be any doubt that the *partetas̄* corresponds precisely to what the Greek authors meant by "paradise," which in turn is clearly a loanword from Persian (**paradaida*). The criticisms that had been leveled against this interpretation were based on the belief that the Persian paradises were solely hunting preserves. However, the Classi-

cal sources prove indubitably that paradise use was much more varied. Paradises also included plantations and farmlands, especially produce gardens and orchards. For Xenophon, the paradise was a specific kind of garden (*kēpos*; *Oec.* IV.13). The notion of gardens/fields is what Aelian means by the word (*VH* I.32), referring to small holdings in Persia proper, and it is the meaning of “market gardens” that the Greeks retroject to the Hellenistic period. At any rate, this is the sense of the word in a Greek inscription from Sardis, of Achaemenid origin (*Sardis* VII.1.1), that records the various components of a “gift estate” (*dōrea*).

Favorable locations were chosen for the *partetaš*: , in particular, places with running water—rivers and springs. Several parts of Persia offer these features. Following Nearchus, Strabo (*XV.3.1*) and Arrian (*Ind.* 40.2–5) divided Persia into three major climatic and ecological regions. The Persian Gulf coast was described as “sandy and sterile owing to the heat.” The northern mountainous zone was “wintry and snowy.” In contrast, Arrian emphasized the fertility of the central zone, what Strabo called Coele-Persis, which he placed in the neighborhood of Pasargadae (*XV.3.6*):

The country is grassy with water meadows, many vines and all other fruits except the olive; it is rich with all sorts of gardens (*paradeisoi*), has pure rivers flowing through and lakes, and is good for all sorts of birds that haunt rivers and lakes, and for horses; it provides pasture for the other domestic animals, is well wooded, and has plenty of game. (Arrian, *Ind.* 40.3–4♦)

Quintus Curtius described the Persepolis area as “a spacious plain . . . , a fertile land, and abounding in many villages and cities,” watered by the Araxes, edged with “plane trees also and poplars,” “and the soil was very rich and abounded in fodder” (*V.4.6–7, 20♦*).

This was also true of the region of Fahliyun, within Persia and Susiana. The eye-witnesses (of Alexander’s time and later) have left enthusiastic descriptions: “Rich, watered by numerous streams, and productive of many fruits of all kinds” (Diodorus *XVII.67.3♦*). After describing the road between Susiana and Persia as “steep-sided, sun-scorched, offering no respite,” Diodorus of Sicily notes the sudden change that welcomes the traveler entering the Fahliyun basin:

[The second part of the road] was over high land, blessed with a very healthful climate and full of the fruits appropriate to the season. For there were glens heavily overgrown and shady, cultivated trees of various kinds in paradises, also natural converging glades full of trees of every sort and streams of water, so that travellers lingered with delight in places pleasantly inviting repose. Also there was an abundance of cattle of every kind. . . . In density of population, too, this country far surpassed the other satrapies. (*XIX.21.2–3♦*)

There can be no doubt that such a paradise was the location for an Achaemenid-period pavilion that has been discovered in the Fahliyun region. It was also in paradises that the king and court very often halted during their relocations (e.g., Plutarch, *Art.* 25.1). Of course, the fertility of these paradises also relied on hydraulic installations such as have been uncovered by archaeologists in the paradise near Pasargadae. We even know that Cyrus’s tomb was so equipped: “A grove had been planted round [the paradise] with all sorts of trees and irrigated, and deep grass had grown in the meadow” (Arrian, *Anab.* VI.29.4♦). Achaemenid-period canals and reservoirs have also been discovered in the Persepolis plain.

One Fortification tablet (PFa 33) is particularly illuminating. It is an inventory (referring to seed?) of 6,166 fruit trees (quince, pear, apple, date, mulberry, etc.) that were to

be planted in three paradises close to Persepolis. Two other texts (PF 1946, PT 38) apparently refer to *kurtaš* whose job was “guarding trees” (cf. also PT 49 and 1963: 9). Another tablet (PF 1815) mentions rations to be given to four *kurtaš* whose job had to do with trees in a paradise near Persepolis. The paradises were also potential sources of lumber (cf. esp. Plutarch, *Art.* 25.1–2), which was especially impressive in lands such as Babylonia that had no forests (Strabo XVI.1.5, 11).

Aside from these occurrences (which are the easiest to interpret), the word *partetaš* reappears in a series of 15 tablets (PF 144–58). Some of the paradises named in these tablets seem to be located in the Persepolis area, one of them at Nupistaš (Naqš-i Rustam?). But the tablets deal only with administrative matters, not with estate management. They are actually records of storage of several products: various fruits, dates, figs, and grain—*tarmu* were placed in the care of an administrator for later distribution (as rations) on orders to be received by the distributor (sometimes explicitly named). We may note that on ten occasions the products are called royal (*sunkina*). But this point is difficult to interpret, because the adjective “royal” is not used systematically; it appears to modify less the storage depot than the origin of the products collected—which for that matter represents another problem (chap. 11/10 below). From this elliptical record, it seems likely that the administration of the paradises—which must have had a specific manager, in Persia as in other regions—was included in the general management of produce that circulated between different administrative levels and different districts; in this respect, then, paradise administration functioned as just another branch of government, at least under certain conditions.

Irmatam

The second category of “estate,” the *irmatam*, poses more difficult problems. We are not certain of the Old Persian equivalent. In the Elamite version of the Behistun inscription, the word appears in connection with Vivāna, who was said to “perform the function of satrap in Arachosia” (DB §47). In the great revolts of 522, Vivāna won a battle with the rebels near the fortress of Aršādā in Arachosia, and this fortress is called Vivāna’s *irmatam*. This usage is difficult to interpret, for two reasons. First, there is no equivalent for this phrase in the Old Persian version, which has nothing but ‘fortress’ (*didā*), as in the Akkadian version (*birtu*). It is also hard to determine, from all the evidence, just what the Elamite writer had in mind. Given that in the tablets from Susa from the time before Achaemenid dominion the word *irmatam* referred to a kind of “estate” (in a vague sense) and that the word appears to be borrowed from Old Persian in the first place, there is no reason to think that its meaning would be any different in the Behistun inscription. But if so, why would the Persian version have the word *didā*? And what was the relationship between a fortress and an *irmatam* in a satrapy in 522? It is possible that, as in the Persepolis tablets, the word ‘fortress’ (Elam. *halmarrisš*) refers to both a military headquarters and an established administrative center, something like a county seat that collected the produce of the surrounding region. If the satrap Vivāna held an “estate” there, we can understand why the rebels would have made it the prime objective of their offensive. The text also makes it clear that these estates existed before the reign of Darius, a fact that could not be known for certain from the Susa tablets.

The word appears in 30 Fortification tablets (9 of them unpublished). Each time, it is associated with a person’s name: the *irmatam* of Ištīmanka, of Irṭuppiya, of Dayaka, of

Mišparma, etc. In most cases, the texts record the deposit of merchandise in an *imatam* (PF 2079), or the *imatam* is at the disposal (*kurmin*) of a specific administrator. These products are 'set aside' (*nutika*; e.g., PF 1857) before being distributed in ration form by a distributor, who is also named (PF 331, 1256, 1892). These rations can be distributed to *kurtaš* (1368, 1802) or to animals (331: camels), sometimes on sealed orders of the king (PF 1256). On one occasion, one of these estates is called simply "the one where Iršena, the head of the *kurtaš* (*kurdabattiš*), is the organizer/distributor (*šaramana*)" (PF 1368). The same tablet also shows that the estate in question served as a stopping-place for troops of *kurtaš* who were being moved from one place to another; they received travel rations for one day.

From this perspective, the *imatam* are included within the general administration, just like the *partetaš*. Both served as collection, storage, and distribution centers for local produce. In addition, *imatam* and paradises are sometimes associated. In six tablets (PF 150–55) dated to year 22 (500), the destination of grain deposited in some paradises is given as follows: "To be used in the *imatam* of Šutezza." Two of these tablets can be connected with three others that are included in the series concerning levies on agricultural products of the nearby villages or farms (PF 152/640–41, 153/637). In these tablets Šutezza appears to be in charge of produce that was collected around Mutrizaš (PF 640) or Šaurakkaš (PF 641) and stored in the paradises of Mutrizaš and Kutkuš. At Kutkuš, Šutezza again was in charge of the grain set aside for seed (PF 520–21).

Nevertheless, there is no doubt that the *imatam* were also agricultural estates. Most were located in the central region, near paradises, which implies that they had been carved out of fertile, irrigated land. We are led to suppose that they were granted by the king to administrators. They were thus perquisites, including the one Vivāna had been granted in Arachosia because he was satrap. Given all these factors, the gift can hardly be considered entirely free. The concessionaires were not free of obligation to the administration; they were mere cogs in the machinery. In some inventories, the *imatam* are located in a district (*batin*) and near villages (*humanuš*). The structure of the text on one tablet (PF 1857) seems to imply that they were also accounted as financial units by the administration. This tablet also indicates that the concessionaires of "estates" were required to turn over part of their produce (grain in this instance) to the administration's warehouse. Another tablet (PF 2070) concerning the levying of *baziš* confirms that these estates did not enjoy any sort of financial immunity: four "taxpayers" are actually referred to as "being at the *imatam* of Miturna(?)," who himself carried out official tasks; this may be why he had this estate.

Ulhi

The third word is *ulhi*. In the royal inscriptions, *ulhi* corresponds to Old Persian *viθ* and Akkadian *bitu*, two synonyms that can be translated 'house', which is less a building than the ensemble of people who live and work on an "estate," which includes lands and various kinds of farms and which is headed by the master of the house. This is exactly the sense of the word in §16 of the Behistun inscription: where the Old Persian has *viθ*, the Elamite has *ulhi*. In his prayers to Ahura-Mazda (cf. *DNa* §6, *DPe*), Darius beseeches the god to protect him and the people of Persia (*dahyu*) and his house (*viθ*). And certain decorative elements in the palace (window frames, door hinges) bear the inscription "Made in the house (*viθ*) of the king" (*DPc*, *DPi*, *A1I*). The word corresponds

exactly to Greek *oikos*, which is what the Greek texts frequently call the Persian royal house (e.g., ML 12). It also appears in this meaning in several Persepolis tablets. In 506, Parnaka, under orders from King Darius, sent the following order to Harrena, head of the flock department: "Give Irtašduna, the princess, 100 sheep [to be taken] from my house" (*ulhi*; Fort. 6764). In another tablet (PF 1987³⁰⁻³²), sheep are transferred to the royal house (*ulhi sunkina*) and entrusted to the care of a shepherd.

Other people operated in an estate referred to as an *ulhi*. This was the case for Irtašduna, one of Darius's wives, known to Herodotus as Artystone, who had two of this kind of estate, at Mirandu and Kuknaka (PF 1835–37), and also for Arsames, a son of Darius (unpublished tablet), and also for a woman called Irdabama, who held an *ulhi* at Šullake (PFa 27). It is likely that Irtašduna also held interests near the village of Matannan, where she sent a letter requesting a supply of grain (PF 1857). Twice grain was apparently set aside at her request (PF 166 and 168). In the second example, the organizer (*šaramana*) is named Šalamana; this was probably the same person who transmitted Artystone's orders for the delivery of produce "taken from her *ulhi*" on three separate occasions (PF 1836–38). Two other individuals had this kind of estate: Rammanuya (PF 1855) and perhaps Naktanna(?; PF 2075). Unfortunately, we know nothing of their circumstances. In every case, these estates appear in letters in which the master or mistress of the *ulhi* orders the delivery of a certain amount of produce to a particular person, specifying that they were to take the grain or wine "from my *ulhi*." One letter from Irdabama is addressed to accountants (PFa 27), and one from Artystone expects rations for her accountant Kamšabana (PF 1837). Physically, the agricultural estates connected to an *ulhi* cannot have been different from an *irmatam* or a paradise. The terminological distinction may not be random, however, since members of the royal family never receive an *irmatam* but always an *ulhi*. But this observation—which may be overturned by the publication of additional tablets—does not help explain the actual difference in status. In the village of Matannan, it even appears as though some of the produce was paid to the administration on Artystone's orders (PF 1857).

The house of the princesses included much more than farms. They obviously had a personal retinue and a sizable staff. Evidence for this is the large quantities of foodstuffs placed at their disposal for travel (PF 730–39, 2019, 2035). The same was true for other royal princesses (PFa 5), who doubtless also headed houses. Arsames is named in these contexts, along with Artystone (PF 733–34, 2035). He also had horses (PFa 24, 29¹⁰). Furthermore, several tablets list the payment of rations to *kurtasš*, who are called *kurtasš* of Artystone or Irdabama (PF 1236, 1454; 849, 1002, 1028–29, 1041–43, 1098, 1109, 1198, 1221, 1232). These documents are problematic, because they do not make clear the relationship between the princesses and these workers, who do not seem to be distinguished from other identical groups. They work in a specific place (Shiraz, for example); they perform the same labor (for example, the women-*pašap* of Artystone: PF 1236). It is possible that these *kurtasš* were generally attached to the administration but that their services may have been required by the beneficiaries of the temporary assignment. On the other hand, members of the royal family surely also had subordinates who were permanently assigned to work in their house, such as the person "attached to the house (*viθ*) of Hystaspes," father of Darius (PF 1596), who may be compared with the people attached to the royal *viθ*, among whom were included personnel holding important positions in the palace economy (PF 1946⁷³⁻⁷⁷).

6. The Persepolis Tablets and the Imperial Administration: Sources and Problems

After reconstructing the organization of labor and production in Fārs, especially in the time of Darius, a basic problem remains. Should the picture derived from the tablets be confined to Persia proper, or can it be extended to all (or to some parts) of the Empire, albeit taking into account local circumstances? Or, in other words, does the Persepolis documentation specifically reflect, however mechanically, organizational peculiarities of Persia proper only? Let us stress from the start that the question has a decisive importance: from the answer two contradictory pictures of the Achaemenid Empire follow. One picture reveals a very lax organization of countries that continued to carry on according to their traditional ways, without any impact of Persian dominion detectable. The other—the so-called “hard” view—turns the Achaemenid Empire into an imperial construct in the fullest sense—that is, a State within which the conquerors established and unified rules of administrative organization and economic exploitation that, without a head-on assault on local traditions, nevertheless infiltrated them from within and modified them profoundly, at least in several key ways that permitted the dominant socioethnic class to enjoy hegemony in alliance with the local aristocracies.

Let us begin by dismissing a fallacious argument based on the narrowness of the chronological and spatial extent of the tablets (chap. 11/1 above). The dating of the tablets (between 509 and 458) does not in the slightest imply that the administrative organization known in Darius's time suddenly vanished in the seventh year of Artaxerxes I, nor, of course, that it was not in place before 509. For reasons already given, it is clear that we have only a tiny sample of a mass of documentation that must have been enormous. As for the geographic range of the tablets, here too we must beware of the vagaries of preservation. First of all, it cannot be denied that there were archival deposits in every satrapal territory. Herodotus inserts this detail, as an aside, regarding the secretary of Oroetes: “an officer who forms part of every governor's establishment (*grammatistai basileioi*)” (III.128♦). Xenophon also alludes to this institution when he mentions the presence of Megaphernes, a “royal scribe,” in Cyrus the Younger's service (*phoinikistēs basileios*; *Anab.* I.2.20). In Babylonian, biblical, and Egyptian documents, we also find exalted persons in the satrapal administration bearing the titles (sometimes multiple) *bēl lēmi* and *sipīru*, that is, ‘chancellor’ and ‘scribe’. It is thus very clear that all the satrapal chancelleries were organized on the same model and that they were responsible for dispatching letters and orders and receiving and preserving letters from the royal chancellery.

It is true that no satrapal archive in the strict sense has been found intact and complete. This gap is due first to the chances of discovery but also and especially to the perishability of the commonly used materials (papyrus, parchment, wooden tablets coated with wax). An episode from the *Life of Eumenes* (2.6–7) very concretely attests to the fragility of these archives: after the destruction of Alexander's tent by fire, “the king wrote to all the satraps and *strategoī* to send copies of the destroyed documents, which were all collected, following his orders, by Eumenes.” And at Dascylium, satrapy of Hellenistic Phrygia, a group of bullas bearing cuneiform and Aramaic inscriptions and sealings has been found. Some of them are written in the name of Xerxes. The impressions left by papyrus and thread attest to the existence of letters and documents written on parchment or papyrus deposited in the satrapal archives; only the clay envelopes (the bullas) have survived to this day.

The spatial extent of the tablets is considerably widened by Category Q (travel rations), which covers all the imperial territories. The very operation of the system implies that the archives associated with warehouses that supplied the road network were numerous throughout every satrapy. But it is likely that many items were recorded on papyrus or parchment. It was the same for the travel voucher given by Aršāma to his steward Neḥtiḥōr when he sent him to Egypt (DAE 67 [AD 6])—and the relationship of this text with the tablets of Category Q has long been recognized. Other documents, such as the Aramaic ostraca of Arad, confirm—if there were any need—that the organization of travel on the royal roads relied on a unified imperial system. Elsewhere, though exceptional, several discoveries are noteworthy, in particular an Elamite tablet from Susa, another from Kandahār, others in Armenia(?). Paradoxically, the random character of these finds testifies to the fact that they are representative (cf. chap. 16/18).

It is thus possible that the specificity of the Persepolis documentation does not imply that the bureaucratic organization of production was limited to Persia or to the Persepolis–Susa axis. Obviously, this remains to be proved, on the basis of better-assembled regional corpora. It would in fact be bad methodology to extend mechanically any analysis drawn from the tablets to the entire Empire. The reason is not simply that Persia and the Persians constituted a country-people (*dahyu*) with an out-of-the-ordinary political and ideological status. It is also because, on some points, the interpretations of the tablets are burdened with a degree of uncertainty. Under these conditions, to be grounded, any extension of the results of analyzing the tablets must come from comparison with other documents that are themselves unequivocal.

7. The Management of Property and the Royal Warehouses in Egypt

Egypt's very arid climate means that only its documentary record is comparable to that of Persepolis. In addition to a quantity of letters on papyrus or skin from the archives of the satrap Aršāma, we have several official letters attesting to the minutiae of the satrapal administration, especially concerning the receipt and disbursement of products that require the existence of warehouses. We will illustrate this topic through five documents. Some of them are late (reign of Darius II), but all of them allow us to imagine that the organization they depict goes back at least to the reign of Darius I.

The Resupplying of the Garrison of Syene–Elephantine

The first document is a demotic papyrus from the last year of Darius I (486; P. Loeb 1). It states that the Egyptian Khnumemash, son of Horwenmefer, had been instructed along with the Persian Artaban to seek out commodities, especially wheat, in the mountainous region (*jebel*). The grain was to be stored, probably at Syene, in the house of the man who had given the order, another Egyptian, Osoreris. The letter of claim/complaint is addressed to Parnu, “chargé of the southern district,” who was Osoreris's immediate superior. We can imagine that Khnumemash was an Egyptian boatman and that he worked for the administrators responsible for feeding the soldiers of Syene–Elephantine, under the direction of Parnu.

The resupplying of the garrison is also the topic of an Aramaic document (DAE 54 [AP 2]) dated to year 2 of Xerxes (484). Two people with Jewish names, Hōsea and Ahīʿab, received commodities (barley and lentils) directly from an Egyptian named Espemet, “servant(?)” of the commander Hananī—commodities that he was ordered to transport by boat to Elephantine. The barley and lentils were intended as rations for the

soldier-colonists: 22 soldiers belonging to two different military units (centuries). Hōsea and Ahīʿab were instructed in Espemet's presence to deliver the commodities "before the officials of the house of the king and before the scribes of the warehouse"; it was the responsibility of the latter to organize the division among the 22 garriseers envisioned by the document. The document is authenticated by numerous named witnesses and also specifies the amount of individual rations and the total of commodities received: 32.38 hl, of which 6.16 hl was lentils. The warehouse scribes were to repay the cost to Espemet. In the corresponding case, Hōsea and Ahīʿab undertook to pay Espemet 100 karš of refined silver. As a deposit, they put up as collateral the salary they received from the house of the king as well as their houses and property, which, if there were a default, Espemet would have the right to seize. We thus see that in Egypt the various ranks of the hierarchy were personally responsible for the goods in their charge: in case of loss or theft, they had to repay the value out of their own pocket.

Another document (DAE 55 [AP 24♦]) permits a better understanding of the procedure, although it comes from a later period (May 419). It concerns the accounts of the garrison of Syene–Elephantine. The scribes and accountants summarized the total of rations distributed to the soldiers of Syene and Elephantine in one year. The barley in question came from various locations, from the province of Thebes and the southern district (of which Elephantine was the capital). It had been brought to Syene through the efforts of several people with Egyptian names, probably boatmen whose status was analogous to that of Espemet or Peteisis, another boatman known from an Egyptian seal. Part of the cargo was deposited in the granary; the rest was distributed to soldiers of the garrison as food rations (*ptp*). As far as we can reconstruct, the traffic in goods was thus handled at Syene in a manner clearly similar to the process reflected in the Persepolis tablets. The document under consideration is very like general accounts prepared at Persepolis. A fourth document, moreover, indicates that the local administrators—the scribes—were required to send "each item month by month" to Memphis (DAE 60 [AP 17♦]). The local administrators were reimbursed by the central office in Memphis on the basis of this document. Inspectors (*"azdakara*) were responsible for overseeing the regular ration distribution procedure on the spot.

The Repair of an Administration Boat

The fifth document (DAE 61 [AP 26♦]) is an especially rich illustration of the bureaucratic nature of the satrapal administration. Dated 411, it concerns the repair of a boat. The boat was operated by two Egyptians, Psamsineith and another boatman whose name is not preserved, both of whom have the title "boatmen of the fortifications"—the latter word referring to Syene and Elephantine. The boatmen are not the boat-owners: they have "charge of it" in the same way that the soldier-colonists have "charge" of land. The boat thus belonged to the administration. The Egyptian boatmen use it for official business, such as transporting foodstuffs to Syene, a service for which they receive payment.

We also note that at this time Psamsineith and his partner's boat was in need of repair: its deckwork needed to be entirely replaced. The work could only take place in an administration dockyard, at Elephantine, and to this end the managers had to commit to expenses that in the last analysis could only be authorized by the satrap Aršāma. This was the reason the letter was sent by Aršāma to the Egyptian Wahpre'mahi, who seems to have been responsible for the management of materials at the Elephantine navy yard. But the final decision was preceded by a voluminous exchange of letters and orders

between Syene and Memphis. First of all, Psamsineith and his partner had sought out their immediate superior, the Persian Mithradāta, who had the (Persian) title **nav-pati*, or head sailor; he had authority over the numerous boatmen in his district. They had informed Mithradāta of the state of disrepair of their craft. After an initial inspection of the boat, which had run aground “in front of the fortress,” a report had been sent to Aršāma by Mithradāta’s boss. But, before authorizing the repair, the satrap required an inspection to be made and a very detailed estimate drawn up. These operations had to be carried out jointly by the treasury accountants (**ganza*), the “foremen” (**framanakara*; Šamašillek and his colleagues), and the head carpenter in charge of the district, an Egyptian called Šamaw, son of Konūfi.

After the inspection of the boat—carried out in the presence of Mithradāta and the two boatmen—a very precise estimate was communicated to the office in Memphis. Thereupon, the sarrapal office sent an order to Wahpre³mahi authorizing him to furnish the materials to the head carpenter Šamaw: the number and quality of wooden boards needed for the repair of different parts of the boat are listed, as well as other supplies (sails, bronze plates, etc.)—even the number of nails: 425 bronze nails for the gunwale, 200 for attaching metal elements. Additionally, they were required to provide arsenic and sulfur, whose weight would be calculated “according to the standard weight of Persia.” It was also specified that, in exchange for the new wood, “they shall bring to the treasury the used wood and broken (boards).” This detail bespeaks the rarity of wood in Egypt. The text also indicates that among the boards provided to the carpenter were “used pine boards.” But it also shows that the administration would not allow the waste of any items that were its property; for example, they did not want the boatmen (or the shipyard workers) to resell the used boards for their own profit! There is no doubt that, upon completion of the repairs, the administration in Memphis required from Wahpre³mahi an equally detailed written proof of the use of the materials. This implies yet another inspection of the boat by the head carpenter and the treasury accountants; it was up to them to determine whether the administration warehouses should receive back any unused nails! And this entire bureaucratic apparatus was deployed for a total expense of not more than one talent ten minas!

Royal Dockyards and Workshops

Other dockyards are known in Egypt, particularly the dockyard in Memphis, which is attested in an Aramaic document that unfortunately is poorly preserved. It is called “house of boats.” The text itself is a sort of journal in which the movements of the personnel are minutely recorded. The personnel are multi-ethnic and, as at the Elephantine colony, the dockyard workers are grouped in “thousands” (*dgalīm*), which were perhaps in turn divided into centuries (as at Persepolis). One of these thousands reported to an Iranian, Bagapāta. As it stands, the document supplies no direct information on the status of the workers garrisoned in the Memphis dockyard. There is nothing that permits us to equate them with the *kurtas* of Persepolis, though this theory is attractive. Nor do we know anything of their actual relationship with the military *dgalīm* attested at Memphis in more recently published papyri.

The existence of royal workshops in Egypt is strongly implied by the discovery, at Susa in particular, of many aragonite vases with hieroglyphic inscriptions with the names of Darius, Xerxes, and Artaxerxes I, in a simple form “Xerxes Great King” or a more elaborate form, such as “King of Upper and Lower Egypt, Lord of the Two Lands,

Darius, may he live forever." The vases of Xerxes and Artaxerxes have a quadrilingual text (Persian, Elamite, Babylonian, and Egyptian). Several of these vases are dated by regnal year. Two of them indicate the contents in Egyptian measures. It is virtually certain that these vases were made in Egyptian workshops and sent to the central court. Perhaps the manufacturing process was organized in Egypt after the pattern of the Persepolis workshops that specialized in stone vessels (chap. 11/3 above). Royal stone tableware has also been found at Persepolis. The inscribed objects bear the name of Xerxes exclusively, in four languages. Their shape and the engraving of the inscriptions are very similar to earlier Egyptian vases. But it is difficult to say whether they were made in Egypt, rather than in Persepolis by Egyptian craftsmen.

Manufacture of weapons is known in Memphis already during pharaonic times. Vases inscribed with the names of Psammetichus and Amasis have been found at Persepolis, part of the booty seized by Cambyses. They are very like the vases dated to the time of Darius and his successors. Shipyards are also very well attested in pharaonic Egypt. The boatyards were controlled by the "master of the shipping," whose duties and powers were assumed by the satrap of Egypt. Nonetheless, the obvious continuity must not cause us to lose sight of the innovations introduced by the Persians. The abundance of Persian-origin administrative terminology in the Aramaic texts provides specific evidence of this; the meaning of these terms can often be recovered by comparison with the Persepolis tablet lexicon. The treasury (**ganza*) named in the papyri seems to operate in a fashion identical to that of the treasuries found in Persia. It can be referred to with the terms "warehouse," "king's warehouse," or "king's house." In each case, it includes both a treasury proper and warehouses, since the military received salaries in silver (*prs*) as well as rations in kind (*ptp*). The treasury is where the reserves are deposited, "before the authorities of Government House and before the clerks of the treasury" (DAE 54 [AP 2⇨]). This provides us with an illustration of a procedure well known in Persepolis, where the produce is "at the disposal" (*kurmin*) of an official, who then provides it to the official in charge of distribution (*šaramana*).

Titles well attested at Persepolis are also found. At Elephantine, the disbursement from the warehouse of the materials needed for repairing the boat is authorized by officials who bear the Persian title **hamarakara*, a title also found in the texts from Persepolis and in Akkadian documents. These officials are simultaneously archivists and accountants who according to the Treasury tablets are in charge of groups of *kurtaš*. Among the officials responsible for drawing up the estimate (also a Persian word) were Šamašillek and his colleagues, who bear the title *framanakara* 'foremen'—a term that also appears in the Persepolis materials. Analysis of the documents shows that these borrowings are not only linguistic; they relate to an identical organization for managing produce and its distribution among the warehouses and treasuries.

8. Management of Surpluses

Back to Pseudo-Aristotle

At this point, a parallel with another source is inescapable: the *Oeconomica* of Pseudo-Aristotle. When the Treasury tablets were published by G. G. Cameron in 1948, one of the first reviewers (F. Altheim)—soon followed by Cameron himself—pointed out the similarities between Pseudo-Aristotle's analysis and the practices of the administration in Persepolis. The proposed comparisons deal with the payment of rations in

silver to the *kurtaš*, interpreted in light of an expression in the *Oeconomica*. We will soon come back to this passage. Let us simply note that it is included within a broader discussion of the royal economy, which embraced four sectors: “coinage, exports, imports, and expenditure” (II.1.3♦). At this point, the author refers very tersely to the management of surpluses in kind generated by the assessments imposed by the administration. The Persepolis tablets, especially the Fortification tablets, provide both a striking confirmation and a precise commentary on Pseudo-Aristotle’s analysis, because these four categories relate to the basic, central operations that may be reconstructed from them: assessments/warehousing/archiving/distribution.

For the administration responsible, the first duty was to oversee the preservation and recording of products collected. To stay within the same geographical and chronological framework, we may cite a Greek parallel dating to the very beginning of the Hellenistic period (320), a text that echoes Pseudo-Aristotle as much as the Persepolis tablets. The Diadoche Eumenes of Cardia—who at the time was under attack by Antipater, who considered himself the supreme representative of the imperial order—was reinforcing his cavalry from the royal stud farms of the Ida, in Troas:

He took as many [horses] as he had occasion for, and sent an account of his doing so to the overseers, at which Antipater is said to have laughed, calling it truly laudable in Eumenes thus to hold himself prepared for giving in to them (or would it be taking from them?) strict account of all matters of administration (*ta basilika*). (Plutarch, *Eum.* 8.5♦)

Antipater’s reaction might be understandable; he was surprised to learn that Eumenes, even during such a chaotic period, showed himself to be so legalistic and hopeful of his political survival. That is, Eumenes, careful to display his loyalty, took care to apply the accounting rules that the Macedonians had carried over from the Achaemenid administration. At the same time, the episode strongly suggests that the political disturbances had done nothing to modify bureaucratic routines; the bureaucrats knew well that at any moment they might be asked for accounts of their management—that is, a ledger of receipts and outflow.

Surplus in Kind and Exchanges

The author of the *Oeconomica* not only discussed the stocking of produce of the *tagē* in the royal warehouses (*paratheseis*), such as those located at stages along the royal roads (II.2.34a: *thēsauroi*) or the strategic reserves deposited by the satraps in their territories (e.g., Xenophon, *Anab.* III.4.31), but also considered their marketing. The phrase “consider at what moment and in what way it will be advantageous to sell them” refers to one of the missions of the royal economy, which operated equally on the *exagōgima* and the *eisagōgima* (II.1.2). These two words designate not what we call exports and imports, but rather the shipment of produce out from and receipt into the royal warehouses. Perhaps the author was thinking of the needs of the State apparatus (army units on the move, official travel on the royal roads, royal table, transfers of produce from one satrapy to another, etc.), maintenance of which required permanent inventories. But his analysis goes further: the verb used, *diatithestai*, comes from the vocabulary of the market. What the author is referring to, then, is a method that made it possible for the king to make money by selling off surplus from his granaries at the right moment (II.1.3).

There is no hint of a theoretical approach. It is clear that, aside from massive requisitions like those of the Great Kings for their expeditions, or aside from particularly bad

years, the inventories of wheat (or other products) were subject to precise management: what was to be done with the surplus? This is exactly the question answered by the author: the administration profited from circumstances favorable to releasing inventories to the market. The author clearly found this problem very interesting, as is shown by one of the financial strategies he attributed to Antimenes of Rhodes, in Alexander's time: "Antimenes ordered the satraps to keep the storehouses along the royal roads filled according to the custom of the country; but whenever an army or any other body of men unaccompanied by the king passed along, he used to send one of his own men and sell the contents of the storehouses" (II.38♦). Though Antimenes' behavior appears rather reprehensible from the perspective of administrative regulations, it at least recalls the principle set forth by Pseudo-Aristotle—namely, the marketing of wheat from the royal granaries.

A concrete illustration of the procedure is found in another document from western Asia Minor in the last quarter of the fourth century. In a reply to the ambassadors from the town of Lebedos, Antigonus the One-Eyed answered that he was not favorably disposed toward the maintenance of wheat reserves by the towns themselves: this system would prove too costly to them, he wrote. And he recalled his policy in the following words:

Until now, we have not been willing to grant to any town the right of importing wheat or establishing wheat reserves. . . . Again in the present case, our initial thought was not to authorize this operation, inasmuch as the tribute land (*khōra phorologoumenē*) is nearby, and thus it is easy, we believe, to seek out there whatever may be desired. (RC 3⁸⁰⁻⁸⁵)

In other words, the king profited from the existence of a nearby market (Greek cities) by selling surplus wheat derived from tribute (to use the word in a general sense). At this date, he even had sufficient political means to impose what appears to have been a sort of monopoly; since the towns did not have the right to buy overseas, they were required to buy from the administrators of the royal granaries. We have one other attestation from the beginning of the Hellenistic period, in a decree in honor of Thersippos: one of the good deeds for which he was recognized by the city was the provision of wheat to the city during a famine (*sitodeia*): "He obtained from the satrap the right to import wheat (*eisagōga[n sito]*)" (OGIS 4). This wheat clearly came from the satrapal administration's reserves, and the previous example strongly suggests that Thersippos negotiated the purchase with the satrap. Other inscriptions published more recently confirm the frequency of such sales in the Seleucid period.

It is clear that these practices were inherited from the Achaemenid period. This assertion of continuity is not simply hypothetical. First of all, the existence of satrapal inventories is explicit in the instructions issued by Darius regarding Jerusalem (Ezra 6:9; cf. Josephus, *Ant.* XI.16). We have decisive evidence for the practice itself (that has been entirely overlooked). It comes from an Athenian decree of disputed date (probably toward the middle of the fourth century) that honors the satrap Orontes, who at the time held a post in Asia Minor (presumably in Mysia). Orontes was awarded Athenian citizenship because he had responded favorably to a request from the town. The Athenian armies at the time were fighting in the regions near the Straits; because they were in extreme financial difficulty, the *stratēgoi* found themselves unable to pay the *misthos* (part of which was to be paid in kind) to their soldiers. Athens then turned, quite naturally we might add, to the Persian satrap, because every Greek knew that he had vast reserves of

wheat (like any other satrap). Athenian ambassadors then came to present this request to Orontes. The decree clearly shows that Orontes did not donate the wheat but sold it—because the decree states which funds the necessary payment was to be taken from, and it gives instructions to the treasurers regarding the repayment of the funds to the satrap (IG II² 207a). It thus seems clear that Antigonos and the Seleucid kings were merely following the example of the satraps of Asia Minor: they would regularly offer for sale the surplus of the royal granaries on the Aegean market—with, no doubt, the prior assent of the central authority and on condition that the price be high.

The Fish of Lake Moeris

Several passages in Herodotus provide further indication of the conversion into silver of levies in kind. He notes—as we have already seen—that the profit on fish from Lake Moeris paid a talent a day to the royal treasury (*to basilikon*; III.91). To put it another way, every day the “royal fish” were sold on the nearby market, in Memphis or elsewhere. This is of course a special case, since it was difficult to preserve fish, except as salted fish, which the Egyptians were very fond of (II.77). But in the long term, it was a general problem for the administration: how can we turn a profit on the yield of income in kind?

The Athos Canal Workers

We might ask whether war was an excellent opportunity for selling one’s inventory. Perhaps part of the answer may be found in Herodotus’s description of the immense preparations made by Darius and Xerxes. On hearing the news from Marathon, Darius ordered the mustering of troops as well as the gathering of “warships, transports, horses, and foodstuffs” (VII.1♦). Several years later, Xerxes reprised his father’s work:

Provision dumps were being formed for the troops, lest either men or animals should go hungry on the march to Greece. For these dumps the most convenient sites were chosen after a careful survey, the provisions being brought from many different parts of Asia in merchantmen or transport vessels. (VII.25♦)

It is unfortunate that Herodotus does not provide further details. But we may suppose that the wheat came primarily from the royal granaries, and that the king had authorized stewards at the granaries to make ‘disbursements’ (*exagōgima*).

We learn that the food supplies for the Immortals, “separate from that of the rest of the army, [were] brought along for them on camels and mules” (VII.83♦). It is particularly unfortunate that we know nothing of the distribution of supplies to the soldiers. Did they receive rations free, or did they have to pay for them? This question may be surprising, but it is legitimate. From numerous examples, we know that ancient armies—including the Achaemenid armies—did not have, properly speaking, a quartermaster corps. Most often, the soldiers lived off the land, either by pillage or by purchase from the locals. This is how Cyrus the Younger’s mercenaries survived; the only preparation he undertook was to plan for flour and wine wagons in case the Greeks were unable to find supplies on the spot (*Anab.* I.10.18). Cyrus’s actual army was accompanied by merchants who presided over the “Lydian market”: at a time of scarcity, the Greek mercenaries came to resupply themselves, but they were discouraged from buying by the prices asked (*Anab.* I.5.6). We also know of Phoenician merchants in Alexander’s army (*Arrian* VI.22.4).

One of the most interesting examples involves satrapal troops in Cyprus in 386–385:

Since Evagoras had such advantages, he entered the war with confidence. First, since he had not a few boats of the sort used for piracy, he lay in wait for the supplies coming to the enemy, sank some of their ships at sea, drove off others, and captured yet others. Consequently, the merchants (*emporoi*) did not dare to convey food to Cyprus; and since large armaments had been gathered on the island, the army of the Persians soon suffered from lack of food and the want led to revolt, the mercenaries of the Persians attacking their officers, slaying some of them, and filling the camp with tumult and revolt. It was with difficulty that the generals of the Persians and the leader of the naval armament, known as Glōs, put an end to the mutiny. Sailing off with their entire fleet, they transported a large quantity of grain from Cilicia and provided a great abundance of food. (Diodorus XV.3.1–3♦)

Indeed, at this time, as in the time of Darius, the Cilician coast constituted a supply base for the Persian armies; it was from Cilicia that the Persian generals drew on royal wheat reserves to bring supplies to Cyprus. When the sea was free, it fell to the *emporoi* to ensure the supplies. We may imagine that in this era merchants went to buy wheat in the royal granaries and then resold it to the soldiers at, no doubt, a considerable profit. In other words, according to this theory, part of soldiers' pay returned to the royal treasury via the royal granaries, minus the traders' cut. Of course, Darius's and Xerxes' soldiers were not mercenaries. But this does not mean that they had less money (in the form of weighed silver). We have already seen that raising royal soldiers in Babylonia did not cost the royal treasury anything, since they furnished their own equipment and the equipment for their staff, and they were required to bring foodstuffs for several days (chap. 10/4). It would not be surprising if troop movements created their own market, permitting the administration to peddle its surplus to its own soldiers.

This is in fact how the system operated that was set up to ensure supplies for the labor force working on the Athos canal, a labor force consisting of contingents of subject peoples and squads requisitioned in the Greek towns of the region:

In a meadow near by the workmen had their meeting-place (*agora*) and market (*prētērion*), and grain ready ground was brought over in great quantity from Asia. (VII.23♦)

It thus seems certain that the workers purchased their rations. Perhaps they received a salary (in whatever form: silver or tokens), which they hastened to spend in the military warehouses!

Return to Persepolis

It is not impossible that Herodotus's text describes a procedure similar to the process seen in action in the Treasury tablets. Beginning in 493, payments were made to the *kurtas* in silver, at least for part of their salary. The *kurtas* apparently received silver and foodstuffs (beer, grain, wine). Some obscurity remains concerning the practical operation. What is certain, however, is that the mode of payment implies the establishment of fixed prices for commodities at the rate of 3 siculi for 1 sheep and 1 sculus for 1 *marriš* (9.7 liters) of wine. This method of payment is often compared to one of the principles of the royal economy, which is reported in these words by Pseudo-Aristotle: "In regard to expenditure, what expenses ought to be curtailed and when, and whether one should pay what is expended in coin (*nomisma*) or in commodities which have an equivalent value" (*anti nomismatos ōnia*; 2.1.3♦)—with the slight but essential difference that the Persians certainly did not use coined silver but weighed silver. Taking this principle together with another rule ("The expenditure must not exceed the income": 1.6.7♦), it is clear that the primary goal of the royal economy was to increase the central authority's revenues.

Given these factors, we may suppose that the silver allocated to the administration workers would buy foodstuffs that would eke out the rations in kind that they received normally. But from whom would they buy? It is not impossible that a private market existed in Persia, since several Babylonian texts refer to merchants in Persia. Also, it is likely that, for example, the court was not fed exclusively by levies in kind, since Dinon (apud Athenaeus 14.652c) alludes to royal buyers (*hoi agorastai*) who came to the market to buy (*ōneisthai*) figs. However, if it existed at Persepolis, this market was not “free” in the usual sense, since the prices were fixed by the administration. Other documents attest to transactions carried out by administrators. Thus, in 503, the head of the warehouse of Udarakka set aside grain and in return received “one top-quality mule and one top-quality cow” (PF 1978). The trade was probably with another warehouse (even perhaps within the Udarakka fortress), not with private merchants. Every case involves exchange of merchandise—never silver. Otherwise, the minuteness of some silver allocations ($\frac{1}{18}$ siculus) makes it unlikely that the administration actually weighed and calculated such small payments. It seems more likely that these payments were strictly “paper” transactions; that is, the *kurtas̄* had credit that they could spend in the administration warehouses. If so, it was a win-win situation for the administration, since it could fix the prices and require the *kurtas̄* to shop there. Living conditions for the *kurtas̄* became more and more difficult as prices rose, as can actually be seen at Persepolis between December 467 and August 466. The texts display extraordinary variation in the price of grain. The price rose to five times normal and then grew still more; it did not return to normal until August 466. We know nothing of the circumstances. All we can say is that the quality of life of the *kurtas̄* eroded drastically because of the administration monopoly. Overall, this example seems to confirm that there was no free market that could (possibly) have lowered prices by massive imports from nearby regions (such as Babylonia).

Compared with the Herodotus text we started with, the Persepolis documents throw a stark, empirical light on the methods involved in managing the surplus goods stocked in the royal granaries. Were these methods applied systematically in every satrapy? Meanwhile, an Aramaic document from Egypt poses a real problem (DAE 54 [AP 2⇨]). Recall that two Egyptian boatmen received barley and lentils from Espemet, servant(?) of the commander Hanani, to transport to the Elephantine warehouse. In fact, the document explicitly provides that the clerks of the Elephantine warehouse were to “reimburse the price” to Espemet, in the amount of 100 *karš*. It shows that a warehouse (Syene) could “sell” merchandise to another warehouse (Elephantine) following a procedure known from documents from Persepolis. Were these goods purchased at Syene on the Egyptian market? It is possible that this is the case, because the provision of produce to the garrisons from tribute paid in kind (Herodotus III.91) would probably not suffice to ensure regular resupply.

9. Lands and Peasants

Kurtas̄, garda, gardu

Comparison of texts from other sources can also deepen our analysis of another series of Persepolis tablets. The word *kurtas̄*, in the form *garda/gardu*, appears in Aramaic documents from Egypt and in Babylonian tablets. Both sources are often used to clarify the meaning of the word *kurtas̄* in the Persepolis tablets. The word *garda* is used in three

Aramaic letters dated 420–410. One was sent by Aršāma to Neḥtiḥōr, manager of the satrap's estates in Egypt (DAE 68 [AD 7]). Aršāma complains about Neḥtiḥōr's behavior, which he compares unfavorably with that of his previous steward, Psammešek, who despite difficulties had "carefully protected our *garda* and property"; he had even sought elsewhere for *garda* to replace those who had died or fled. Likewise for other stewards in Lower Egypt. Hence Aršāma's order: "Seek diligently elsewhere for *garda*—all kinds of artisans; bring them into my courtyard, mark them with my sign, and appropriate them for my estate (*bēt*), just as the former superintendents used to do" [Whitehead]. The second letter was sent by another Persian noble, Varfiš, who also held lands in Egypt. It is also addressed to Neḥtiḥōr, who, defying Aršāma's order, had not given a group of Cilicians to Masapāta, Varfiš's steward. Masapāta had complained thus: "He has assaulted my lady's *garda* and taken goods from them." Hence Varfiš's anger, which is vented in the following words to Neḥtiḥōr: "Now then, you have no business with my *garda*! Give back what you forcibly took from the *garda* . . ." (DAE 73 [AD 12; Whitehead]).

The third letter was sent by the satrap of Egypt, Aršāma, to his steward Neḥtiḥōr and his accountants in Egypt (DAE 70 [AD 9]):

From Aršāma to Neḥtiḥōr, Kenzasirma and his colleagues [accountants]. Now then, I have a servant, a sculptor (*patikaru-kara*) named Hinzanāy, whom Bagasarū brought to Susa. Give him and his staff (*bēt*) the same rations as my other *garda*-personnel [polishers?] so that he will make reliefs of a mounted soldier . . . , and make a relief of a horse with its chariot, just as he formerly made for me, among other reliefs. Let them be dispatched and brought to me immediately! Artōhī knows about this order. Scribe: Rašta. [Whitehead / transliteration of names, Grelot]

Aršāma's letter is constructed on the same pattern that the princesses Itašduna and Irdabama used when drafting letters to the accountants of their house (cf. PFa 27). The sculptor Hinzanāy, 'servant' (*lym*) of Aršāma, and the women of his house (*bēt*) were to receive rations in kind (*ptp*) from Aršāma's steward, "the same as my other *garda*." The sculptor in question—certainly a Mesopotamian—was famous enough to have been summoned to Susa by Aršāma before being dispatched to Egypt. We also see that he was an itinerant artist who took his family with him when he moved. He had laborers under him, specialists in stonework, like the "foremen" of Persepolis (cf. PT 75). His status is not clearly indicated. It is undoubtedly dangerous to make him into a prototype of a free wage-earner. Aršāma calls him a slave-servant (*lym*); the vocabulary is vague (cf. DAE 69 [AD 8]), to be sure, but we might compare Hinzanāy's case with several others known from the tablets, where certain individuals are said to be "attached to the house" (PF 1946). Rather than being a free itinerant craftsman, Hinzanāy seems to have become a dependent craftsman, whom Aršāma moves around at will in his own interest.

One of Aršāma's phrases, "*garda*—all kinds of artisans," is a virtual Aramaic calque of a Persian phrase known from a Treasury tablet (PT 79) in its Elamite calque (*kurtas marrip mišbazana*). But the lexical comparison provides no indication of the *garda*'s status; the word *garda* is used here in its generic sense of 'personnel'. The Cilicians, named in the second letter and in other documents, are included among these 'personnel'. In two documents they are described with sufficiently vague words (*bd*, *lym*) that they can be considered slaves as much as servants (DAE 66, 67 [AD 5, 6]). We do not know how the stewards recruited new "slaves": by purchase in Egypt, or at some other market after being captured in war? It is likely that a large majority worked in the fields, but the estates

of nobles also employed a staff with very diverse skills. A certain number — such as those who were assigned to Masapāta's wife — must have been domestic servants. All in all, the prevailing impression is that here the word *garda* is more a label than a technical term whose judicial status can immediately be defined. We may note in passing that *garda* owned personal property, since Neḥtiḥōr is accused of having taken some of it for himself (DAE 73 [AD 12]). We can conclude, however, that they were not free men but dependents and/or slaves who worked the lands and the estate for rations provided by the stewards.

Another fact needs to be brought up: the mention of a brand or mark that these people were required to wear. It is paradoxically via a passage in Quintus Curtius that we can indirectly establish a functional link between the Aramaic documents and the Persepolis tablets. Describing Alexander's arrival in 331, Quintus Curtius (like Diodorus) devotes a passage (meant to be moving) to the Greeks who had been deported to Persepolis and who, he writes, worked in the slave shops (*ergastules*). He adds an interesting detail: they were "branded with the characters of barbarian letters" (V.5.6♦). This practice is well known in Babylonia; just as slaves (*širku*) and the Eanna temple's flocks were marked with the goddess's star, private slaves were frequently branded with the name of their master. The only Akkadian text from the Fortification archives confirms this custom (Fort. 11786). A Babylonian document from Cambyses' time even states that the hand of a slave of Itti-Marduk-balātu "bears an inscription in Akkadian and [another] in Aramaic" (*Camb.* 143). Two other Aramaic documents from Egypt offer striking parallels. A case involving division of property among heirs mentions a male slave (*'bd*) whose hand bears a *yod* and an Aramaic word reproducing the name of the deceased owner (DAE 41 [AP 28]). Another letter confirms that slaves were branded on the arm with the names of their successive owners (DAE 22 [Bodleian ostrakon 1]). The information given by Quintus Curtius thus certainly appears to be legitimate. But should we conclude from this that every *kurtas* was branded? It is difficult to say. A passage in Herodotus nonetheless seems to imply that this was in fact the case for prisoners of war (VII.233: Greek prisoners marked with 'royal marks' [*stigmata basileia*]). What cannot be doubted, on the other hand, is that slaves proper (sold, bought, tattooed) are known from one of the two Akkadian tablets from Persepolis and, previously, from tablets from the time of Cambyses and Bardiya written at Matezziš (chap. 2/7). But in every case this concerns private slaves, who obviously had to be clearly distinguished from the *kurtas* belonging to the administration.

The word *kurtas* is also found in several Babylonian tablets, in the form *gardu*. But, as always, it is used allusively and erratically, sneaking furtively into contexts whose very logic most often escapes us and which always assume that we know exactly the thing we are hoping to find out. One document, dating to Darius I (between 507 and 500), states that *gardu* can be enrolled into the army reserve. The other attestations are later and appear in documents from the archive of the house of Murašū under Artaxerxes I and Darius II. What we find in these texts first is that *gardu* could farm plots of land that they had rented from the Murašū. We also find technical terms that are borrowed from the Persian vocabulary well known from Persepolis. We have terms such as royal *gardu*, for example, as well as a head *gardu* (*garduḫpatu* = *kurdabattiš*); another official has the title *pitipabaga* of the *gardu*, or 'distributor of rations in kind' (*ptp*) — a title recognizable from Dinon in the transcription *potibazis* (Athenaeus XI.503f = FG+H 690 F4). In two

documents, these officials levy taxes on lands of the royal prince worked by the Murašū, who have rented the land to *gardu*. The *gardu* are themselves hierarchically subordinate to three higher persons. One has the title *šaknu* of the *gardu*; on the model of the *segan* who oversee the *kurtasš* of the workshops in Persepolis, he was, as it were, their “foreman.” Another is called satrap (a very flexible term in the Babylonian documents). Both are royal officials. We are thus tempted to conclude that the nobles and the *gardu* who worked on the estates of the king and the nobility in Babylonia were organized on a socio-administrative model very like that of Persepolis: they received their rations from the royal administration.

At the same time, the Babylonian documents show that, in lieu of rations, other *gardu* received land to farm from within the *hatru* system. So it was, for example, for a *gardu* called Šalammanu. Elsewhere, the same person was called “*Gardu* of the fourth year of Darius [II].” This is a rather mysterious expression; one attempted explanation has compared this phrase with the use of the word *rabbap*, which at Persepolis modifies some *kurtasš*. Thanks to the Behistun inscription, the basic meaning of the word is fairly clear: ‘connected/attached/dependent’. It has been translated ‘conscripted’, a word that would qualify groups of *kurtasš* temporarily requisitioned for state corvées in Fārs. Of course, the corvée system is known in Babylonia. It is also known that, in the time of Darius I, Babylonians could receive orders to perform military service in Elam for a specified duration. But too much uncertainly remains to be able to be certain about the interpretation of the word *rabbap* in the (dim!) light of the Babylonian tablets, especially since in this example the mutual support the Persian and Babylonian documents seem to provide rests instead on circular reasoning.

Kurtasš and laoi: Tissaphernes and the Peasants of Parysatis's Villages

However allusive, a passage in Xenophon also deserves to be included in the discussion. After the Greek mercenaries retreated from Babylon, they arrived near “villages of Parysatis” (probably not far from Opis). Xenophon wrote:

Tissaphernes, by way of insulting Cyrus, gave over these villages—except that it was forbidden to enslave the inhabitants (*plēn andrapodōn*)—to the Greeks to plunder. In them there was grain in abundance and cattle and other property. (*Anab.* II.4.27)

Politically, Xenophon’s explanation fits well enough into the post-Cunaxa context, Tissaphernes being an enemy of Cyrus and hated by Parysatis. The prohibition he then imposes takes on a certain interest, at least giving us something to reflect on.

Among all the documents bearing on the *laoi* ‘common people’, we may cite the so-called Mnesimachus inscription (*Sardis* VII.1.1), which refers to a *dōrea* near Sardis. In the inventory are listed many villages (*kōmai*) and *laoi*, with each village paying a *phoros* to the military district (chiliarchy) to which it belonged. All the available documents testify that, even in the case of a donation, the peasants remained attached to their village, which, in Xenophon’s Armenia, was governed by a *kōmarch*, who was required to transmit the *dasmos* ‘tribute’ to the royal administration (*Anab.* IV.5.9–10, 24). Elsewhere, very often, the literary and epigraphic texts from Asia Minor confirm this arrangement, and it is implicit in Darius’s letter to Gadatas (ML 12): bound to their village, the peasants (*laoi*, *laoi basilikoi* ‘palace slaves’, *hierodouloi* ‘temple slaves’) are protected by the administration—in no case may they be captured or sold on the slave market (cf. chap. 12/4). We are then led to inquire whether this is the context that lies

behind Tissaphernes' behavior in Babylonia. Tissaphernes' behavior can be contrasted with Mithradates': to make his rebellion (*apostasis*) against the Great King obvious, Mithradates pillaged the villages (*kōmai*; Polyaeus VII.29.1; cf. Nepos, *Dat.* 10.2). Another example leaps to mind: we know that deeds recording slave sales in Babylonia regularly included a restrictive clause: the sale (duly registered in the royal archives) was only valid if the slaves in question were not royal slaves, free citizens, or temple oblates. If the comparison with the Babylonian example is valid, we must recognize that the villagers assigned to gift land also benefited from this kind of safety clause and thus that their sociolegal status was comparable to the status enjoyed by the *laoi* and *hierodouloi* known in Anatolia in the Hellenistic period and later.

To finish up on this point, we must also stress, nonetheless, that the conclusion just offered cannot be generalized. It cannot be applied to anyone other than the peasants who because of the concession of land continued to live in their traditional villages and cultivated their ancestral territories. Xenophon also refers to them in the *Cyropaedia*, composing the following speech for "Cyrus," who has just laid his hands on regions subject to the "Assyrians":

There are two things that it were well for us to look out for: that we make ourselves masters of those who own this property, and that they stay where they are. For an inhabited country (*oikoumenē khōra*) is a very valuable possession, but a land destitute of people becomes likewise destitute of produce. Those, therefore, who tried to keep you off, you slew, I know, and you did right. . . . But those who surrendered you have brought as prisoners of war (*aikhmalōtoi*). Now, if we should let them go, we should, I think, do what would be in itself an advantage. For, in the first place, we should not have to keep watch against them nor should we have to keep watch over them, nor yet to furnish them with food; . . . and in the second place, if we let them go, we shall have more prisoners of war than if we do not. For, if we are masters of the country, all they that dwell therein will be our prisoners of war; and the rest, when they see these alive and set at liberty, will stay in their places and choose to submit rather than to fight. (IV.4.5–8♦)

In other words, the tribute economy made it necessary to maintain the system of liberty-dependence that characterized the *laoi* so well. Hence the words spoken by "Cyrus" to the "Assyrian" prisoners:

You shall dwell in the same houses and work the same farms; you shall lie with the same wives and have control of your children just as now. But you shall not have to fight either us or any one else. (IV.4.10–11♦)

The comparisons with other corpora lead us to think that Xenophon merely transmitted a Greek vision of village dependence: the measure taken by Tissaphernes seems to be a concrete illustration of the policy attributed to "Cyrus." Booty was limited to harvest and stock, and the villagers are explicitly excluded; in the opposite case, the satrap would have negated the economic benefits granted by the king to Parysatis, since a gift of land without peasants was useless. This fact provides a measure of the distance from the status of the *laoi* to the status of the *kurtas*.

Immatam, ulhi, and Gift Lands (dōreai)

Similarly, we are tempted to compare the tablets with other documentary corpora to try to dispel some of the uncertainty surrounding the exact status of the estates (*immatam, ulhi*) allotted to princes, princesses, and high-ranking persons who belonged to Darius's inner circle.

As we have just seen from a passage in Xenophon, the Classical authors often testify to the existence of lands and/or revenues granted to Persian princesses. This holds, for example, for the revenue from the fish of Lake Moeris in Egypt, which Herodotus mentioned in his passage on tribute (III.91). Xenophon uses comparable expressions to describe the villages near Aleppo that belonged to Parysatis, wife of Darius II: "They had been given her for girdle-money" (*Anab.* I.4.9♦; cf. II.4.27). Likewise in Plato:

I once spoke with a reliable man who travelled over to the Persian court, and he told me that he crossed a very large and rich tract of land, nearly a day's journey across, which the locals called "the Queen's girdle." There's another one called "the Queen's veil," as well as many others, all fine and rich properties, each one named for a part of the Queen's wardrobe, because each one is set aside to pay for the Queen's finery. (*Alc.* 123b-c♦)

Many other ancient authors refer to this practice, which Cicero considered (pejoratively) to be specific to Oriental kings (*Verr.* III.33).

Whatever limitations there are on our use of Classical sources, in every case they explain that the princesses had lands and villages in various regions of the Empire from which they drew revenue that was allocated to their own house. Confirmation is found in numerous Babylonian tablets from the reigns of Artaxerxes I and Darius II that refer to houses (*bītu*), that is, estates assigned to members of the royal family (as well as to Persian nobles). We know in Artaxerxes I's time about an "estate of the lady of the palace" (perhaps one of the king's wives), as well as an "estate of the king's son" (*mār šarri*; reign of Darius II). Let us notice in particular several references to estates of Parysatis, among which we may quote the following:

60 KUR of barley, farm rent imposed, rent in kind of the lands [of Parysatis], (located) along the Addu-ab-usur canal, right [and left] banks, [from its sluiceway to] its mouth, where [its] water [flows out], from year 3 of Dar[ius the king, (lands) that (are) in the hands of] Mattani-lāma [slave of Ea-bullīšu the steward (*paqdu*)] of Parysatis, (and) who (are) [at the disposal of Rimūt-Ninurta son of] Murašū, the barley in question, [60 KUR, farm rent imposed on] these [lands] for year 3, [Mat]an[ni-lāma from the hands] of Enlil-itannu and Mu[ti]r-gimilli [treasurers] of Rimūt-Ninurta received, it has been paid; Mattani-lāma will have drawn up a receipt (for) 60 KUR, farm rent imposed on these lands for year 3 (and) coming from Ri- . . . and Ea-bullīšu the steward of Parysatis to Enlil-itannu and [Mutir-gimilli he will give (it)]. [Names of the witnesses and the scribe.] Nippur, 12-ix-3 of Darius. (PBS II/1.50; trans. after G. Cardascia)

Various estates allocated to Aršāma, prince of the (royal) house, are also mentioned between 425 and 404. If the tablets relating to Parysatis echo Xenophon and Plato, those citing Aršāma quite naturally remind us of several Aramaic letters from him when he was satrap of Egypt, where he also had estates (*bēt*; *DAE* 62-73 [AD 1-12]). In addition, he was not the only one: some documents refer to two other Persian nobles, Varfiš and Varohi, who also had lands in Egypt (*DAE* 71-73 [AD 10-12]). Of course, these documents are much later than the Persepolis tablets; nevertheless, the comparison with Babylonian tablets from the reign of Darius I leads us to think that the internal organization of the Babylonian estates did not change noticeably between Darius I and Darius II.

The translation of *bēt* (Akk. *bītu*) as 'estate' should not give rise to any confusion. Lands allocated to estates of this sort did not necessarily comprise a homogeneous territorial entity, set apart and individually identified as such in the countryside. These were not "rural estates" or manors surrounded by high walls. These "houses" included various cadastral elements, including *ḫaṭru* lands (bow lands, for example) and portions of 'royal

land' (*uzbarra*). This is also the picture portrayed in a Greek inscription from Sardis (*Sardis* VII.1.1) that lists the different elements of a *dōrea* of Achaemenid origin: the concessionaire was one Mnesimachus from the end of the fourth century and his allotment included villages, *klēroi* (military lots?), gardens for rent (*paradeisoi*), etc. This suggests that the king did not grant his family members and favorites rural farms in units as we would understand them: the administration allocated revenues to them from a certain number of cadastral units, which could be increased or diminished. The origin and status of the lands allocated in this fashion make it clear at the same time that the concessionaires—whether nobles or princesses—were not relieved of financial obligation to the king: even if *hatru* lands were granted to a prince of the royal house, they retained their original obligations, namely, various taxes and royal service (furnishing soldiers when called up by the king and/or the satrap). Likewise, the *dōrea* of Mnesimachus remained subject to the payment of tribute (*phoroi*) that burdened the villages and *klēroi* of his *dōrea*. This is the sense in which the accounts of the Greek authors preserve some of the institutional reality: what the king gave was not so much the land and the peasants but part of the revenue; in the eyes of a Xenophon or a Plato, the villages allocated to Parysatis represent nothing more than what is nowadays called a civil list. It was the same for the revenue from the fish in Lake Moeris. Even though they were grants, from the outset these concessions were clearly understood as revocable; they were not private property in the full sense.

That the grants were revocable does not imply that the beneficiaries did not actively concern themselves with managing them. In general, they entrusted management to stewards (*paqdu*), such as Neḫtiḥōr, Psammešek, Hatūbašti, or Masapāta in Egypt, or Lābāši, steward of the Babylonian estates of a royal prince, and Ua-buliṣu, steward of Parysatis. Their mission was to watch over the lands, property, and workers—and thus produce and revenues. In exchange for their services, they received grants of land (cf. *DAE* 69 [AD 8]). It thus was the responsibility of the beneficiaries to exploit their estates in such a way as to extract the maximum profit after deducting the taxes payable to the royal administration. This was in fact the goal that Aršāma and the other Persian nobles set for their stewards (*DAE* 68, 71 [AD 7, 10]).

Even when gathered in compact and incomplete form, these facts are incomparably more detailed than what can be extracted from the Persepolis tablets. Setting aside the word *ulhi* (which corresponds to the Akkadian *bitu*) and setting aside the status of the concessionaires (princesses), it is in fact difficult to build sturdy bridges between the various pieces of the documentary record. The relationships are only partial and uncertain. As an example, let us examine the data from a single tablet. It records the provision of travel rations to 71 'boys' (*puhu*) of Abbamuš and Irtašduna, servants "who transport a treasury (*kapnuški* = **ganza*) from Kerman to Susa" (PFa 14). Whoever the first of these two women may be (she is certainly high-ranking), the information is problematic. Another tablet (PF 1357) records the transportation of a treasury (*kapnuški*) from Babylon to Persepolis, but it is silent regarding the administrative background. There is a similar event in PF 1342 (a treasurer [**ganzabara*] transports silver from Susa to Matezziš). It is tempting to compare the first of these documents (PFa 14) with a letter from the satrap of Egypt, Aršāma, ordering the 'treasury' (**ganza*), consisting in part of the proceeds of taxes (*mandattu*) assessed on the Egyptian estates of the Persian nobles, to be brought to Babylon (*DAE* 71 [AD 10]). Perhaps Irtašduna and the other princess possessed estates

in Carmania, and the "treasury" designated either the revenues they extracted or else the proceeds of taxes they owed to the royal administration, or perhaps both at once.

The letter Aršāma entrusts to his steward Neḥtiḥōr (DAE 67 [AD 6]) wonderfully illustrates the ambiguities of the word 'house' (*bitu*). By sending him back to Egypt, the satrap entrusts him with nothing less than a travel voucher. Addressing the stewards in charge of the stations that lined the road from Babylonia to Egypt (from *medinah* to *medinah*), he required them to deliver to Neḥtiḥōr and his companions rations (*ptp*) taken "from his house (*bēt*)." But to what does this refer? The fact that the steward of his estates in Egypt (Neḥtiḥōr) and the stewards of the various cities involved had the same title (*peqid/paqdu*) does not imply that the duties of the two were the same. Nor does the fact that the personnel of Aršāma's estates also received rations (*ptp*) prove that the "houses" of Arbela or Damascus were assimilated to the satrap's Egyptian estates. For how else can we explain the fact that travel rations were taken from "private" funds, whereas the Persepolis tablets show that travel rations were provided by the administrators of state warehouses?

The tablets allow us to offer an answer, albeit a hypothetical one. These "estates" must have been comparable to *irmatam*, that is, estates whose status was at the convergence of private and public interests. We have seen that they functioned as centers for the collection and distribution of the products of owners who were exempt from *irmatam* assessments. We may suppose that the house of Aršāma had "credit" at Laḥirū, Arbela, or Damascus, which he was able to use to support activities in which his satrapal interests proper mingled with his personal interests. We can easily use the parallel example of the status of satrapal paradises. Here is how Pharnabazus reacted after the damage caused by Agesilaus's soldiers in his paradise at Dascylium:

And the beautiful dwellings and paradises, full of trees and wild animals, which my father left me, in which I took delight,—all these paradises I see cut down. (*Hell.* IV.1.33◇)

Pharnabazus's wording seems to imply that, from his perspective, the paradise had been transmitted to him by inheritance. In reality, what he had "inherited" was the position of satrap. The paradise was not his personal property; it remained attached to the position he held directly by royal favor, not from his father. But, as it happens, the practice of passing on the post within the family tends to obscure a basic fact: the paradise was an estate accompanying the job that, like the estates of Aršāma in Egypt, was located at the convergence of the interests of the king and the concessionaire.

10. The King's House

The King's Sheep, Camels, and Horses

But what are the circumstances underlying Darius's order to take 100 sheep from his house (*ulhi*) and provide them to Artystone (Fort. 6764)? The easiest answer is the most obvious, which is to suppose that the royal house was at the confluence of power in both the political and economic senses. This observation seems even more obvious when we consider that the order was given to Parnaka, who was in charge of managing production and the labor force in Fārs. In a letter sent by Darius to Gadatas, the steward of a paradise in Asia Minor, the Greek translation reads: "You will have great recognition in the king's house" (*en basileōs oikōi*; ML 12). The word is *oikos*, which is very close to Persian *viθ* and often was used by the Greeks to label what they thought of as the patrimonial

management system of the Empire. The same conclusion seems to emerge from the Babylonian financial formula “taxes paid, the king’s soldier, the king’s flour, the *bāra* and all sorts of rent for the king’s house (*bit šarri*).”

However, the vocabulary of the tablets prompts us to be cautious. We may briefly note that some texts refer to ‘royal shepherds’ (*batera sunkina*; PF 2025, Fort. 1091), “sheep of the king” (PF 775, 1442), “cattle of the king” (1946, 1965, 1991; PFa 32), “horses and mules of the king and princes” (1793), “royal horses” (1668–69, 1675, 1784–87; 1942), and a “horse of Ariaramnes” (PFa 24, 29). Some stable heads (*mudunra*) are “attached to the royal estate” (PF 1946^{73–77}) or else named as specifically dealing with the king’s horses (1765) or “horses and mules of the king and princes” (PF 1793). The lower courtyard at Persepolis (or part of it) is said to “belong to the royal warehouse” (PF 1797). Some lots of products deposited in the warehouses are also called “royal” (PF 150–56, 158–60), etc. One of the most interesting documents is a “transportation authorization” that records the passage of a considerable flock (more than 100,000 head) that was brought from Persepolis to Susa by about 700 shepherds (PF 1442), accompanied no doubt by scores of dogs (cf. PF 1264–66, 1904). This document certainly refers to *kurtaš*, since they are described as “belonging to the treasury” and the sheep are “royal sheep.” The same analysis may also hold for other tablets that mention the movement of flocks over long distances (PFa 31).

The question posed by the documentation is thus very simple—simple to formulate, at least. Why is the word ‘royal’ (*sunkina*) used in only a minority of cases? What does this word mean? Is it definitive, or simply a passing reference to a well-known fact? Were there other flocks and other shepherds that were not “royal” even though they belonged to the royal administration and received rations from it? Or should we think that the omission of the adjective *sunkina* has no particular significance and is due simply to the haste of the scribes, who had no need to specify what everyone knew? The latter notion is the opinion, for example, of the editor of the Fortification tablets, who in the tablets referring to delivery of products to warehouses inserts the word “royal” in some cases (PF 2–4, 30–32, 53, 378–83, 385–87) but not in others (PF 435, 459–60, 488, etc.). Meanwhile, there is nothing to prove that one of the words for warehouse (*huthut*) must always be considered to refer to a “royal warehouse.” Because the word *sunkina* describes some warehouses (PF 42, 133, 431, 533, 543, 650, 729, 1796–97, 1943^{15–16}) but not others, is it not more likely that not all of them are royal? And if some administrators were “named (*damana*) by the king” (1942^{23–24}), was it not because they had a privileged relationship with the royal house?

It is true that the reasons for the presence or absence of the adjective “royal” are difficult to bring to light. Why, for example, is the *baziš* called “royal” only once (PF 2025)? And why is another tax, the *ukpiyataš*, called “royal” only 6 of 13 times (PF 48–49, 388, 395, 396, 428)? We, like the editor of these texts, are obviously tempted to assume that the adjective is implicit everywhere. Comparison of parallel tablets sometimes permits us to observe that certain words were omitted by the scribe from one or the other. Umizza is called “royal shepherd” at Hiran in one tablet (PF 2070) and simply “shepherd” in a text from the following year (PF 2025), even though the context is exactly the same. We may also cite the captivating example of the 33 camels that were brought from Persepolis to Susa “toward the king” (PF 1787), then sent back to Persepolis a month later (PF 1786, PFa 26 and 29). In the first text they are called “royal” but not in the other

three, which, like an echo, record the flour rations they received on the return trip. And even the texts of these three tablets are not precisely identical: the destination is sometimes Persepolis, sometimes Matezziš (which is, to be sure, a suburb of Persepolis); the name of the official in charge is not always given, nor that of Bakabada, who gave the travel authorization. Nor are the purposes of the three tablets identical. In the general account (PFa 29), the scribe omitted certain details but added others, though we do not know just which documents lay before him. Whatever the case, it is not clear why some camels called "royal" on the inbound journey could have lost this characteristic a month later on the way back!

But the situation appears less simple as soon as we consider the longer series of texts. Of the hundreds of tablets recording rations paid to the *kurtaš*, only 4 refer explicitly to royal *kurtaš* (PF 1092, 1127, 1211, 2070²³⁻²⁵), and of more than 100 texts concerning rations given to horses, only 5 list rations to horses of the king or princes (PF 1669-70, 1775, 1784; PFa 24 = PFa 29). Some ration accounts make it look as though some of the rations were reserved for the "royal cattle" (sesame: PF 1991, 2082). But in the larger account books, feed for the royal cattle is only part of the total (PFa 32); this is especially clear in PF 1792, where Šuddayauda, the head of the *kurtaš*, addresses Parnaka through his superior, Harrena, and states that he has set aside 60 BAR of grain for cattle expressly identified as "royal." Similarly, in another general account (PFa 29), the rations allocated to "a horse of Ariaramnes" represents only a specific subgroup of a general account (cf. PFa 24) in which other horses received their travel rations. It states simply that the ration of 5 BAR of grain to which he is entitled includes his travel ration of 2 BAR. It is clear that this ration was much higher than that of other horses named previously (0.7 BAR). In other words, among all the horses fed by the administration, the royal (or princely) horses constituted a special, recognized category. This observation holds for sheep, poultry, and cattle that are called royal as well. We should especially note the description of some head stablemen (*mudunra*): they are "attached to the [royal] house" (PF 1946⁷³⁻⁷⁷), as others are "attached to the house of Hystaspes" (1956⁵⁻⁷; *viθ* = *ulhi*).

Two Economic Domains?

But if royal and princely houses really existed, distinct from the general administration, what was their relationship? In this regard, one tablet is particularly interesting. It says:

One ox, under the responsibility (*kurmin*) of Rumada, at the warehouse(?), [was] paid (*zakke*) to the king, [to] Anzamanakka. Year 19. Iškumipanna [was] the shepherd (*batera*). (PF 692)

The editor includes it among the texts referring to deliveries to the king, specifically, in fact, to the royal table (PF 691-740). Despite clear onomastic connections with the next tablet (PF 693) and translation difficulties, it *may* have to do with a completely different operation. The word *zakke* is fairly rare in the tablets and its usage is ill defined. In some cases, *zakke* has to do with distributions to *kurtaš* (1178-81, 1986-87: "He paid [amount] to [specified] *kurtaš*"), but we cannot clearly distinguish a difference from the ordinary distributions (though there certainly must have been one!). In four cases, *zakke* involves "purchase" by an administrator of an animal in exchange for grain (PF 1976-78, 1980), thus apparently referring to transactions between two warehouses. This is perhaps what is going on: the document seems to mean simply that on one occasion an ox

was requisitioned from administration livestock and transferred to the royal estate (perhaps in a trade). If so, this could be how an ox became “royal,” with the named shepherd being either the royal shepherd who received the ox in the name of the king or (more likely) the warehouse shepherd. It must have been a fairly common operation that allowed the men in charge of the royal herds to (re)build their livestock with carefully selected animals. One tablet (PF 198732) seems to report that administrators exchanged grain for sheep that were then transferred to the royal house (*ulhi sunkina*) and placed in the care of a shepherd, no doubt one in charge of royal flocks. Another states that Darius’s shepherd received 55 animals from the *irmatam* of Irtuppiya, in Parmadan (Fort. 1091).

Let us return to the particularly interesting example of Umizza, a ‘royal shepherd’ (*batera sunkina*) whose situation is very clearly spelled out in one tablet (PF 2070): “Umizza, son of Halpa, who lives in Hiran, in [the district] called Halkukaptarriš.” He appears in two tablets dated to different years (504 and 503) but reflecting the same context, since the same administrators’ names are found in both (PF 2025 and 2070) and both deal with the collection of *baziš* (labeled “royal” once: 2025). In each case, Umizza receives sheep and goats, while others were delivered to the local “head of flocks.” If, as seems logical, a royal shepherd deals with royal sheep, we can conclude that some (small: less than 1/10) part of the sheep and goats resulting from the *baziš* (and not immediately slaughtered) was requisitioned yearly to rebuild the royal flocks, the rest going quite naturally to the heads of the administration’s flocks.

Other transfers between royal property and the administration’s property are attested. In some cases, “royal” products were placed in reserve in the paradise warehouses (PF 150–56, 159–60). On one occasion, royal grain was reserved for seed to be divided among four officials, including a head stableman (*mudunra*; PF 440). Much more numerous are the documents that describe providing the king or his family members with various products from the warehouses. The products in question could be delivered to a royal warehouse: wine (PF 42, 729), grain (PF 1796, 384(?)), fruit (PF 133), as well as animals (PF 1797: horses). Sometimes, grain or sesame is “set aside” “in the royal warehouses(?)” (PF 533, 543) or simply “for the king” (PF 1846). The fruit deposited in this way sometimes comes explicitly from levies assessed on the surrounding villages (PF 650). We have also seen that “royal” animals were frequently fed from the administration’s reserves. This was the case for an enormous flock of royal sheep that was taken to Susa by *kurtas* “attached to the treasury” (PF 1442). Another series of tablets (PF 691–740, 2033–35) records the provision of foodstuffs in the course of relocations of the king or members of the royal family: Irtašduna, Arsames, Irdabama (PF 730–40, 2035), or even Darius’s sisters (PFa 5, 31).

Parnaka, Persia, and Darius

We have seen that the royal inscriptions reserve a separate position for Persia among the peoples (*dahyāva*) ruled by Darius. Herodotus, for one, confers a special tribute status on it in a passage (III.97) in which limitations and gaps have already been highlighted. A priori, the special place of Persia within the Empire does not imply ipso facto that it was devoid of any state administration. But we cannot be sure, since the documents do not deal directly with the problem of territorial administration of the country raised by some Persepolis tablets.

Nevertheless, the special status of Persia raises the question of the place of Parnaka. Did he exercise a sort of economic high command, with the right to intervene in the strictly political realm? We have no clear reference to a satrapy in Persia at the time of the first kings. Three times, the tablets refer to "satraps" (PF 679–81). They record the payment of rations to three people; the first two are called "satrap carrying out his duties at Makkash"; the third is referred to as "satrap carrying out his duties at Pura(?)." The rations of wine and grain that they received are unusually high. But this information cannot be used to define their status; in fact, these rations were travel rations probably used to feed members of their entourage (even though they are not mentioned; cf. PFa 4, PFT 23). If they really were satraps in the administrative sense (and the label not just a generic title), they seem nevertheless to have carried out their duties far from Persia.

The Classical texts are silent. The information given by Herodotus on the duties of the "governor" (*hyparkhos*) of Persia, the duties that Hystaspes is supposed to have performed before 522, is clearly erroneous (III.70; cf. DB §35). Not until the time of Alexander is any information available, and not until then do we learn that there was a satrap of Persia, Ariobarzanes; again, it is important to stress that only Arrian uses this title (III.18.2), which is not without its own problems of interpretation. At this date, there was also a garrison guarding Persepolis, and Persia was peppered with citadels that Alexander had to overthrow by force. We also learn that someone called Tiridates was 'guardian of the royal fortune' (*custos pecuniae regis*) and that another Persian, Gobares, was 'prefect' (*praefectus*) of Pasargadae. Diodorus says of Tiridates that he "governed the town" of Persepolis, probably in the absence of Ariobarzanes, whom he forbade to reenter the town because he himself was negotiating with Alexander. All the same, he turned over to the king the treasury that he guarded (cf. chap. 16/12). Tiridates' Persian title would have been *ganzabara.

At first sight, the information given by the Hellenistic authors does not contradict the (scarce) information gleaned from the tablets. First of all, the citadels are mentioned many times. The citadels (*halmariš*) were not solely centers for collection and redistribution of products derived from taxes on the countryside but also—doubtless originally—full-fledged military sites that also served as relay stations for the transmission of acoustic signals (Diodorus XIX.17.6: *phylakai*). Two tablets (PF 1591, 1812) list the payment of rations (beer, grain) to the 'guards of the fortress' (*halmariš nuškip*), including the one at Persepolis; in one case, the group consisted of three squads (10, 20, and 70 men), each headed by a named commander. These soldiers are to be distinguished from the *kurtas* attached to the workshops of a treasury (*kapnuškira*) or the *kurtas* who oversaw the workshops (PF 874), as well as from the guardians of the paradises or rural estates, who are also *kurtas* (*puhu*).

Limited as it is, this information proves (if that were necessary) that the garrisons revealed in 331 had not suddenly been positioned to stave off the Macedonian advance. But by itself this information does not permit us to conclude anything regarding the political status of Persia in the time of Darius I. What is problematic, obviously, is that no satrap is ever cited in his official capacity in the tablets among the high-ranking persons who receive rations. It is true that the absence of any title connected with the name Parnaka is a basis for nothing more than an argument from silence; and this argument is less definitive, obviously, than the approach proposed by some interpreters, who refer to some as satraps who never had the title because of the role they played in the distribution

of *halmi* to travelers who used the royal roads. Nevertheless, the argument from silence is not without value, because, as we have seen, the word *satrap* is present in the Persepolis archives.

The tablets also inform us of the existence of several bodies of administrators entrusted with judicial tasks. Three tablets refer, for example, to *šamidakurra*, a word that is sometimes understood as “peace officers/conciliators” (PF 1311, 1374, 1461). Other persons seem to perform the functions of police. One tablet (PF 1272) reports the delivery of wine rations to a certain Bakabada, called “judge (*databara*) of Parnaka.” Since he received rations for 20 days, it is likely that his job took him from one place to another within Persia. The expression “judge of Parnaka” should occasion no surprise. The same construction is found in Babylonian tablets—as in “*dātabaru* of Artareme,” a person who clearly carried out official duties (Artarius/Artareme was satrap of Babylonia), or the “judge of Gubāru,” satrap (or high administrator) of Babylonia at the time of Darius II.

From Aelian (*VH* I.34) we know of the existence of itinerant judges in Persia at the time of Artaxerxes II. However, the tasks of Bakabada appear different in kind. There is no proof that Bakabada actually was an official acting on the spot in the name of a satrap. This theory, in fact, would not help us understand why the tablets never give Parnaka the title of satrap; he is never so identified. Parnaka’s duties were very wide-ranging, but at the same time they were limited to the administration of property and government workers. This is undoubtedly the context in which the “judge of Parnaka” operated. It seems likely, in fact, that in administrative usage the word *dāta* ‘law’ referred to rules governing the behavior of bureaucrats, including their calculations of their fiscal accounts (PF 1980). It is thus likely that Bakabada, in the name of Parnaka, was given the task of ruling on disputes internal to the administration and ensuring that accountants and warehouse heads adhered to the rules and obligations of their positions. In this sense, the relationship between Bakabada and Aelian’s itinerant judges must not lead us to identify the former’s job with the missions assigned to the latter: Bakabada was part of the general administration; the others belonged to the royal administration. The modesty of his daily ration (less than a liter of beer) does not lead us to attribute an eminent position in the administrative hierarchy to him. From all this, we can firmly conclude that Parnaka had neither the title nor the responsibilities of a satrap, insofar as we define these based on our analysis of the satraps located in the various provinces of Darius (cf. chap. 12).

Two further observations may be added to this one. First, it is doubtful that the great aristocratic Persian families would have been subject to the same administration that was responsible for the life and work of the *kurtaš*. Their way of life was more “tribal,” in the sense that Herodotus lends to the Persian *genē* (I.125), than territorial. At this point we should recall that Quintus Curtius writes of Orxines in 325: “From there they [Alexander and company] came to Pasargada; that is a Persian race (*gens*), whose satrap was Orsines” (X.1.22♠). Of course, Quintus Curtius’s terminology is not certain. The continuation of the story shows that Orxines was the head of the tribe of Pasargadae. But at the same time, in every language, the administrative content of the word *satrap* itself is uncertain. All things considered, it would not be inconceivable for the title to be borne by the chiefs of the great aristocratic families that doubtless controlled the peasants who worked on the land attached to the tribe. Whatever the reality of this (secondary) terminological usage, it is reasonable to think that alongside the territorial division belonging to the administration headed by Parnaka, the old division familiar to the Persian clans

and tribes continued to operate, whether their chiefs did or did not bear the title "satrap." Furthermore, within the civil society of the Persians, the name of the tribe continued to be linked to the name of the ancestor, as seen in the example of "Masdayašna of the Maraphi" (PF 1797) and the (contemporaries) of Amasis of the Maraphii and Badres of the Pasargadae (Herodotus IV.167). According to this theory, the later creation of the position "satrap of Persia" significantly reinforced royal power in Persia itself at the expense of the hereditary chiefs of the tribes; but too many uncertainties remain on this point to be able to sustain such a theory.

We should also keep in mind that the geographical and political area covered by the Persepolis tablets does not include all of Persia. The Persian *ethnos* included subgroups located on the margins of the royal domain itself. While some of these groups, such as the Sagartians or the Yautiyans, are listed by Herodotus among the tributary peoples, others are not—in particular, the Mardians and Uxians. The former lived in the mountains not far from the heart of royal power, the latter in the mountains abutting Susiana and Persia, close to a region firmly administered by the royal administration, the basin of Fahliyun. Both populations were short-ranging nomads connected with basic valley agriculture. For example, "the mountain Uxians" are described thus by Arrian: "They had no money or arable land, but were mostly herdsmen (*nomeis*)" (III.17.6♠). The amount of annual tribute imposed on them by Alexander reveals the extent of their livestock: 100 horses, 500 pack animals, and 30,000 sheep (Arrian III.17.6). They were neither tribute-payers nor donors; on the contrary, it was the Great Kings who paid them gifts or tribute when they crossed their territory, according to the Hellenistic authors (chap. 16/11). In sum, one conclusion seems inevitable: not all of Persia was managed directly by the administration headed by Parnaka.

Royal House, Persia, and Empire: A Hypothesis

When Darius ordered that 100 sheep be delivered to Irtašduna from his house (*ulhi*), we are tempted to suppose that he was not referring generically to property managed by the administration but rather that he was instructing Parnaka to charge these animals to a specific account. The orders given by Irtašduna, Irdabama, and Arsames to charge merchandise taken from their house (*ulhi*) and designated for specific persons seem to be a similar case. It is perhaps possible to locate traces of a royal house distinct from the general fiscal administration in the Classical texts. We know that when the Great King relocated, he was accompanied by his entire court, including a treasury transported by hundreds of animals. Of course, it is not certain that this treasury could be confused with the treasuries kept in the capitals of the Empire—the very treasuries Alexander seized in 331–330. This at any rate is what is suggested by a passage by Chares of Mytilene, quoted by Athenaeus in a long discussion of the *tryphē* of the Persian kings:

Near the royal bed, beyond the head of it, was a chamber large enough to contain five couches, wherein were stored 5000 talents of gold coin filling the whole, and it was called the royal cushion. At the foot was a second, three-couch chamber, containing 3000 talents in silver money, and called the royal footstool. (XII.514e–f♠)

This text reveals the formulas commonly employed by the Greek authors to designate the revenues assigned by the king to the official list of Persian princesses (the veil, the queen's slipper, etc.). The comparison is interesting; in fact, it suggests that the king had

a treasury available for his own needs that we should not confused with the treasuries managed by the treasurers appearing in the Persepolis tablets.

This interpretation is based on the distinction we suggested between *tagē* and tribute-producing land (chap. 10/7). Although all of the territories—what we call the Empire—belonged to the conquering king (by way of tribute assessments), parts were reserved for him (the *tagē*) as *dōrea* for the specific needs of his own house. It is our suggestion that Persia itself was organized on the same model—namely, within the country, we can distinguish the territories of the *ethnē*, the estates of the nobles (established by inheritance and/or by royal gift), the lands managed by the administration, and the royal land (taken in the restricted sense implied by the word *tagē* in Pseudo-Aristotle). The *tagē* is the phenomenon referred to by the tablets naming the royal *ulhi*, otherwise known as the royal house (*oikia basileōs*). This Persian royal *tagē* was indeed a *dōrea* in Pseudo-Aristotle's sense—that is, it was not distinguished in the landscape of the administration's land. Lands and villages were assigned to the royal house, and they undoubtedly were also managed by their own stewards. Revenues from these properties fed the personal treasury of the sovereign and permitted his patrimony to flourish. Darius told Parnaka to charge the 100 sheep he gave to Irtašduna to this account. Our hypothesis—which we offer here solely for the purpose of discussion—implies that the king was not only the master of the Empire but that he also had a separate life as a private person or, rather, as the head of a house (*ulhi*); its funds are not to be confused with what is normally called the royal economy.

The ambiguity of the vocabulary perhaps reflects the ambiguity of the situation, which simultaneously distinguishes and confuses. The sense of the word *ulhi* cannot be reduced to a rural estate, in contrast to a working estate (*imatam*), of which the satrapal paradise is a well-known example. Originally, the royal house must have consisted of family property—just like any aristocratic house (*oikos*: Herodotus III.119; chap. 8/4). In principle, the king's house was sustained by the produce coming from the part that, etymologically, means 'the king's part', paid to the king in the form of a "gift" according to a process that is probably distantly echoed in the *nomos persikos* so carefully defined by Aelian (VH I.31; chap. 10/3); this is in fact the original meaning of *baziš*. This "division" must be very ancient, since the word *baziš* appears in the name of the fifth Persian month (July–August), **drnabaziš* 'month of *baziš* on the harvest'. During the course of reinforcement of royal power, only the word *baziš* remained, though it came to signify only one of the financial levies.

This hypothesis does not imply the existence of two rigidly distinct economies. It was Parnaka whom Darius ordered to take sheep from his *ulhi* and transfer them to Irtašduna's account. In fact, the king's house had resources other than the income from particular estates. Every year, part of the produce or profit was set aside and placed in a special account belonging to the king's house. Despite the activity of a staff "attached to the king's house," many functions were carried out by administrators working directly for Parnaka. The royal shepherd Umizza himself appears to have had (unclear) hierarchical relationships with Miššumanya, who, on the authority of Harrena (PF 2025, 2070), had responsibilities in the administration of herds (PF 267, 2012). What makes the interpretation so difficult is that the houses—royal and princely—are included at the same time and in different forms within the purview of the royal economy, because it was precisely from the king that princes and princesses enjoyed the revenues of their houses, in the

same way that Parnaka's authority derived from royal delegation. Somehow, by virtue of his position, Parnaka found himself at the intersection of the two spheres that the king dominated without making a clear distinction between them. At this point, it is tempting to think that this was the reality hinted at by Darius when he simultaneously distinguishes and combines in a condensed formula the two elements that are his country (*dahyu* = Persia) and his house (*viθ* = *oikos*; cf. *DPe*, *DNa*).

From a historical point of view, we may ask, finally, whether the ambiguity of the vocabulary also accounts for the (difficult and conflicting) gestation and development of state bureaucracy, originating from a world that was, in the end, considered to be the personal property of the sovereign. Within the dynamic of tribute, the ideological representations and the politico-economic realities were fused because, by means of tribute, gifts, and assessments, the Great King revealed and exercised his unshared authority not so much over the lands themselves as over the wealth they produced through the labor of his subjects.

11. Transition

As viewed by a Greek author writing toward the end of the fourth century in Asia Minor, the structure of the royal economy was very much the same as the operation two centuries earlier in Fārs or Achaemenid Egypt. Analyzed in light of the Persepolis documents, the regional corpora show an undeniable internal coherence. This conclusion has the advantage of restoring an imperial universality to what is usually considered a simple reporting of local income. In particular, we have seen the considerable contribution of the Aramaic documents from Egypt to the discussion. Indeed, there is no decisive historical reason to consider Egypt a special case within the Empire. On the contrary, the evidence from Egypt fully reveals the limitations of the argument that would mechanically link the quantity of documentation with the degree to which a country was integrated into the imperial structures. Actually (and noting that the quantity of evidence is purely accidental), Egypt was the only country that succeeded in detaching itself politically from the center for two generations? Despite gaps in the documentation, and whatever the extent of local peculiarities, we may reasonably suppose that the management of royal property was organized identically in every satrapy in the Empire. The obvious concurrence of the analysis by Pseudo-Aristotle, the information in the Egyptian and Babylonian documents, and the Persepolis model leads us to think that this organization had been in place since the time of Darius.

These observations do not necessarily imply that the installation of an imperial administrative machine always obliterated local traditions, particularly in the socio-economic and cultural realms. It is clear, for example, that the existence of a category called *gardu* did not obliterate other categories of worker in Babylonia. In the Achaemenid period, as before, we encounter in Babylonia as many free laborers and owners as slaves proper and groups of dependents (often linked to the economy of the sanctuaries), whose status, to repeat the famous formula of the lexicographer Pollux, puts them "between free and slave." In other words, the approach adopted here does not eliminate regional approaches; it makes them still more necessary. The inquiry has already been initiated in the course of the previous chapter (chap. 10/7). It will now be pursued more systematically.

Chapter 12

The King of the Lands

1. Darius and Egypt

Satrap and Satrapy

Our sources on Darius's policy in Egypt are abundant and varied. The texts (Egyptian, Aramaic, Greek) and the archaeological data (statue of Darius, paintings and sculptures, stelas, *naoi*) eloquently testify to Darius's varied activity on the shores of the Nile and in the Eastern and Western Deserts: sanctuary-building, codifying "Egyptian law," digging a canal between the Nile and the Red Sea, and so forth. Whatever uncertainties remain about the conditions leading to Egypt's revolt in 522, it is clear that Aryandes was confirmed as satrap by Darius at that time and that he ruled at least until 510, the date when he was deposed and put to death under conditions that Herodotus's narrative (IV.166) does not fully clarify. In fact, Demotic texts show that in 492 Pharan-dates assumed the role of satrap (*Berlin P.* 15339-15340) until later, in 484, when Xerxes installed his own brother, Achaemenes, in Egypt (Herodotus VII.7).

After the conquest by Cambyses, the Persian satrap held court in Memphis, the site of the offices and various administrative branches. The citadel, or White Wall (*Jnb hd*), was held by a garrison of Persians and auxiliaries, and in order to support them, the Egyptians had to pay 120,000 bushels of wheat in addition to tribute (Herodotus III.91). The basic territorial organization (villages, nomes) underwent no apparent modification. But, under the supreme authority of Memphis, Egypt itself was divided into a number of districts that the fifth-century Aramaic texts call 'provinces' (*medinah*). The Aramaic documents show that the southern district (Tšetrēš) had Elephantine as its capital and was distinct from the province of Thebes (*DAE* 55 [AP 24]). A garrison was stationed at Syene-the-Fortress and, opposite it, on the island of Elephantine. At the top of the hierarchy, but dependent on the satrap, we know of the *frataraka* 'governor' who lived on Elephantine, while the garrison commander (*rab ḥaylā*) lived in Syene. The first garrison head we know of appears in an Aramaic papyrus dated 495, a contract among three women of Jewish origin; the first two women refer to "half the share which was granted to us by the king's judges and Ravaka the commander" (*DAE* 2 [AP 1]). "Commander" was undoubtedly also the position held by Parnu (a Persian or Iranian), who is named in Demotic papyri dated 487 and 486; he was designated as the "representative of the southern district, to whom the fortress(?) of Syene is entrusted" (*Berlin P.* 13582; *P. Loeb* 1).

In all probability, Ravaka's decision involves a part of the share (*mnt*) allocated by the administration to the soldier-colonists of Elephantine, which also involved rations in the form of foodstuffs (*ptp*) and weighed silver (*prs*). The intervention of the Achaemenid authorities in civil and/or private judicial affairs is frequently attested. For instance, in a petition (ca. 410) the members of the Jewish community in Elephantine demand that "an inquiry be conducted by the judges, the police, and the informers (*gaušaka*) in charge of the Southern District province" (*DAE* 101 [AP 27]).

The troops and garrison at Syene-Elephantine, just above the First Cataract, had to maintain order as part of their brief and at the same time had to guard the southern frontier with Nubia. The Nubian frontier, however, was not particularly close, as we infer from one of the documents mentioning Parnu that refers to a convoy of wheat coming from south of the First Cataract (*P. Loeb 1*).

Udjahorresnet's Return to Saïs

Overall, the Egyptian documentation testifies to a fair degree of continuity from Cambyses to Darius. Our earliest evidence—partial, to be sure—comes from the biography of the famous Udjahorresnet, whom we saw in action after the conquest of the country in 525. It appears that he accompanied Cambyses when he left Egypt in 522 but then found himself in the entourage of Darius, who soon sent him back to the Nile Valley (fig. 44). He writes:

His royal Majesty of Upper and Lower Egypt, Darius, may he live forever, ordered me to return to Egypt—while his Majesty was in Elam, when he was Great King of all the foreign countries and great sovereign of Egypt—to put back in order the institution of the scribal bureau . . . after its

destruction. The barbarians carried me from country to country and eventually brought me to Egypt, as had been ordered by the Lord of the Double Land. (Posener no. 1E)

Thus, like Nehtihōr, steward of Aršāma, who returned to Egypt “through province after province” (*DAE 67 [AD 6]*), Udjahorresnet, armed with a royal authorization, used official services to return to the Nile Valley “through country after country.” There, he writes, he restored an institution for teaching medicine (House of Life), providing the students with all they needed to pursue their studies, “as it had been before.” And the Egyptian specifies: “His Majesty did this because he knew the usefulness of this art for reviving every sick person.” We have indeed seen that Egyptian physicians were highly regarded at the Achaemenid court (chap. 7/2); it is they who were brought to Darius when he suffered a major sprain while dismounting from his horse during a hunt, since they “had a reputation for the highest eminence in their profession” (Herodotus III.129◊). Udjahorresnet stresses that the work of restoration undertaken at Darius’s initiative encompassed the entire sanctuary of Neith at Saïs: “His Majesty did this . . . to preserve the names of all the gods, their temples, the income from their *wakf* properties, and the observance of their festivals, for all time.” In Udjahorresnet’s eyes, Darius thus continued the work of Cambyses, who had manifested a pronounced piety toward the goddess Neith.

Fig. 44. Statue of Udjahorresnet.

Darius and the Egyptian Laws

It was just about the same date, 519, that Darius sent a letter to his satrap in Egypt, which we know (in fragmentary form) from a text on the back of the *Demotic Chronicle*. Darius ordered his satrap to assemble Egyptian sages, chosen from among priests, warriors, and scribes. They were instructed to gather in writing all of the old laws of Egypt down to year 44 of Pharaoh Amasis, that is, 526—the eve of the Achaemenid conquest. The commission worked for sixteen years (519–503) and produced two copies of its work, one in Demotic, the other in Aramaic.

The text does not detail the exact content of the book that they produced. It simply distinguishes “public (or constitutional) law,” “temple law,” and “private law.” It is helpful to compare this text with other papyri of the Ptolemaic era that may have been composed on the model of Darius’s code. One of them, in Demotic, is known as the “legal code of Hermopolis West.” More than a law code in the strict sense, it is a collection of legal precedents dealing basically with leases and property disputes. The judge could easily find the path to follow in each case that might turn up. It is practically certain that these collections were edited by religious personnel, who had available to them documents preserved in the Houses of Life—such as the one that Udjahorresnet restored at Saïs.

Pharandates and the Sanctuary of Khnūm at Elephantine

Settling disputes apparently was a common role for Darius and his governor in Egypt and so it is that they came to intervene in a matter of the sanctuary of the god Khnūm at Elephantine later on, in 492–491. Two Demotic letters found at Elephantine attest to relations between the administrative council of the sanctuary and a man called Pharandates, “to whom Egypt is entrusted” (*Berlin P. 15339-15340*). This cannot refer to anyone other than the satrap, the successor of Aryandes. The matter in question was the naming of a *lesonis* at Elephantine; the *lesonis* was not strictly a priest but an administrator of temple property—comparable, as it were, to the *neocore* [administrator] of a Greek temple. In the first letter, Pharandates reminds the college of priests of Khnūm of the conditions (social and moral) required of candidates for the post and for being considered “in agreement with what Darius the pharaoh commanded.” Eight months later, the priests of Khnūm wrote to Pharandates. Without referring directly to the satrap’s previous letter, they let him know the name of the one they had chosen.

The intervention of Darius and his representative in Egypt was thus not onerous. To judge by the chronology of the letters and their content, the people of Khnūm did not, strictly speaking, submit their candidate for the approval of the government; all they did was to communicate the name of their choice to the satrap. Pharandates was satisfied with the prior reminder that the choice had to conform to conditions known to both sides. There is no doubt that in doing this, Pharandates was simply reprising a role that traditionally was the responsibility of the pharaoh, a fact that is reflected in the name “Darius the pharaoh.”

Furthermore, the well-known text called the *Petition of Peteisis* seems to record limits on the exercise of royal power in these domains. In the ninth year of Darius (512), Peteisis III was imprisoned by Ahmose, who had come to make an inquiry at El-Hibeh (Teuzoi) alongside the *lesonis* Zeubestefonk, son of Jenharou. Peteisis was a temple scribe at the time. His report was forwarded to the governor (the satrap of Memphis?). A little later, Pkoip came to El-Hibeh, where he denounced Peteisis before the priests. More-

over, "He relieved the *lesonis* of his duties, threw him in prison, and bolted the door of our prison. Subsequently he replaced the *lesonis* with Jenharoui, son of Petehapi." After many difficulties, Peteisis gained an audience with the governor, to whom he brought charges regarding the activities of the priests of Teuzoi. On his return, Peteisis found his house burned down. The governor then convened the priests at Memphis. Only the *lesonis* responded to the summons. He was punished with fifty strokes of the rod, but finally he was allowed to return to Teuzoi in the company of Peteisis who, despite the promises of the *lesonis*, was unable to assert his rights (P. Rylands IX).

Darius in the Temple of Hibis (El Khārga)

Darius's activity as builder is easily spotted at a number of locations in Egypt. At El-Kab, the imperial sanctuary of Upper Egypt, where the new Horus, the pharaoh, received the white crown, the temple was rebuilt by Darius. On a counterweight found at Karnak, the king bears the epithet "beloved of Haroëris," who was the lord of Upper Egypt. A fragment of ritual furnishing also bears an inscription in the name of Darius. More recently, in the same sanctuary, a half-drum of a column inscribed with the name of Darius has been found: "He who performed the rites, the king of Upper and Lower Egypt, Darius."

The presence of Darius is particularly significant in the oasis of El Khārga, about 200 km west of the Nile Valley on the same latitude as Luxor. An Egyptian-style temple has been found there, the only intact Egyptian-style temple known from the New Kingdom to the Ptolemaic period. The initial work there was done by the last pharaohs of the Saite dynasty, but most of the construction dates to Darius. Decorated with representations of hundreds of Egyptian deities, the sanctuary was dedicated primarily to Amon-Rê. Darius is shown as pharaoh many times, wearing the crowns and traditional appurtenances, presenting various offerings to the gods and goddesses of the Egyptian pantheon (incense, wine, water, land). Two hymns to Amon are inscribed there, as well as a hymn to the Sun that the king recited in the course of the ceremonies. Darius is saluted in it as follows: "The Master of the diadems, son of Amon, chosen of Râ . . . , the gold Horus 'Lord of the Lands, beloved of all the gods and goddesses of Egypt; king of Upper and Lower Egypt, 'ray of Râ; Râ's own son who loves Darius, may he live forever, beloved of Amon-Râ, lord of Hibis, great god rich in vigor, may he live forever." On the exterior wall, several inscriptions celebrate Darius's work as a builder. Amon-Rê manifested his satisfaction as follows:

Amon-Rê, his disk appeared in life-power in the morning, illuminating the Two Lands with the splendor of his eyes. . . . The gods are cheerful. He has seen the precious, splendid, and comfortable chambers of his temple. There is no other prince who is great like the king of Upper and Lower Egypt. Son of Rê, Darius, sovereign of all the princes of [all] the foreign countries. He [made] this as his monument to his father Amenebis, great god, powerful of arms, by making for him . . . of good white stone from Meska, place of eternity, whose walls were founded by Sechar, built with labor perfect for eternity, whose decoration was executed by Resi-inbef, who created the beauty of its gates, and in which the Sun shines for ever and ever.

Many reliefs portray privileged links between the gods and the pharaoh, who in this case was Darius. For example, four panels mounted on the east wall of hypostyle hall B show Darius and several specific gods: Mut takes the king's hand and gives life to his nostrils; we also see the god Imy-wet extending his scepter toward Darius's nostrils; below,

Darius is embraced by Isis, who addresses him as her well-beloved son. Furthermore, the goddess Neith of Saïs nurses the young Darius while Hathor of Hibis holds him by the arms. Two inscriptions explain the scene: "Words spoken by the great Neith, the divine mother, lady of Saïs who presides at Hibis," and (behind her): "Take, O youth, her nipples with your mouth; she is the powerful one who heads Saïs." The same scene is repeated in room L of the sanctuary: "Words spoken by the great Neith, lady of Saïs: "I suckle your body with [my] milk, in such a way that you gather the Double Land with all the *Rekhyt* [subject peoples] to your breast, O my son!" Elsewhere (hypostyle hall N), it is Mut who nurses Darius. This well-known pharaonic rite confers divine status on the new king.

Darius at Heliopolis

A recently published object, a statue of Darius (fig. 19), was eventually placed at the entrance to the Gate of Susa known as the "Darius Gate." However, a statement by Darius himself makes it clear that the statue came from Egypt, where it had been carved. Engraved on the segments of the belt, the folds of the tunic, and the edge of the base are four hieroglyphic inscriptions. One of them refers to:

The portrait made in the exact image of the perfect god, master of the Two Lands, which His Majesty had made so that a monument to him might be permanently established and so that his appearance might be remembered before his father, Atum, Heliopolitan lord of the Two Lands, Râ-Harakhte, for all eternity. May he accord to him in return all life and all power, all health, all joy, as Râ [enjoys].

The longest inscription underlines still more clearly the links between Darius and Atum, even as it intermingles Pharaonic and Persian titulary:

The king of Upper and Lower Egypt, master of the Two lands, Daraywesh, may he live forever! The great king, the king of kings, the supreme lord of the earth [in its totality, the son of the] father-of-a-god Wishtapa [Hystaspes], the Achaemenid, he who appeared as king of Upper and Lower Egypt on the seat where Horus reigns over the living, like Râ at the head of the gods, eternally!

The god confers a universal power on Darius:

I give you all the countries of plain and mountain united under your sandals. I give you Upper Egypt and Lower Egypt, who address adorations to your handsome face, as to Râ's, eternally.

Darius's Pharaonic Reputation

In every case, the Classical sources paint Darius as a pharaoh highly respectful of the customs of his Egyptian subjects, in contrast to the behavior of Cambyses. Thus the statue of Darius from Susa makes us think of what Herodotus (II.110) and Diodorus Siculus (I.58.4*) wrote of relations between Darius and the priests of the sanctuary of Hephaestus [Ptah] in Memphis. This sanctuary, according to the Greek authors, is where reliefs extolling the exploits of the pharaoh Sesostris, who was famous for his Asiatic conquests, had been placed. Darius wished to place his own statue above the statue of Sesostris. The priests would hear of no such thing: "The chief priest (*arkhihiereus*) opposed it in a speech which he made in an assembly of the priests, to the effect that Darius had not yet surpassed the deeds of Sesoösis." Darius seems to have taken this quite well and abandoned his plan for the moment. If this popular tradition has any significance at all, it indicates that, in Egypt, Darius attempted to assimilate for his own benefit the prestige

of earlier pharaohs, particularly Sesostris, who was presented by Herodotus and Diodorus as the greatest of conquerors and administrators. Before launching into the conquest of the inhabited world, Sesostris, after "dividing the entire land into thirty-six parts which the Egyptians call nomes, set over each a nomarch, who should superintend the collection of the royal revenues and administer all the affairs of his division." He surrounded himself with men of his generation who were totally devoted to him: "And upon all these commanders he bestowed allotments of the best land in Egypt, in order that, enjoying sufficient income and lacking nothing, they might sedulously practice the art of war." His conquests encompassed an immense space, from the Ganges to the Danube. He conquered Thrace and also the rest of Asia and most of the Cyclades, and in Thrace he erected inscribed columns bearing representations of the conquered peoples. "He dealt gently with all conquered peoples and, after concluding his campaign in nine years, commanded the nations to bring presents each year to Egypt according to their ability (*kata dynamin*)" (Diodorus I.54-55♦). Diodorus again insists on the peacetime accomplishments of this pharaoh; by using the workforce assembled after military campaigns, "in the whole region from Memphis to the sea, he dug many canals all opening into the Nile, in order to facilitate the transport of the fruits and the commercial relations of all the inhabitants; but, more importantly, he safeguarded the country from enemy invasions" (I.56-57). It is quite tempting to see in the portrayal of the exploits of Sesostris implicit references to the achievements of Darius in many domains, in the same way that Diodorus (following Ctesias) dealt with the mythic queen Semiramis in the light of Achaemenid reality.

Similarly, Diodorus situates Darius's codification of Egyptian law within the pharaonic *longue durée*, succeeding the work of prior pharaohs such as Mneves, Sasyches, Sesostris, and Bocchoris (I.94-95):

A sixth man to concern himself with the laws of the Egyptians, it is said, was Darius the father of Xerxes; for he was incensed at the lawlessness which his predecessor, Cambyses, had shown in his treatment of the sanctuaries of Egypt, and aspired to live a life of virtue and of piety towards the gods. Indeed he associated with the priests of Egypt themselves, and took part with them in the study of the theology and of the events recorded in their sacred books (*hierai graphai*); and when he learned from these books about the greatness of soul of the ancient kings and about their goodwill towards their subjects he imitated their manner of life. For this reason he was the object of such great honour that he alone of all the kings was addressed as a god by the Egyptians in his lifetime, while at his death he was accorded equal honours with the ancient kings of Egypt who had ruled in strictest accord with the laws.

In parallel, Herodotus (II.158-59♦) and Diodorus (I.33♦) stress that, by establishing a waterway between Bubastis and the Red Sea, Darius repeated the accomplishment of Necho II, the pharaoh who, according to Herodotus, "began the construction of the canal, . . . a work afterwards completed by Darius the Persian." Herodotus mentions that Necho was forced to interrupt the work because of opposition from the Egyptians; an oracle had proclaimed "that his labour was all for the advantage of the 'barbarian,'" by which it was sometimes understood that it was the foreign merchants who would reap the benefits of the direct link. Diodorus repeats the tradition, but he adds that "Darius left it unfinished," for he had been convinced by his advisers "that if he dug through the neck of land, he would be responsible for the submergence of Egypt" because of the difference in level between the Red Sea and Egyptian territory! This approach allowed Diodorus to credit Ptolemy alone with finishing the earlier projects.

The Pharaoh and the Great King

On the canal stelas, Darius is designated "born of Neith, mistress of Saïs. . . . He whom Râ placed on the throne to finish what he had started." His "mother," Neith, bestowed the bow on him "to repel his enemies every day, as she had done for her son Râ" (Posener no. 8). The pictorial compositions at Hibis (El-Khārga) speak to the ideological objectives of Darius and his counselors in Egypt. Another bit of evidence is interesting. A small wooden *naos* (shrine) was found at Hermopolis bearing inscriptions in the name of "perfect god, lord of the Two Lands, Darius," "the king of Upper and Lower Egypt, Darius," and "Long live the perfect god, lord of the Two Lands, Darius, living eternally." All of these texts and other evidence together lead us to think that Darius wished to signal a continuity with the traditions of pharaonic power.

On the other hand, the ideological discourse is sometimes ambiguous. The two Niles are depicted under the Egyptian winged disk on the Tell el-Maskhuta stela. The gods address Darius in these words: "I give you all the lands, all the subjected countries, all the foreign countries, all the Bows. . . . I give it to you to appear as king of Upper and Lower Egypt. . . ." Darius is "born of Neith, mistress of Saïs; image of Râ; he whom Râ placed on his throne to finish what he had started." The hieroglyphic text, however, repeats the Persian titlature of Darius: "Great King, king of kings," and he is also hailed as "king of kings, son of Hystaspes, the Achaemenid" (Posener no. 8); similarly, on the Susa statue, even Hystaspes is Egyptianized with the attribute "father-of-a-god." The Persian quality of Darius's rule is also expressed by the trilingual (Persian, Elamite, Akkadian) inscription arranged on the left portion of the royal robe of that statue: "This is the stone statue that King Darius ordered to be made in Egypt in order that anyone who sees it in the future will know that the Persian Man ruled Egypt" (*DSab*). This arrogant proclamation of dominion by force of arms leaves no doubt regarding the Persian nature of the new master. It recalls the words that this same Darius had inscribed at Naqš-i Rostam, metonymically addressing an unnamed subject: "Observe the statues that carry the throne. . . . Then you will know that the spear of the Persian warrior has reached far, just as you will know that far from Persia, the Persian warrior has made war" (*DNa*). It is no less striking that, on a statue carved in Egypt by Egyptian craftsmen, the Great King wears Persian ceremonial dress. In fact, in all probability the statue was originally placed in the sanctuary of Atum in Heliopolis. The goal could only have been to impress the Egyptians with an unambiguous representation of Persian power.

The digging of the canal at Suez is generally set in the context of the mission Darius entrusted to one of his squadrons. We are informed about this by Herodotus (IV.44♦), who doubtless received his information from his Carian compatriot, Scylax of Carianda, who took part in the expedition:

The greater part of Asia was discovered by Darius. He wanted to find out where the Indus joins the sea—the Indus is the only river other than the Nile where crocodiles are found—and for this purpose sent off on an expedition down the river a number of men whose word he could trust. Led by a Caryandian named Scylax, the expedition sailed from Caspatyrus in the district of Pactyica, following the course of the river eastward until it reached the sea; then, turning westward, the ships followed the coast, and after a voyage of some thirty months reached the place from which the king of Egypt had sent out the Phoenicians, whom I have already mentioned, to circumnavigate Libya. After this voyage was completed, Darius subdued the Indians and made regular use of the southern ocean. In this way all

Asia, with the exception of the easterly part, has been proved to be surrounded by sea, and so to have a general geographical resemblance to Libya.

This passage in Herodotus is inserted, obviously, in a more general discussion of the limits of the known world and the configuration of each of the major geographical entities (IV.36–46), and this discussion itself is included within a vast panorama of Darius's European conquests. As best we can tell, the mission entrusted to his squadron consisted of reconnoitering the Indus preparatory to the conquest of the country (around 518?). Herodotus sets up a direct connection with a decree issued by Pharaoh Necho after the cessation of work on the canal: Necho ordered some Phoenicians to circumnavigate Africa via the Austral Sea (Indian Ocean), returning via the Pillars of Hercules (Gibraltar), a voyage that they were to complete in three years (IV.43). According to Scylax's tale, the fleet sent by Darius would have circled the Arabian Peninsula before reentering the Red Sea. But, whatever the reality of this circumnavigation may have been, it is too much to imagine that at the same time the king would have ordered the digging of the canal in order to establish a regular shipping line between Egypt and the Persian Gulf. If it ever took place, the sending of boats filled with tribute certainly was an unusual event. Darius's order, affixed to the stela of Shaluf (Posener, no. 9), is more closely related to the sort of thing we see in the royal inscriptions: it represents a symbolic takeover of the space delimited ideally by the wakes of ships. Furthermore, the inscriptions are accompanied by Egyptian-style depictions of the peoples theoretically subject to the power of the Great King. However, the construction of the canal need not be reduced to a political vision; exploratory campaigns demonstrate that there was significant expansion of trade in the region of Tell el-Maskhuta throughout the fifth century.

From Cambyses to Darius

The Classical authors love to sharply contrast the Egyptian policies of Cambyses (impious) and Darius (respectful of Egyptian religion). The opposition is noted explicitly by Diodorus when he discusses Darius as legislator. Following Cambyses' model, Darius concerned himself with the interment of an Apis in year 4 of his reign (Posener no. 5) as "King of Upper and Lower Egypt, lord of the Double Country, endowed with life [like] Râ [eternally? . . .] . . . Indeed, His Majesty loved [the living Apis] more than any king." Although the chronological context raises some problems, we may recall what Polyaeus wrote in this regard (VII.11.7).

The Egyptians could not tolerate the oppression of the satrap Aryandes, and, for this reason, they rebelled. Darius crossed Arabia Deserta. He arrived at the very moment when the Egyptians were in mourning, for, on that very day, the Apis had ceased to "appear." Darius issued the following order: 100 talents of gold would be given to whoever could restore Apis. Pleasantly surprised by the piety of the king, the Egyptians submitted voluntarily to Darius.

It is interesting to compare this text with the hieroglyphic inscription just mentioned, whose text is as follows (fig. 45):

Year 4, third month of the season Shemu, day 13, under the Majesty of the king of Upper and Lower Egypt Darius, endowed with life like Râ eternally (?) . . . , this god was led in peace toward the beautiful West and laid to rest in the necropolis, in his place which is the place his Majesty had prepared for him—nothing like this had ever been done before—after all the ceremonies had been performed for him in the embalming chamber. Indeed, His Majesty glorified him as Horus had done for his father Osiris. They made him a great sarcophagus

Fig. 45. Stela of the Apis that died in 518.

Diodorus, on the other hand, as we have seen, notes that the priests of the sanctuary of Ptah in Memphis refused to allow Darius to erect his statue alongside Sesostris's. While Diodorus did affirm that Darius abandoned his plan without bitterness, it would be naive to conclude from this that Darius's relations with the priests were unclouded, inasmuch as Diodorus wished to stress Darius's "benevolence" toward Egyptian religion. Furthermore, if the anecdote is based on a specific event, it tends instead to prove that the priests were far from reconciled to allowing a foreign king, even a pharaohized one, to impose any decision on them. The contrast between Cambyses and Darius is only relative, in view of the reevaluation of Cambyses' policies already presented (chaps. 1/8–9; 2). They both wanted to be considered in Egypt simultaneously as Great Kings and as legitimate sovereigns.

We can no longer state with certainty that Darius suppressed Cambyses' measures regarding Egyptian temple revenues, even though the contrast between the two kings is implicit in the viewpoint found in the text on the back of the Demotic Chronicle. Of course, in the temple of Hibis at El-Khārga, Darius is shown several times offering fields

of solid, costly material, as had been done previously; they dressed him in garments, they sent his amulets and all his ornaments of gold and every superb precious substance, they were more beautiful than had been made before. Indeed, His Majesty loved the living Apis more than any king. . . . May Darius be able to be for the Apis a recipient of life and prosperity forever (?). (Posener no. 5)

A more recently discovered inscription shows additionally that, in year 33 of Darius, there was a solemn procession for the interment of the mother of an Apis.

This comparison of Polyaeus and the Apis stela raises chronological questions that are still disputed. Furthermore, given that the Polyaeus passage reports the opposition shown by some Egyptians to the policy of Darius's satrap, we must inquire into the exact reasons for this unpopularity. What is principally found in the passage is the traditional picture, setting the good king in opposition to the evil satrap. We tend to doubt that Darius could have suppressed what is presented as an uprising (*apostasis*) with such ease.

and lands to various Egyptian gods. But these are atemporal representations of the pharaoh, which do not necessarily imply actual donations, though they do not exclude them. In regard to the temples, Darius found himself with the same problem as Cambyses: he wanted to attract the temples' support without conceding too much power to them, which would be counter to the interests of the royal authority. Moreover, a Demotic document from 486 seems to indicate that titularies of benefices in the sanctuary of Khnūm at Elephantine were obliged to make payments into the account of the commander, Parnu (in this case for myrrh; *Berlin P.* 13582).

Persians and Egyptians

Contacts between conquered peoples and the central authority were not established via an administration in the abstract. The imperial administration was represented locally, not by satraps alone, but by an entire bureaucratic staff. At least as early as the time of Cyrus and Cambyses, Persians were sent by the king into every one of his provinces. All high-ranking administrators of the Egyptian satrapy were Persian, be they satraps, governors, or garrison commanders of Syene-Elephantine, governors of Coptos, or even military officers sent against Barca in Libya in 513. But at the same time, the Persians had Egyptians in their service, for reasons already suggested. For instance, one of the high officials of the tribute administration, the *sentī*, was Egyptian; we also know of an Osorwēr, one of Parnu's subordinates, at Syene. And the Peteisis Romance only gives names of Egyptians at the governor's court in Memphis (*P. Rylands IX*).

As in Cambyses' day, Egyptians accepted work in the service of the pharaohized conqueror without apparent difficulty. In addition to Udjahorresnet himself, we can mention Khnemibre, who in a series of more than a dozen inscriptions gives valuable information on his origins and duties (Posener nos. 11–23). These inscriptions were carved in the rock in Wadi Hammamāt, a place that, traditionally, the pharaohs used as a source for stone for statues and buildings. This is also the source from which the block was quarried that was eventually carved into the statue of Darius discovered at Susa. In Egypt, Khnemibre held the title "head of labor of Southern and Northern Egypt," at least as early as the last year of Pharaoh Amasis. In a fictional genealogy, he claims family links with predecessors in the New Kingdom and the Ethiopian period. Some of his inscriptions date to years 26 (496), 27 (495), 28 (494), and 30 (492) of Darius. Some are dedications to the gods Min, Horus, and Isis of Coptos. He gives himself grandiose titles such as "commander of the soldiers, commander of the work of the troops." It is possible that this title refers to the military organization of expeditions for quarrying stone. It is equally likely that the title does not correspond to the exact powers bestowed on him. We also have a series of texts inscribed in the name of a Persian, Atiyawahy, "son of Artanes and the lady Qanju," whose activity in Wadi Hammamāt spans 51 years, from Cambyses 6 (524) to Xerxes 13 (473). He hails Darius as follows: "The good god, lord of the Double Country, Darius, endowed with life like Râ, beloved of Min the Great, who dwells at Coptos" (Posener no. 24). It is likely that his job was to supply stone to the construction yard at El-Khārga. He bears the title "*saris* of Persia": doubtless he was governor of Coptos and the entire region of the Wadi Hammamāt.

Another Egyptian, Ahmose, gives himself prestigious titles: "Honored before the Apis-Osiris, the sole companion, the head of soldiers Ahmose . . .," and he states that he played a very prominent role during the interment of an Apis:

He stood before the Apis, in charge of the archers and directing the troop and the elite soldiers to be sure this god achieved his place in the necropolis. I am a servant active for your *ka*. I spent every night on watch without sleeping, seeking how to do all the things needful for you. I placed respect for you in the hearts of the people and the foreigners of all the foreign countries who were in Egypt by what I did in your embalming chamber. I sent messengers to the South and others to the North to summon all the governors of towns and provinces bearing their gifts to your embalming chamber. . . . (Posener no. 6)

Once more, the traditional terminology must not lead us into error. The primary function of this type of inscription is to preserve the memory of an important person among the Egyptians—to whom the inscriptions are addressed. The words used by Ahmose do not imply that he personally organized all the ceremonies that accompanied the interment of an Apis. The titles themselves say more about his prestigious status in Egyptian society than about his actual place in the political-administrative hierarchy of the country.

On the model of Darius himself, Persians in Egypt could adopt Egyptian customs. It is particularly striking to note that Amasis, whom Herodotus refers to as a member of the illustrious Persian tribe of Maraphii, had an Egyptian name (IV.167). Since Polyaeus calls him Arsames (VII.28.1), we are led to believe that he adopted the Egyptian custom of double naming. We also know of Ariyawrata (brother of Atywahy), who in a later inscription (461) presents himself as follows: “The Persian Ariyawrata, nicknamed Jeho, son of Artames, born of the lady Qanju” (Posener no. 31). Such naming practices doubtless facilitated Persian contact with the Egyptians, but we cannot conclude with certainty that the conquerors were Egyptianized on the basis of the names.

We will make the same cautionary remark regarding certain Persians’ invocations of Egyptian gods. This is the case with Persian administrators who officiated in the Wadi Hammamât: Atywahy, mentioned above, who is attested under Cambyses, Darius, and Xerxes; and his brother Ariyawrata, under Xerxes and Artaxerxes I. The two brothers invoked, or at least referred to, Egyptian gods in this formula:

Min the great, who is on [his] altar
 Year 10 of the Lord of the Double Country Xerxes
 Made by the *saris* of Persia, Atywahy and Ariyawrata

or:

Made by the *saris* of Persia, Atywahy, may he dwell before Min who is on [his] altar.
 (Posener nos. 27–28).

It seems risky to take this as an index of Egyptianization in the strict sense. It was only an imitation of the Great Kings, all of whom adopted an Egyptian titulary. Since the brothers were governors of Coptos, it was logical for them to invoke the god of the city, Min. Votive bulls found in Egypt indicate that some Persians, imitating Cambyses and Darius, also showed respect for Apis.

Conversely, Egyptians tried to assimilate to the dominant socioethnic class. In addition to Udjahorresnet, we may cite the case of Ptah-hotep. His statue bears an inscription with the title of treasurer, but it is difficult on this basis to know the exact position he held in the satrapal administration. On his Egyptian robe, he wears typically Persian jewelry (a torque), doubtless a royal gift. Elsewhere, a seal carved with the name of Pe-teisis, an Egyptian boatman, also testifies to the interweaving of Egyptian and Persian traditions. In particular, we can make out the image of Ahura-Mazda, in the form of a body breaking away from horizontal wings.

Generally speaking, the representatives of the Egyptian elite had few problems becoming supporters of Cambyses and Darius, because the practice of conferring royal gifts was well known among the pharaohs. One of the most interesting documents in this regard is an inscribed statue found in the vicinity of Priene. It appears that the dedicator, a man named Pedon, performed a service for Psammetichus. As a reward, the pharaoh bestowed on him as "prize for his value (*aristeia*), a gold bracelet and a town, by reason of his courage (*aretēs heneka*)." He had his image portrayed in Egyptian style, and the statue itself was certainly made in Egypt. It was in fact typical for a pharaoh to decorate faithful subjects with necklaces or bracelets. The gift of a town is also known from other texts. We are instantly struck by the fact that the manner of distinction and the objects themselves correspond closely to what is known of Achaemenid royal gifts (lands, towns, bracelets, necklaces; see chap. 8/1). The decoration of Ptah-hotep's robe also reflects the encounter between Pharaonic and Achaemenid practices. It is no less noteworthy that a sculptor portrayed the jewelry worn by Udjahorresnet in the Egyptian style. In other words, neither Udjahorresnet nor Ptah-hotep would have felt a sense of "betrayal" if they received gifts and honors from the Great King, for from their point of view, it was just another pharaoh who was honoring them in this way. This is precisely the meaning of one of Udjahorresnet's statements: "I was a [man] honored before my masters; [as long as] I lived(?) they gave me gold jewelry and made every useful thing for me" (Posener no. 1F). It is clear here as elsewhere that Udjahorresnet did not distinguish the Saïtes from the Great Kings; in other words, the latter are situated in the *longue durée* of pharaonic history.

The allegiance of the Egyptians to Darius sometimes took more personal forms. One of the most interesting items is a votive stela showing an Egyptian praying before the Horus falcon (fig. 46). The dedicator addresses him as Darius, who was assimilated to the Egyptian god. This was a private monument, which seems to show that, in the popular Egyptian consciousness, Darius was thoroughly and genuinely divinized.

A Brief Evaluation

All in all, the nature of Darius's power in Egypt elicits a mixed evaluation. The desire for pharaonic continuity cannot be denied, but perhaps we should no longer insist on this factor to the exclusion of others, especially because Udjahorresnet so suspiciously insists on it. He must have seen only advantage in thus exalting his loyalty to Cambyses and Darius, both of whom he intentionally situates within Egyptian continuity. The statements of Darius himself are more ambiguous: even while presenting himself as

Fig. 46. Egyptian votive stela.

legitimate sovereign, he never fails to stress that he is the conqueror who does not owe his power simply to the good will of Udjahorresnet and his ilk. The passage from Saite power to Persian dominion was not achieved without upheavals and changes. Together with Cambyses' decree, the disappearance of foundation stelas seems to illustrate Persian repossession of the Egyptian sanctuaries. The suppression of the "Divine Consort" should perhaps be placed in the same context. It was a religious and dynastic institution that obviously no longer suited the new conditions after the conquest and the "appearance" of a pharaoh whose interests encompassed a horizon infinitely vaster than the Nile Valley and its surroundings.

2. *Babylonia under Darius*

Sources

Despite the large number of tablets dated to the reign of Darius I, the history of Babylonia is rather poorly known after Intaphernes (Vidafarnah) regained control of the region in 520 (DB §50). This is because in many cases the mention of Darius's regnal year—"king of Babylon, king of the countries"—is nothing more than an element in the dating formula of documents coming from the private sector. Thus, only rarely and indirectly are we able to detect the presence and actual operation of the Achaemenid administration. In comparison with the previous period, we suffer from the loss (or non-publication) of the temple archives, especially for the Eanna of Uruk. Darius's accession to power coincided with Gimillu's appointment to the *ferme générale*. This dishonest oblate carried out his dubious operations under the usurper Nebuchadnezzar IV, before being dismissed in 520. After this date, the materials are painfully lacking, aside from sporadic documents from 511–510 that mention the name (Murānu) of the king's principal at the Eanna. Given the state of the evidence, no conclusions of a historical nature can be drawn concerning the relationship between the Persian authority and the towns and sanctuaries of Babylonia, although the number of published tablets increases each year.

Satrapas and Governors

The administrative system set up by Cyrus in 535 survived the troubles of 522–520. The "governor of Babylonia and Ebir Nāri [Trans-Euphrates]" continued to rule an enormous district extending from the Tigris to the borders of Egypt. It was ruled by an individual whom the Babylonian texts call 'governor' (*piḫatu*) and whom the Greek texts call "satrap": "The government of this region—the satrapy, as the Persians call it—is of all the governments the most considerable," writes Herodotus, for example (I.197; cf. III.161), underlining the considerable profits that the satrap could draw from the region. There are tablets attesting that, between 521 and 516, Uštānu held the post. He disappeared at an undetermined date; a text shows that in October 486, a few weeks before the death of Darius, the government was secured by Ḫuta[. . .], son of Pagakanna. The territory of Babylonia proper was itself subdivided, testimony to persistent continuities. We know for example of the existence of the "country of the Sea" (*Māt Tāmtim*) in the marsh region of the Lower Tigris. The great towns were still administered by local governors, the *šakin tēmi*, Babylonians who must have come from the class of *mār hanē*, the citizen-landowners with full rights in the Babylonian cities. In the time of Darius I, they are known at Ur, Borsippa, and Babylon.

At the same time, these local governors appear to have been more and more fully integrated into the satrapal administration. First of all, after 521, the *šandabakku* disappeared, though until this date the position had represented the highest territorial office in Babylonia. It appears that after Darius came to power, he replaced many of the Babylonian holders of high office. Babylon remained one of the capitals of the Empire where the king and court were periodically in residence. A tablet from 496 refers to the new palace. This royal presence was also symbolized by the erection of a replica of the monument and inscription of Behistun in the capital of Babylonia. The growing integration of the country into the imperial administration is also marked by the increasing number of Persian names, particularly in the areas of finance and justice. It is interesting to note that one of the governors of Babylon, Iddin-Nergal, had the Persian title **vardana-pāti* 'chief of the town'. A series of tablets also mentions a certain Bagasarū, who held the post of treasurer in Babylon between 518 and 501. His title is given in its Babylonian form, *rab kāšir*, then in its Iranian form, **ganzabara*, in tablets from 511 to 501. Bagasarū was one of the Persians who held land in Babylonia, doubtless company land. His house was run by a majordomo (*rab bitī*) called Piššiya, who had a large staff under him. Several tablets show that Bagasarū did not work his lands directly: he had them managed by representatives of the Egibi business concern, who returned part of the harvests (or their value) to him as farm rent. That is, beginning with Darius I, a system was in place for managing lands and revenues. Documentation from the house of Murašū during the reigns of Artaxerxes I and Darius II allows us to analyze this system more precisely. It was a system that implied close cooperation between the aristocracy and the Persian power and the representatives of Babylonian business firms. On this topic, one of the representatives of the Egibi family, Marduk-našir-apli, who bore the nickname Širku, also acted as the administration's intermediary: for example, he levied taxes on land held in Babylonia. He also collected certain royal taxes, as is concretely shown in a tablet (TCL 13.196):

[Concerning] the collection of tolls on the bridge and the quai [for boats] going downstream and upstream, prerogative of Guzānu, the governor of Babylon, which is at the disposal of Širku, for the half of the part that returns to him of the revenue on the bridge of Guzānu, the governor of Babylon, which he shares with Murānu, son of Nabū-mukin-apli, Nabū-bullissu, son of Guzānu, as well as Harišānu and Iqūpu [and] Nergal-ibni, the guardians of the bridge. Širku, son of Iddinaia, descendant of Egibi, and Murānu, son of Mabū-mukin-apli, descendant of . . . ? . . . in farm rent for 15 shekels of white silver of 1/8 alloy, of current quality, have given [this collection] to Bēl-asūa, son of Nergal-uballit, descendant of Mudammīq-Adad and to Ubaru, son of Bēl-ahhē-eriba, descendant of . . . ? . . . Bēl-asūa and Ubaru will tax the boats that dock at the bridge. Bēl-asūa and Ubaru will not transfer the silver from the monthly revenue from the bridge belonging to Širku and Murānu, owners of part of this [revenue], without Širku's agreement. Bēl-asūa and Ubaru will show Širku and the [other] guardians of the bridge every written instruction concerning this bridge. (after F. Joannès)

The document sheds light on the river tolls in Babylonia, the concession of revenues to elevated persons, and the way certain taxes were collected.

Estates and ḥaṭru

We have several tablets showing that during the time of Darius the same system of military lots that had been set up in the time of Cyrus and Cambyses existed; the system was newly extended beginning at the end of the 520s. Each "estate" was burdened with

Fig. 47. Some Babylonian seal impressions, from Cyrus to Xerxes.

which meant that they had to escort them, or maybe even haul them, in the guise of *urašū* service. This was a requisition for manual labor, which in Darius's time was an element of *ilku*.

In the later documents (Artaxerxes I and Darius II), the enumeration of charges assessed on military allotments was regularly recorded in the following way: "Full taxes, the king's soldier, the king's flour, the king's *bārra*, and all kinds of contributions/gifts (*nadānu*) for the king's house." There is every reason to believe it was the same under Darius I. The terms used indicate that the assessment involved taxes in kind. But several documents reveal that, beginning with the reign of Darius I, some property owners paid in silver equivalents. This is how the role of the Egibi was established. They also managed working land, such as the military allotments. Thus, Širku (that is, Marduk-našir-apli) collected the tax on lots around Babylon between 497 and 495. It was also the Egibi who worked the estates of "the house of the royal son" (*bitu ša mār šarri*). This activity was quite lucrative, judging by the shares drawn by Bagasarū and the Egibis from the orchards between 518 and 500: one-third for the former, and he was the landowner; two-thirds for the latter, and they were the managers!

Persians and Babylonians

For Babylonia, the onomastic information that has been gathered to date allows us to state that the number of Persians and Iranians increased between 521 and 483 but that it remained relatively modest, nonetheless, in view of the considerable number not only of Babylonians but also of representatives of various countries. As for the processes of Iranian-Babylonian acculturation, they are especially evident in later documentation (tablets and seals of the house of Murašū). Nonetheless, they are also detectable in the earlier period, even though the scenes on seals remain predominantly Babylonian (fig. 47). From the beginning of the fifth century on, we observe the practice of intermarriage and the consequent adoption of Iranian names by Babylonians and vice versa.

a series of fees that, taken together, were called *ilku*. In principle, each military lot allowed the administration to draft soldiers who are described in the same way as their "estates"; for example, horsemen were drafted from a horse estate. Several documents from Darius's reign show that the Babylonian soldiers could be subject to exceptional mobilizations, such as to serve in Elam. In every case, they had to equip themselves according to the standards set by the administration, bearing their own associated costs, which could be quite high. The soldiers could be requisitioned "at the head of ships,"

To be sure, Persian–Babylonian contacts are old. The importance of Babylonia in the Empire and the frequent presence of the court in Babylon could only have encouraged contacts and mutual influence.

3. *Trans-Euphrates*

The District of Trans-Euphrates

Within the immense district whose central seat was at Babylon, Trans-Euphrates was ruled by a governor who was both a private individual and a subordinate governmental official. At the beginning of Darius's reign, the book of Ezra mentions "Tattenai, satrap of Transeuphrates [Ebir Nāri], Shethar-bozenai [Satibarzanes] and their [Persian] colleagues" (5:3♦). In tablets dated 502, he also has the title 'governor' (*piḥatu*) of Ebir Nāri. It is likely that his residence was in Damascus, on which our information is both paltry and late. We know that Damascus was an important stage on the road between Babylonia and Egypt. The form sent by Aršāma with Neḥtiḥōr mentions the presence of two stewards there (DAE 67 [AD 6]); this might explain (if not confirm) Josephus's statement (*Ant.* XI.2.2) that Cambyses died in Damascus during his return from Egypt. We also know that at the time of Darius III, the town was governed by a "prefect" (Quintus Curtius III.3.2). Finally, Strabo describes it as "the most famous of the cities in that part of the world in the time of the Persian empire" (XVI.2.20♦). It is evident from a passage in Berossus (*FGrH* 680 F11) that the town was important in the imperial regime at the time of Artaxerxes II.

Despite the similarity between the (generic) titles for governor, *piḥatu* and *peḥā*, Tattenai did not rule a completely distinct satrapy, but there is no document to clarify the nature of his relationship with the governor of Babylon and Ebir Nāri. Darius's reply to Tattenai nonetheless refers to the "royal revenue—that is, from the tribute of Transeuphrates [Ebir Nāri]" (Ezra 6:8♦), which shows that the management of tribute was organized by subregions. Ebir Nāri, we know, corresponds fairly precisely to Herodotus's Fifth Nome—from Posideium (Ras-el Bassit) to the borders of Egypt (III.91). Even within these large regions, peoples and territories were in turn divided into *medinahs*—a term conveniently rendered 'provinces'. The redactor of the book of Esther (1:1) refers to the 127 provinces of the Empire of Ahasuerus. The term is also found in the letter from Aršāma to the stewards ordered to deliver rations to Neḥtiḥōr and his servants, who were returning to Egypt: "Give them these rations, from steward to steward, following the route that goes from province to province (*medinah*), until Neḥtiḥōr arrives in Egypt" (DAE 67 [AD 6]); it is a pity that the document says nothing of the stages dotting the journey from Damascus to the Nile Valley.

The Province of Judah

There is no doubt that, beginning with the time of Cyrus or Cambyses, the land of Judah by itself constituted a *medinah*. But until Nehemiah's arrival in the time of Artaxerxes I (chap. 14/5), we have no specific information on its organization. Nehemiah himself refers to it as follows: "The former governors, my predecessors, had been a burden on the people, from whom they took forty silver shekels each day as their subsistence allowance"; in contrast, he says that he himself "never ate governor's bread" (Neh 5:15–18). There is no doubt that the Jewish community was subject to paying tribute to the kings, as well as various taxes, such as "the satrap's table." But who were the former

governors? The theory that makes Judah a dependency of Samaria at this date seems to have little foundation. A series of seal impressions and bullas has been found in Judah on which explicit references to the province of Judah (Yehūd) and a governor (*pehā*) can be read. On the basis of this evidence, a list of the governors of the province between Zerubbabel and Nehemiah has been reconstructed: Elnathan (perhaps Zerubbabel's successor), Yeho-ezer (early fifth century), Ahzai (early fifth century)—all of them Jews (as were Zerubbabel and Nehemiah). Numerous seals attest to Persian presence, but they are probably later (second half of the fifth century and the fourth century).

The province of Judah and its governor came under the authority of the governor of Ebir Nāri. At the beginning of Darius's reign, Governor Tattenai, accompanied by his chancellery and court, made a tour of inspection of Jerusalem. They found the Jews busy rebuilding the temple of Yahweh. Questioned by Tattenai, the Elders justified the labor by referring to an old decree from Cyrus. Unconvinced, the governor sent a letter to Darius asking him to search "in the king's [royal archives] in Babylon" (Ezra 5:17♦). It was actually in the citadel of Ecbatana that evidence of the document was found. As a result, the Great King ordered Tattenai to let the Jews complete the construction work. Here is the order from Darius, as it is transmitted by the redactors of Ezra (6:6–12♦):

Wherefore, Tattenai, satrap of Trans-Euphrates, Shethar-bozenai and you, their colleagues, the officials of Trans-Euphrates, withdraw from there; leave the high commissioner of Judah and the elders of the Jews to work on this Temple of God; they are to rebuild this Temple of God on its ancient site. This, I decree, is how you must assist the elders of the Jews in the reconstruction of the Temple of God: the expenses of these people are to be paid, promptly and without fail, from the royal revenue—that is, from the tribute of Trans-Euphrates. What they need for [sacrifices] to the God of heaven: young bulls, rams and lambs, as also wheat, salt, wine and oil, is to be supplied to them daily, without fail, as required by the priests of Jerusalem, so that they may offer acceptable sacrifices to the God of heaven and pray for the lives of the king and his sons. I also decree this: If anyone disobeys this edict, a beam is to be torn from his house, he is to be pilloried upright on it and his house is to be made into a dung heap for this crime. May the God who causes his name to live there overthrow any king or people who dares to defy this and destroy the Temple of God in Jerusalem! I, Darius, have issued this decree. Let it be obeyed to the letter!

Darius thus repeated the measures ordered by Cyrus, providing new donations, since the expenses were charged to the tributes collected by the government of Trans-Euphrates. In return, the priests of Jerusalem were to invoke the protection of their god on Darius and his sons. The work was completed in March 515, and the Jews were able to celebrate Passover right away. The Jerusalem community thus continued to enjoy internal autonomy, as had been the case since Cyrus, while at the same time it had to exhibit its submission to Achaemenid authority (in particular in the area of tribute).

Cyprus

We are considerably less well informed about other subregions, such as Cyprus and Phoenicia, which were also subordinate to the government of Trans-Euphrates. Both had to pay tribute (Herodotus III.91) and furnish naval contingents. Both were divided into numerous city-states. Herodotus (VII.98) selectively names the rulers he considers the most important: two Cypriot kings (Gorgus and Timonax) and three Phoenician kings (Tetramnestus of Sidon, Matten of Tyre, and Merbalus of Aradus).

It is clear that Cyprus, because of its close relations with Cilicia (see below), always represented a strategic location that was essential to Persian Mediterranean policy; thus,

we can extend to the entire period the reflections that Diodorus assigned to Artaxerxes II in the 380s: "The king understood the advantageous position of Cyprus, being able to furnish a considerable fleet and serve as an outpost in the Asian war" (XVI.42.4). The island also had old ties to Phoenicia. There was a town there called "Carthage of Tyre" (Amathonte or Kition), and the evidence of Phoenician influence in it is considerable, alongside Greek influences and ancient Eteo-Cypriot roots. Moreover, many dynasties were of Phoenician origin and continued to use the Phoenician language in their inscriptions.

We learn a little more about Cyprus at the time of the Ionian revolt. Onesilus, brother of Gorgus, king of Salamis, seized power and persuaded the Cypriot cities, except Amathus, to join the revolt (Herodotus V.104). At this point, Herodotus gives the genealogy of the king of Salamis—a kingdom that appears to have been the most important on the island. The king of Salamis, Gorgus, and his brother Onesilus were sons of Chersis, grandsons of Siromus, great-grandsons of Euclthon (V.104). Power thus passed from father to son. But on at least one occasion we see that the Great King intervened in these internal affairs. According to Herodotus, the Persian victors had the Salamisians return power to Gorgus (V.115). Since Gorgus had fled to the Persians (VII.104), he must have recovered his throne due to the direct support of Darius. At the end of the revolt, Herodotus writes simply, "after a year of freedom Cyprus was once more brought into subjection" (V.116♦). But Herodotus's vocabulary tells us nothing of the status of the Phoenician cities. We know that Persian garrisons were stationed on the island, but it is likely that they were already present before. We are prompted (without proof) to repeat the judgment formulated by Diodorus on the position of the Cypriot kings in the fourth century: "In this island were nine populous cities, and under them were ranged the small towns which were suburbs of the nine cities. Each of these cities had a king who governed the city and was subject to the King of the Persians" (XVI.42.4♦). At the same time, the expedition led by Artaxerxes II demonstrates that the Great King could not allow a Cypriot king to formally declare his independence and stop paying tribute (cf. Diodorus XV.9.2).

Phoenicia

Like the Cypriot city-states and Syria-Palestine, the Phoenician city-states are included in the Fifth Nome of Herodotus (III.91). Their prime appearances in the sources are to furnish large, renowned naval contingents, from Cambyses' conquest of Egypt to Xerxes' expedition (525–479). According to Herodotus (VII.89), the Phoenicians, grouped with "the Syrians of Palestine," provided Xerxes with the biggest contingent (300 ships). "Next to the [Persian] commanders the following were the best known of those who sailed with the fleet:" the kings of Sidon, Tyre, and Arad (VII.98♦), and he states that "the fastest ships were the Phoenician—and of these the Sidonian were the best" (VII.96♦): the only comparable ships were those of Artemisia of Halicarnassus, which "were the most famous in the fleet, after the contingent from Sidon" (VII.99♦). It was the Phoenicians of Sidon who won the rowing match organized near Abydos (VII.44). It was a Sidonian ship from which Xerxes reviewed the navy at Doriscus (VII.100) and which he boarded when the fleet departed (VII.128). The reputation of the Phoenician ships was well founded. A sealing on a Persepolis tablet (PT 8) from the reign of Darius shows a vessel shaped very like the Sidonian vessels known from later Sidonian coins (fig. 50f, p. 606).

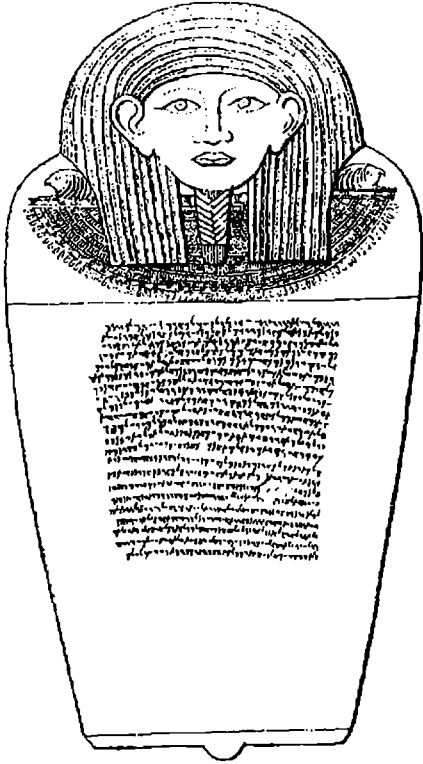

Fig. 48. Inscribed sarcophagus of Ešmunazar.

The most interesting document comes from Sidon: the sarcophagus of King Ešmunazar II, which is of Egyptian origin (fig. 48). The king presents himself as follows:

I, Eshmun'azar, king of Sidon, the son of king Tabnit, king of Sidon, the grandson of king Eshmun'azar, king of Sidon, and my mother, Amo'ashtart, priestess of Astarte, our mistress the queen, the daughter of king Eshmun'azar, king of Sidon. (Rosenthal, ANET 662)

Then, referring to his numerous benefactions in honor of the city, he states:

The Lord of Kings gave us Dor and Joppa, the mighty lands of Dagon, which are in the Plain of Sharon, in accordance with the important deeds which I did. And we added them to the borders of the country, so that they would belong to Sidon forever.

The inscription thus attests to the allocation of lands to Sidon by the Great King. But the date and, therefore, the circumstances of the gift remain in dispute. The Phoenician ships had indeed played an important role from Cambyses down to Xerxes and beyond. Moreover, according to Herodotus (VII.98), in 480 the Sidonian contingent was led by Tetramnestus, son of Anysus. Even if some

linguistic deformation of the personal names has taken place, there is no way to make this into a reference to Ešmunazar, son of Tabnit, who, moreover, died at the age of 14. Since we have no independent gauge for fixing the chronology of the kings of Sidon at the end of the sixth and beginning of the fifth century, the question remains open.

Moreover, Herodotus says the king of Sidon enjoyed a special position under Xerxes. Before the battle of Salamis, he was the first one Xerxes went to for advice among "the rulers of states and commanders of squadrons . . . [they] took their seats according to the degree of privilege which the king had assigned them—the lord of Sidon first, the lord of Tyre second, and so on in their order" (VIII.67–68♦). But, contrary to what has sometimes been supposed, the king of Sidon was not the admiral of the Persian fleet, which remained under the control of high-ranking Persians. Herodotus names four of them (including two sons of Darius), and he states that the Phoenician contingents (and others) reported to Prexaspes and Megabazus. If the local chiefs (including Artemisia) were consulted, it was because of their expertise in plying the sea; the privileged place of the king of Sidon was due simply to the well-known maneuverability of the ships he had provided to the Great King. But responsibility for strategy rested solely with the Great King and his associates.

4. From Jerusalem to Magnesia on the Meander

Darius, Gadatas, and the Apollo of Aulai

Between Otanes' conquest of Samos (ca. 520–519) and Darius's stops at Sardis on the way to and from his European expedition, we have not one factual word about Persian policy in Asia Minor. This is why there is so much interest in a document traditionally called the Letter of Darius to Gadatas, which we present and discuss at this point, whatever the doubts surrounding its actual date. It reads:

The king of kings, Darius, son of Hystaspes, to his servant (*doulos*) Gadatas speaks as follows: I understand that you do not obey every point of my instructions. Without doubt you exercise care in cultivating the land that belongs to me, since you transplant into the regions of Lower Asia trees that grow on the other side of the Euphrates: on this point, I praise your intent, and, for that, there will be great recognition in the king's house. But, on the other hand, since you choose to disregard my desires as regards the gods, I shall cause you to experience, if you do not change, my wrath excited by an injury. The sacred gardeners (*phytourgoi hieroi*) of Apollo have been subjected by you to tribute (*phoros*) and required to work profane land (*khōra bebēlos*); that is to disregard the sentiments of my ancestors toward the god who said to the Persians — — — [lacuna] — — —. (ML 12)

The authenticity of the document is no longer really challenged. It might appear surprising to find a Greek version of a royal letter, especially since the inscription is engraved according to standards that date it to the Roman imperial period. It is actually the re-engraving of a document whose original does go back to the reign of Darius, since the characteristics of the epistolary composition are close to the style of the Achaemenid chancellery. At the time of the Roman conquest, the cities and temples had to produce proof of preexisting privileges and immunities that they wished to renew. Of course, the editor-translators Hellenized some words for which they had no equivalent. It is quite likely, for example, that the modifier *doulos*, by which Darius addresses Gadatas, represents Old Persian *bandaka*, which in turn designates the king's Faithful. There is similarly no doubt that the name Gadatas is the imperfect transcription of a Persian name (Bagadāta?). One uncertainty remains: the date within the reign of Darius. We have no benchmark that would allow us to place it either before or after the Ionian revolt (500–492) or before or after Darius's traversal of Asia Minor in 513–512. It is tempting simply to suppose that the royal statement was recorded in a series of measures decided during his stay in Sardis on his return from Europe. Herodotus shows the king sitting on the throne (*proasteion*) of Sardis while receiving delegations (V.12). It is possible that the directors of the sanctuary of Apollo came to him at this time to ask him to take a position on the matter that was troubling them.

The letter itself is in two parts, both distinct and linked. First the king makes known his satisfaction with Gadatas for the horticultural work he has conducted so well. Gadatas's job is not indicated. It has sometimes been supposed that he held the position of satrap of Sardis after the death (undocumented) of Artaphernes around 493–492. It is true that in Magnesia on the Meander there was a residence used by the satrap of Sardis, under Oroetes (Herodotus III.122, 125) around 525 and again by Tissaphernes more than a century later (Thucydides VIII.50.3). According to the *Oeconomicus* of Xenophon, it is also true that the governors' job was to keep the land under cultivation and increase the yield of the soil—otherwise “the garrisons are not maintained and the tribute cannot

be paid" (IV.11♦). Nonetheless, the letter concerns a specific territory, where Gadatas is praised for acclimatizing "exotic" plants from *peran tēs Euphratou* ('across the Euphrates', or Trans-Euphrates)—a Greek phrase rendering (in its way) the Akkadian word Ebir-Nāri. It is difficult not to see this as a reference to the famous Persian paradises that included, among other components, a botanical garden dedicated to experiments with rare species. Given these circumstances, Gadatas was most likely the steward of the royal/satrapal paradise close to Magnesia on the Meander—comparable to "Asaph, keeper of the king's park" (*pardes lammelek*) in Syria, in the time of Artaxerxes I (Neh 2:8♦). The grounds of this paradise are what Darius refers to in the second part as "profane land," corresponding to another phrase at the beginning of the text, "the land that belongs to me" (chap. 10/7). The curious expression "profane land" is justified by the fact that obviously it adjoins the territory belonging to a Greek sanctuary, the sanctuary of Apollo. This is the Apollo of Aulai, near Magnesia on the Meander. Darius scolds Gadatas for commandeering "sacred gardeners," whose privileges can now be reconstructed: the sanctuary enjoyed fiscal immunity, because the "sacred gardeners" did not pay tribute and were not subject to satrapal requisitions under the *corvée* system.

Darius, Tattenai, and Gadatas

Darius's letters to Tattenai and Gadatas testify first of all to the limits placed on satrapal whim. When the king granted privileges to a community, royal letters were sent to the local representatives of the administration. When, some time later, Nehemiah was sent to Jerusalem by Artaxerxes I, he bore letters for the governors of Trans-Euphrates; he also had a letter addressed to Asaph, steward of the royal paradise (who had to furnish wood for construction; Neh 2:7–8). The royal and/or satrapal officers had to conduct an inquiry before making any decision whatsoever. Tattenai did not neglect to do so; he came to question the Elders of Jerusalem, asking them who had authorized the work of rebuilding the temple. Apparently neither the Jews nor the provincial government offices had a written copy of Cyrus's order, and thus Tattenai sent a letter to Darius to ask him to have a search made in the central archives. In the case of Darius's letter to Gadatas, the recognized privileges of the sanctuary of Apollo of Aulai were very old, since Darius attributed them to his "ancestors." It is possible that during the conquest of Asia Minor Cyrus had established good relations with the priests, and they in return had received fiscal immunity. Darius's letter was thus probably sent to Gadatas after the sanctuary administrators had appealed to the Great King to reverse the decision of the steward of the paradise. The royal letter thus was the confirmation of recognized privileges, which Gadatas could no longer ignore under pain of extremely severe sanctions, however laudable his efforts in the horticultural realm may otherwise have been.

The royal missives also show the continuity of the policy of the Great Kings from Cyrus to Darius, which we have every reason to believe held for relations with the Babylonian temples as well. The Gadatas letter provides a rare, explicit example of fiscal immunity bestowed on a sanctuary. The only comparable example is the immunity later granted to the personnel of the temple in Jerusalem: "It is forbidden to impose tribute, customs or tolls" on them (Ezra 7:24♦: *phoros* in the Septuagint). Darius's letter to Gadatas thereby testifies both to an overall ideological strategy and to the specificity of its local applications. If Cyrus granted the sanctuary at Aulai such a privilege, perhaps it was because it had originally been granted by the Lydian kings. The probably limited extent of the lands associated with the sanctuary meant that the loss to the royal treasury

was small; as for political risk, it was negligible in comparison to the ideological benefits the crown could draw from this privileged alliance with a respected sanctuary located near an Achaemenid administrative residence.

The sacred gardeners (*hieroi phytourgoi*) of the Apollo of Aulai could easily be compared with the thousands of sacred slaves (*hierodouloi*) who worked the lands of the great sanctuaries of Anatolia. Strabo, speaking of the hierodules of Comana in Pontus (XII.3.34), states that the master of the sanctuary had full rights over them, except for the right to sell them (*kyrios plēn tou pipraskein*). It was certainly with reference to such implicit precedents or parallels that Antiochus of Commagene, when he founded the dynastic sanctuary at Nemrud Dag, specified:

It shall not be permitted to anyone—king, dynast, priest, magistrate—to reduce these hierodules to slavery (*katadouleisthai*) . . . whether their children or their descendants, who belong to this class forevermore, nor may they alienate them (*apallotriōsai*) in any way, nor maltreat them (*kakōsai*) to any extent, nor extort corvée from them (*leitourgia*), but the priests and the magistrates shall take charge of them and the kings, the magistrates, and every private individual shall protect them. (OGIS 383, lines 171–85)

The villages where the hierodules lived, which the king granted to the sanctuary as *dōrea* (cf. IGLS VII, no. 4028), were similarly protected. Looting and war certainly figured among the possible causes for enslavement or mistreatment that the king and his administration had in mind (which could endanger the regularity of revenue from the affected villages at the shrines and the sanctuary). We should also recall at this juncture what Strabo wrote about the hierodules of the sanctuary of Zeleia (dedicated to Anaitis): as a result of all sorts of misdeeds, their number had diminished (XII.3.37).

Did every Anatolian sanctuary—some of which were Persianized (e.g., Anaitis)—also enjoy privileges such as those conferred on the Apollo of Aulai? The existing evidence does not provide an answer to this question. We must simply emphasize that the consecration of a few sanctuaries is evident during the Persian period (cf. Plutarch, *Art.* 27.4; Strabo XI.14.16). Another document (also late) may provide a parallel: a Greek inscription from Cappadocia reveals the existence of a sanctuary dedicated to an Iranian goddess, Anaitis Barzochara, to whom hierodules were consecrated. It states that they were to be exempt “from molestations on the part of anyone, with their descendants forever.” Such customs and regulations forcefully recall the facts of Darius’s letter to Gadatas, as well as clarify them. But, unfortunately, nothing can be said about the fiscal status of these Anatolian sanctuaries at the time of Achaemenid rule. The looting that was organized by Datames in some of them and that may well be an illustration of his rebellion against the Great King (Ps.-Arist. [*Oecon.*] II.24a; Polyaeus VII.21.1)—which remains to be proved—does not imply that the sanctuaries were normally exempt from any obligation to the imperial power.

5. Western Asia Minor: Cities, Dynasts, and Empire after the Ionian Revolt

The Measures of Artaphernes and Mardonius (493–492)

The nature of the reconquest carried out at the end of the Ionian revolt (chap. 4/3) also shows that the attention paid to local sanctuaries found its limit in the subjects’ loyalty. The reconquest was pursued bluntly by the Persians, in a pitiless fashion that could not have surprised the Greeks. Herodotus reports that the Persians had let it be known

that those who resisted to the end would suffer exemplary punishment: reduction to slavery, deportation, land confiscation, and demolition of private houses and sanctuaries (VI.9). This was the fate of Miletus:

Most of the men were killed . . . ; the women and children were made slaves, and the temple at Didyma, both shrine and oracle, was plundered and burnt . . . The Persians themselves occupied the land in the immediate neighbourhood of the town, and the rest of the cultivated region which belonged to it, and made over the mountainous parts of the interior to the Carians of Pedasus. . . . In this way Miletus was emptied of its inhabitants. (VI.19–20, 22♦)

The islands of Chios, Lesbos, and Tenedos, then mainland towns, and then the towns of the Hellespont were systematically burned and laid waste (VI.32ff.). In contrast, the Samians, who had deserted at the urging of Aeaces, were favored: "Samos itself was not burnt by the Persians, neither their town nor the temples" (VI.25♦).

At the conclusion of these expeditions of reconquest, in the same year (493), Herodotus states, "Something was done greatly to [Ionia's] advantage":

Artaphernes, governor of Sardis, sent for representatives from all the Ionian states and forced them to bind themselves by oath to settle their differences by arbitration, instead of being continually at one another's throats. In addition to this, he had their territories surveyed, and measured in parasangs (the Persian equivalent of 30 furlongs) and settled the tax which each state was to pay at a figure which has remained unaltered to within living memory. The amount was, moreover, much the same as it had previously been. These measures were conducive to peace. (VI.42–43♦)

Then, after mentioning the appointment and arrival of Mardonius as military commander the following spring (492), Herodotus refers to another measure he took: Mardonius "ejected the irresponsible despots from all the Ionian states and set up democratic institutions in their place" (VI.43♦). Diodorus, giving the impression that these measures were taken by Artaphernes after a conversation (certainly invented) with Hecataeus, alludes to the reconquest in the following words: "Artaphernes . . . restored (*apedōke*) to the cities their laws and laid upon them (*epetaxen*) fixed tributes according to their ability to pay (*kata dynamin*)" (X.25.4♦).

Border Wars and Arbitration

Let us make an initial examination of the decisions explicitly attributed to Artaphernes by Herodotus. It is clear that though he calls these decisions 'conducive to peace' (*eirēnaia*), Herodotus was no apologist for the Persian Artaphernes. He was content to note what for him was evidence that the satrap initiated a noteworthy amelioration of relations between cities. The Halicarnassus native knew very well that border wars were one of the most acute problems of the Greek cities. He went on to give a concrete example of "rape and pillage" by reporting what befell some soldiers from Chios who survived the battle of Lade: trying to return home, "they entered the territory of Ephesus" at the moment when the women were celebrating the Thesmophoria: "Seeing that a company of armed men had crossed their borders, [the Ephesians] at once supposed them to be brigands who were after their women. They therefore hurried to the rescue with every available man, and all the Chians were killed" (VI.16♦).

The dearth of arable land provoked the constant envy of neighboring cities. A Hellenistic inscription (283–282) records this fact especially clearly: King Lysimachus had to intervene to arbitrate a violent quarrel that arose between Samos and Priene over posses-

sion of a district (Batinetis; RC 7). Summoned by the king, the delegations of the two cities pleaded their cause, and the Samian envoys presented a history of their rights going back to the seventh century, in the process producing "stories, testimonies, and other judicial documents" that convinced the king of the legitimacy of the ancestral rights of their city!

It is even more interesting that we have a concrete illustration of the measures imposed by the satrap in a Milesian inscription dating to the beginning of the fourth century, thus a century after Artaphernes. It records a decision made by the king (Artaxerxes II) and Struses, "satrap of Ionia," aimed at definitively settling the many territorial disputes between Miletus and Myus concerning an area in the plain of the Meander. The two cities appealed to the king, who ordered Struses to adjudicate. Initially, the problem was passed by Struses to the Ionian judges (whose names are included in the inscription). Miletus and Myus each sent a delegation instructed to plead its cause with the aid of witnesses and evidence. The judges traveled around the area to mark off the territories, then forwarded their decision (or rather, their proposal) to Struses: "after hearing the Ionian judges, Struses decided (*telos epoiesē*) that this area belonged to Miletus" (Tod no. 113). This document confirms the quality of information that Herodotus received. It testifies admirably to the relationship that the satrap established with the cities. The administration officially recognized their autonomy, inasmuch as Struses did not act on his authority alone but delegated responsibility to a local authority traced back to the old Ionian League (which had never officially disbanded). At the same time, the proceeding makes clear that the power resided at Sardis.

The arbitration forced on the Ionian states by Artaphernes was in full harmony with Achaemenid methods, which aimed less at directly governing the cities than at controlling them. Maintenance of order and stability were the foundations of Artaphernes' policy; he strove to ensure imperial order, which could not be maintained in the middle of on-going frontier disputes. But the autonomy of the cities was in turn kept in check by higher orders, since recourse to arbitration no longer relied on their good will but instead on a policy advocated by the satrap, who kept a close watch over its application. As soon as a judgment was handed down, no city could evade it without risking being considered a rebel. It was up to the satrap to enforce the judgment, if necessary by force of arms.

The Question of Tribute

The interpretation of tribute reorganization poses more complex problems. First, reorganization did not lead to an increase in the amount of tribute. Herodotus's remark, that the amount of tribute remained unaltered, seems perfectly credible, since it is impossible to see how Artaphernes could have dreamed of increasing the fiscal pressure on cities that had just been bled dry by their long rebellion. As Herodotus's formulation implies, the arrangements introduced by the satrap did not concern the increase of tribute but its distribution. Diodorus, logically, indicates that tribute was apportioned according to the ability of each city—that is, in relation to the area and productivity of the territories (*kata dynamin*). As we know, at the core of tribute pressure was agricultural revenue (Ps.-Arist. [Oecon.] II.1.4). This was the reason why the Achaemenid administration surveyed each city's territories; the surveys, logically, used parasangs as the unit of measurement. Overall, the amount of tribute imposed by Darius in 518 *kata ethnē* ('on each nation') was not modified. On the other hand, the portion paid by this or that city might have increased or decreased in proportion to the estimate established by the royal surveyors.

Herodotus was thus not wrong to link two measures that seem so different (forced arbitration and reapportionment of tribute). The stability of intercity relations presupposed that civic territories were clearly defined and that their boundaries were recorded in official documents preserved in the satrapal archives in Sardis (*basilikai graphai*). Every modification was recorded there, including, for example, the confiscations and bestowals determined after the fall of Miletus (Herodotus VI.20). Ever afterward, it was the only document that would provide validation: to commence a border war was tantamount to contesting it. This sort of precaution also guaranteed the regularity of tribute payment—an advantage not only to the royal administration but also to the cities, which on the one hand were taxed more equitably and on the other could file appeals based on a satrapal document. Simultaneously, these measures also did away with some of the systemic dysfunctionality that had doubtless played a role in triggering the revolt.

Democracies and Tyrannies

But it is the third measure (deposing tyrants) that creates the greatest difficulties and raises the deepest questions. Moreover, this was so already in the time of Herodotus, who exercised prudence when he introduced his statement in the following way: “[Otanēs] did something which will come as a great surprise to those Greeks who cannot believe that [he] declared to the seven conspirators that Persia should have a democratic government” (VI.43♦). To tell the truth, in the eyes of the historian, the comparison set up by Herodotus is rather unsettling, so great is the skepticism, ever since antiquity (III.80), about the democratic fervor attributed to Otanēs! Let us also note a discrepancy between Herodotus and Diodorus: if, as we think, Diodorus’s phrase (“restored to the cities their laws”) is the equivalent of the measure Herodotus describes (deposition of tyrants and establishment of democracies), then Diodorus credits Artaphernes as the initiator; for Herodotus, it was Mardonius.

A preliminary remark: It is pointless to suggest, on the model of Herodotus’s audience, that this measure is not believable on account of the political attitude attributed to the Persians. Because the Persians did not entertain any ideological preference regarding their subjects’ form of government, they could at any given moment perfectly well support (or: not oppose) the birth of a democratic regime. The only question is obviously the following: Did they really do so? On this point, the evidence is contradictory, at least on first analysis. To begin with, it is clear that the tyrants driven out by Aristagoras who sought refuge among the Persians recovered their previous status. This fact is certain for Aeaces of Samos, who was reestablished on the island “as a reward for the great and valuable services which he had rendered” to the Persians (VI.25♦). And many other tyrants are known to have had power later in other cities (e.g., Chios, Lampsacus), and several were established later by Xerxes (cf. VIII.85). If the information given by Herodotus is not simply hot air—and the rest of his discussion does lead us to believe that he collected his information carefully—then we must admit that the measure he describes, even if it was limited to Ionia (but what exactly does this name mean?), does not merit the general character he attributes to it. What also seems clear is that the introduction of democratic regimes was not the result of an authoritarian decision by the Persian administration. Rather, it can easily be imagined that the Persians learned a lesson from the revolt. The start of the revolt had overtly demonstrated that tyrannical regimes in many cities had been crippled—a circumstance that Aristagoras had used admirably

(chap. 4/3). To reintroduce tyrants by force in cities that wanted nothing to do with them at any price (cf. VI.5: Miletus) would necessarily have led, in the short or long term, to the reappearance of grave internal difficulties, and this would only have damaged the *Pax Persica* that had only just been restored by Artaphernes. Being the pragmatists that they were, the Persians had sometimes restored particularly loyal tyrants such as Aeaces, who had been able to persuade his citizens to abandon the side of the revolt during the battle of Lade; and sometimes they recognized democratic governments that had taken root in other cities after 499.

Perhaps what Herodotus wanted to say was quite simply that, at the end of the revolt, the Persians had not systematically reimposed the tyrants—nothing more; but this was quite enough in the eyes of a fifth-century Greek! It was apparently the same situation that Diodorus refers to when he speaks of “the restoration of the laws of the cities”—that is, autonomy—in the sense that the Persians did not intervene in the establishment of regimes in the cities that had just been conquered. This sort of attitude came from a “peace-making” policy (in the sense Herodotus intended) fully in harmony with the general activity of Artaphernes, to whom Diodorus attributes the measure, perhaps not wrongly. If, as Herodotus states, the decision was made by Mardonius, this simply indicates that he had been instructed to proclaim a royal policy officially, perhaps responding to a request for clarification made earlier by Artaphernes, who certainly did not make any of his decisions without prior consultation with the central authority. After all, at the end of the Ionian revolt, Darius knew just how much he could trust in the loyalty of tyrants, and he was not unaware that a democratic city was perfectly amenable to paying tribute! But, conversely—need we say it?—there was nothing to stop him from installing tyrants in the future, even in Ionia, if he felt that such a policy would be in his interest.

Autonomy and Military Control

The Greek cities, though autonomous, were no less closely controlled. Although direct evidence is scarce, there is no doubt that Persian garrisons were stationed at several points on the shore. Thus we learn from Herodotus that Sandoces was the governor (*hyparkhos*) of Cyme in Aeolis in 480. In 499 (or a little after), Cyme had joined the revolt; it was rapidly (497?) retaken by the army commanded by Artaphernes and Otanes (V.123). Cyme was one of the naval bases for the royal fleet: before 480, Xerxes ordered the ships to gather at Cyme and Phocaea (Diodorus XI.2.3), and Cyme was where the fleet wintered in 480–479 on returning from Salamis (XI.27.1; Herodotus VIII.130). The presence of a governor in the city limited its autonomy considerably. The Persians could not permit the slightest indiscretion at their fleet’s bases and/or in the shipyards, which were scattered all along the Mediterranean coast.

Imperial Power and Dynastic Powers

But Asia Minor cannot be reduced to its narrow western shore, nor to its civil structures. In the interior of Asia Minor, the Persian conquest and occupation did not signify the annexation and incorporation of all the dynastic territories into the network of the new imperial organization. Our information is unfortunately scanty on the relations between the territories and satrapal power. Obviously, the catalog of Xerxes’ army can be cited, as it is given by Herodotus. In Xerxes’ infantry were a large number of peoples (already given in the list of peoples included in the tributary nomes). Some of them

continued to be ruled by dynasts/kings, a fact that is known from later documents: the Paphlagonians, for instance, mobilized with the Matieni (VII.72); the Mysians and Pisidians are also included (VII.74, 76), as well as the Moschians, the Macrones, and the Mossynoeci (VII.78–79), who the fourth-century Greek texts like to stress enjoyed total independence from the central authority but of whom we know nothing (or next to nothing) during the time of Darius and Xerxes—except in Diodorus (XI.61.4), where the Pisidians are portrayed ca. 466 in the image that they were to retain, as enemies of the king.

Among the naval contingents, Herodotus names the Cypriots (50 ships), Cilicians (100 ships), Pamphylians (30 ships), and Lycians (50 ships) (VII.90–92). Although he declines to give the names of the heads of ethnic contingents in the army (VII.96), Herodotus names the heads of the naval contingents. In addition to the Phoenicians and Cypriots, he lists “Syennesis son of Oromedon, from Cilicia; Cyberniscus son of Sicas, from Lycia; . . . and Histiaeus son of Tymnes, Pigres son of Hysseldomus, and Damasithymas son of Candaules from Caria” (VII.98♦). The rest of the discussion shows that, within these countries, the power in turn was parceled out among small principalities. Herodotus once again fails to name the rulers one by one. Nonetheless, he makes an exception for Artemisia: “She was the daughter of Lygdamis, a Halicarnassian; on her mother’s side she was Cretan. She sailed in command of the men of Halicarnassus, Cos, Nisyros, and Calydna, and furnished five ships of war” (VII.99♦). At the time of the Ionian revolt, we learn of the existence of “Pixodarus, son of Mausolus, a man of Cindya, who had married a daughter of the Cilician king Syennesis” (V.118♦). He was probably an ancestor of Mausolus of Mylasa, who is well known from the beginning of the fourth century. According to Herodotus’s version, it appears that the Carians were not able to unite except under the pressure of external aggression. They had a general gathering “at a place called White Pillars (*Leukai Stēlai*) on the [river] Marsyas” (V.118♦); after the battle against the Persians, the survivors “shut themselves up at Labraunda, in the great grove of sacred plane trees known as the precinct of Zeus Stratius,” where they deliberated about the strategy to take (V.119♦). We also know that Lycia was divided among many dynasties, among which the dynasty of Xanthus was constantly trying to achieve hegemony, at least in western Lycia.

We are very poorly informed about Cilicia. The region seems to have preserved some sort of autonomous government. This is at least suggested by the existence of a local dynast referred to as *syennesis* by the Greek authors. He was doubtless the heir of the “king of the Cilicians,” who Herodotus says mediated between the kings of Lydia and Media around 585 (I.74). The same author calls him “Syennesis, king of the Cilicians” in 499 (V.118). Among the most important people in Xerxes’ fleet, again according to Herodotus, was “the Cilician Syennesis, son of Oromedon” (VII.98)—who, according to Aeschylus (*Pers.* 327), died in the battle of Salamis. We must wait until the end of the fifth century for further evidence. In 401, Cyrus the Younger entered into relations with “Syennesis, king of the Cilicians” (Xenophon, *Anab.* I.2.12, 23; Ctesias §58)—whose wife Epyaxa came to find him at Tyriaeum, at the head of his army (I.2.14–20). Syennesis had a residence (*basileion*) at Tarsus (I.2.23). An agreement was reached with Cyrus: he gave Syennesis gifts of honor, “promising him, further, that his land should not be plundered any more and that they might take back the slaves that had been seized in case they should chance on them anywhere” (I.2.27♦).

One should not be quick to conclude from this that the *syennesis* and Cilicia stood outside the Achaemenid imperial realm or that their integration was merely theoretical or fictitious. First of all, Cilicia is included in Darius's tribute organization, making up the entire Fourth Nome by itself; each year, it paid Darius "500 talents of silver, together with 360 white horses" (III.90♦). Furthermore, the *syennesis* had to furnish soldiers and sailors: with 100 ships, the Cilician contingent equaled the contingent of the Ionians and the contingent of the Hellespontines (Herodotus VII.91, 94–95). Finally, Cilicia was a region of strategic importance for the Persians. From the time of Darius on, it was the region through which all had to pass on the great road linking Babylonia with Asia Minor, as shown by the procedure followed by Mardonius in 492:

[He went] down to the coast in command of a very large force, both military and naval. . . . Reaching Cilicia at the head of his great army, he took ship and continued along the coast in company with the fleet, leaving other officers to conduct the troops to the Hellespont. (VI.42♦)

Throughout Achaemenid history, Cilicia retained its role as crossroads and nerve center between the Mesopotamian lands and Anatolia. This emerges clearly again during the preparation for the expedition of 490:

The new commanders [Datis and Artaphernes] left the court and with a powerful and well-equipped force made for the Aleian plain in Cilicia. Here they halted and were joined by the naval contingent—all the ships and men which the various subject communities had been ordered to supply—including the horse-transporters which Darius had requisitioned from his tributary states the year before. The horses were embarked in the transports, the troops in the ships of war, and they sailed to Ionia. The fleet . . . consisted of six hundred vessels. (VI.95♦)

It was the same in the 460s. Artabazus and Megabyzus were ordered to prepare for war against the Egyptian rebels, and they left the homeland with strong contingents of foot-soldiers and horsemen and established camps in Cilicia and Phoenicia. They organized a fleet, requisitioning boats from the Cilicians, Cypriots, and Phoenicians; they camped in Cilicia for a year, where they could proceed to train the troops before setting out for Egypt via Syria and Phoenicia (Diodorus XI.74.6–75, 77.1).

In his passage on tribute, Herodotus also states that, of the 500 talents due annually from the Cilician nome, "140 were used to maintain the cavalry force which guarded Cilicia" (III.90♦). The occupying troops and the garrisons (including the one posted at the Cilician Gates) were able to resupply amply in this way, as suggested by Xenophon:

[Cyrus] descended to a large and beautiful plain, well-watered and full of trees of all sorts and vines; it produces an abundance of sesame, millet, panic, wheat, and barley, and it is surrounded on every side, from sea to sea, by a lofty and formidable range of mountains. (Anab. I.2.22♦)

This is the Aleian Plain, watered by the Pyramus (cf. Arrian II.5.8–9 and Strabo XIV.5.17).

Control of the island of Cyprus also presupposes that the Persians had a firm hold on the Cilician coast. For example, it was from Cilicia that the Persian troops crossed to rebellious Cyprus in 499 (III.109). We may also cite the later example of the war waged against the large island by Tiribazus and Orontes in the 380s: they "took over the armaments in Phocaea and Cyme, repaired to Cilicia, and passed over to Cyprus, where they prosecuted the war with vigour" (Diodorus XV.2.2♦). Cilicia is where the Persian

generals sought to restock food for their troops fighting on the island; in normal times, the merchants made the round trip between Cyprus and the Cilician coast (XV.3.1–2). From Cyprus it was always by way of the Cilician coast that one regained the great road leading to Babylon (XV.4.2; cf. XIX.79.4–6). Maritime Cilicia was not only a location for the concentration of troops; the Persians also located arsenals (*neōria*) and shipyards there. They were able to acquire quality wood in abundance from the famous Cilician cedar forests. Cilicia was rich in other strategic materials: the Assyro-Babylonian sources in particular show that the Mesopotamian sovereigns found horses in quantity there, as well as well-known iron and silver mines.

For the period considered here, we have no direct information on the possible presence of Persians in Cilicia Trachaea (“mountainous”). The irrefutable epigraphic and archaeological evidence of Achaemenid presence comes from the fourth century at the site of Meydançikkale, which is located on a spur 900 m high in the Cilician Taurus. It would thus be very unwise to transfer the conclusions drawn from this fourth-century evidence back a century or more to the first decades of the fifth century (that is, if the Artaxerxes mentioned in the Aramaic inscription is not really Artaxerxes I, a possibility that paleographic analysis does not exclude). Let us simply note that the site is very old: the name *Kiršu*, used for the site in the Aramaic inscription, is already known from a campaign of Neriglissar (557–556), at which time it was the residence of the local king, Appuašu. It is thus not impossible that the Persians had erected a fortress (*byrt*?) there at a very early date.

The Persians in Asia Minor

While the existence of an imperial diaspora in Asia Minor is undeniable, it is more difficult to specify the individuals, aside from the satraps themselves and a few isolated cases. When the Greek authors refer to them, it is most often in a very general way, such as “the Persians of Sardis” (Herodotus III.128; VI.4; cf. Xenophon, *Hell.* III.4.25). Sometimes the allusions are a bit more specific. When Cimon took Persians prisoner at Sestos, “a little while after, the friends and kinsmen of the prisoners coming from Lydia and Phrygia, redeemed everyone his relations at a high ransom” (Plutarch, *Cimon* 9.6♦). Plutarch also called them “powerful ones of the high country” (*hoi anō dynatoi*). These were the same people with whom Themistocles’ host at Aegae, Nicogenes, maintained regular relations (*Them.* 26.1), and Themistocles also took to the road leading to the Great King in the company of a “Coast-Persian” (*meta tōn katō Persōn tinos*; Thucydides I.137.3).

The best-known example (because it is the most concrete) of Persians settled in the provinces is Asidates, who, right at the beginning of the fourth century, had an “estate” in Mysia, on the plain of the Caicus (Xenophon, *Anab.* VII.8.7–22♦). This was a very rich agricultural estate, peopled with slaves and dependents. The Greeks, unable to take a tower (*tyrsis*) “high and large, and furnished with battlements and a considerable force of warlike defenders,” attacked the fortified enclosure (*pyrgos*), which was surrounded by walls “a thickness of eight earthen bricks.” The fortification was further integrated into the defense system of the satrapy, since its defenders were able to use signal lights (fires) to call for the assistance of troops posted in nearby royal garrisons. Many Persian estates in Asia Minor must have been organized similarly, to go by the description of farms (*epauleis*) and “castles” (*tetrapyrgia*) near Celaenae that, “together with the men and beasts with which they were filled,” could only be taken with siege engines (Plutarch, *Eum.* 8.9♦).

The system is described simply and realistically by Xenophon. A satrap himself was surrounded by a large number of Persians as, for instance, at Sardis (Herodotus VI.3–4). Furthermore, there were Persians who had received lands in the conquered countries (these Persians included nobles attached to the central court) so that a house and its revenues would be available when they had to stay there during a mission (Cyr. VIII.6.4–5). It also included even more Persians who came to settle:

In times past it was their national custom that those who held lands should furnish cavalrymen from their possessions and that these, in case of war, should also take the field. (VIII.8.20♠)

We can see the system in action at the very beginning of the Ionian revolt, when the Ionians attempted a raid on Sardis: "All the Persians stationed west of the Halys, on hearing news of what had occurred, mustered for the defence of the Lydians" (Herodotus V.102♠); here, "Lydians" means "Persians of Sardis." They were under the authority of the satrap (Cyr. VIII.6.10), and apparently they were summoned (with other troops) for annual reviews in "the places of assembly." In this way the Persians of the diaspora were included in the organization of the territorial occupation troops, and they contributed to the defense of the imperial territories—all the more efficiently given that in Asia Minor the Greeks, with some fleeting exceptions (Xenophon, *Hell.* III.4.15), were usually unable to counter the Persian cavalry furnished by the nobles of the provinces on the other side of the Halys.

The example of Nicogenes is one of the rare, explicitly individual evidences of the Persian presence in the high country. This example also proves that coast and high country, although constituting two very different categories in the eyes of the Greeks, were not truly separate from each other. It is even more remarkable that we do not have a single case of a marriage between Persians and Greeks (for example). The only available evidence concerns the presence of Greek concubines in the satrapal court. Aside from the case of Harpagus in Lycia, we can note that personal names may suggest mixed marriages in Caria in the fifth century: Megadates [Persian], son of Aphyasis [Greek]; or Letodorus [Greek], son of another Megadates [Persian].

The basic information relating to the Persian diaspora in western Asia Minor dates from a later period; in fact, as we know, the documentation that gives us some idea of the density of Persian and Iranian settlement in certain favored regions is very late (mostly Roman period). But it is quite difficult to date precisely the settlement of large families in this or that region of Asia Minor, except for the Pharmacids of Hellenistic Phrygia; the major Persian projects at Celaenae in Greater Phrygia may date to the time of Xerxes (see chap. 13/9). Place-names incorporating the name "Darius" also offer some leads in this area. Among other information, the late texts include evidence about the establishment of Persian cults. But undoubtedly this process was set in motion at the time of the initial conquests—especially if we recognize, with Tacitus (III.60), that the sanctuary of Persian Artemis at Hierocaesarea (Hypaipa) goes back to Cyrus. But we have no information on Persian cults during this period in a center like Sardis, for example. The best-known evidence is a stela from the region of Dascylium depicting a Persian sacrifice that corresponds quite well to Herodotus's and Strabo's descriptions. It is unfortunately difficult to date with precision—perhaps the second half of the fifth century. In any case, it is a motif found in several areas of the Achaemenid world (cf. fig. 33a–e, p. 244), particularly on a gold plate from the Oxus treasury and a relief found near Kayseri (chap. 16/6 and fig. 60, p. 712).

One particularly interesting piece of evidence is a stela found in 1981 near Dascylium (Sultaniye Köy). Dated around 500, it constitutes the earliest example of a long series of reliefs called "Greco-Persian." In two stacked registers, it shows a funerary banquet scene and a hunting scene. Below these is an Aramaic inscription composed and inscribed by Ariyābama in honor of Addā. The former is clearly a high-ranking Persian and the latter is one of his colleagues. It seems that Ariyābama laid the remains of Addā in or near the funerary mound that the latter had built for himself when he was alive. This inscription is comparable to another inscription—perhaps fairly contemporary, perhaps much later—in Aramaic, also found near Dascylium: a funerary inscription that evokes the memory of the deceased, Elnap, son of Ašya, and invokes the gods Bēl and Nabū (Gibson II, no. 37).

The main interest of the first stela is the introduction of what may be called the first generation of high-ranking Persian officers residing in the districts of Asia Minor, although we are not able to establish direct relationships with the Persians named (in very limited number) by the Classical sources for the Dascylium region. The two stelas show that non-Iranians were included among the satrap's personnel: Addā is a Semitic name; Elnap may be of Jewish origin (but the reading of the name is uncertain): perhaps this man was part of the Jewish diaspora known to have been in Lydia in the fourth century. If this was the case, the second inscription provides evidence of an apparent religious syncretism. Like some of his compatriots at Elephantine, Elnap (if he really was Jewish) did not hesitate to invoke Babylonian gods. There is no longer any doubt that the satraps of Sardis had many Lydians among their collaborators, such as Myrsus, son of Gyges, who was active between the time of Cambyses (and certainly Cyrus) and the beginning of the Ionian revolt, when he died in an ambush (Herodotus III.122; V.121).

Satrapal Art and Local Artists

The stelas just discussed fall into a category traditionally known as "Greco-Persian" because of the central role attributed to Greek artists. This interpretation needs to be modified, however, just like the interpretation that assigns a crucial place to Greek artists in the royal studios. On the one hand, it is true that the appeal to Greek artists, in Dascylium and elsewhere, is very appropriate. In this frontier region, the contacts between the Persians of the satrapal court and the Greeks of the coast were surely intense, as shown for instance in the case of Nicogenes, discussed above. The Greek market was where the Persians of Sardis went to buy *pallakai* and eunuchs (cf. Herodotus VIII.105; Aelian, *VH* XII.1). No doubt, much other merchandise and many people circulated between the coastal Greeks and "the powerful of the high country" (Plutarch, *Them.* 26.1). It is likely that, from this period on, the Persians themselves began to come for long or short vacations to Greek cities such as Ephesus that had been under Iranian influence after the conquest of Cyrus. The settlement of many Greeks in this area on the initiative of the Great King, particularly in Xerxes' time (chap. 13/9), must have favored the growth of all sorts of interactions in the cultural arena.

Moreover, the subjects depicted on the stelas and seals are typically Persian. The Persians particularly delighted in being shown participating in activities related to banquets and the hunt. Scenes of Persian sacrifices are also found. The Persians were the patrons; the Greeks the craftsmen. The same observation can be made for other regions of the Empire. When Aršāma ordered his sculptor Hinzanāy to make equestrian statues (*DAE*

70 [AD 9]), clearly he must have put considerable constraint on the artist's creativity. This was also true, for example, for the artists and craftsmen working in the provincial workshops attached to the satrapal courts and for those who made vases inscribed with the names of the Great Kings in the workshops of Memphis and elsewhere and sent them to the central court: the pattern is the same as the pattern required in the workshops of Persepolis or Susa. Likewise, the small wood and ivory objects found in Egypt evidence typically Persian themes and borrowed typically Persian forms, as does the goldsmithery. The existence of these satrapal workshops would explain the relative uniformity of Achaemenid-period objects found in many regions. The jewelry and small objects dug up at Manisa and Sardis confirm the existence of workshops in the Lydian capital.

Conceived and organized in imitation of the central court (see chap. 8/5), the satrapal courts were relay stations for Achaemenid court art. The inscribed bullas of Dascylium (some dating to Xerxes) are good evidence. Several display scenes evoking the famous aquatic paradise surrounding the satrapal palace. Others carry images of royalty. A large number, for example, show the image of the Royal Hero (fig. 56b, p. 700) so frequently attested on the seals from Persepolis (and elsewhere). Another has an audience scene (cf. fig. 15, p. 210) comparable not only to scenes from Persepolis but also to a painting that was mounted on the inside of the shield of a Persian soldier depicted on Alexander's sarcophagus (cf. fig. 14). It has been proposed, not implausibly, that the artist worked from sketches that came directly from contact with the art of Persepolis. This suggestion is even more plausible because a nearly identical scene appears on several Persepolis seals (cf. chap. 6/1-3).

Royal Persian Art and Lycian Dynastic Art

At the same time, there is evidence from several monuments at Xanthus in Lycia of the diffusion of Persian themes, particularly on the monument referred to as Building G. In addition to showing a group of youths with fly-whisks, one frieze shows a procession of archers and horsemen (fig. 49a); the pose of the squires (arm above the horses they are leading) is amazingly close to what is seen at Persepolis (fig. 49b-c), so much so that it has been hypothesized that "in risking such an un-Greek gesture, the Lycian sculptor relied on a study of an Oriental original" (P. Bernard).

The influences of Achaemenid court art are also easy to discern on one of the best-known monuments at Xanthus, which, since its discovery, has been known as the Monument of the Harpies. It is a funerary column, mounted on a massive substructure, that may originally have stood more than ten meters tall. It is usually dated between 480 and 470. Each of the four sides displays sculptures in the round. Those on the east side are especially interesting: we see a bearded prince seated on a sculpted throne, who is holding a long scepter in his left hand, with its end on the ground; the right hand lifts a lotus flower toward his face; his feet rest on a low footstool. Two people, clearly servants, are seated behind the throne. In front of the prince kneels(?) a young boy offering a rooster; behind him we can see another young man, standing, leaning on a staff, with a dog nearby. On the north side is a prince with beard and mustache, seated on a throne; he is younger-looking, holds a scepter, and also has his feet on a footstool; facing him, a hoplite holds a fully feathered Corinthian helmet; the relief is surrounded by sirens who are leading children away. The west side shows several women: one is seated on a throne,

Fig. 49. Relief from Building G at Xanthus (top) and two Persepolis reliefs (bottom).

while three come to meet her, and another woman, also seated on a throne, is facing a door, probably the door of the tomb.

We must emphasize, finally, the interesting frescoes found on the wall of a tomb at Karaburun, Lycia, not far from another tomb at Elmali (discussed above, chap. 2/6). The tomb at Elmali dates to about 525; the date of the Karaburun tomb, however, is clearly close to the dates proposed for Building G and the Monument of the Harpies at Xanthus (ca. 480–470). From Elmali to Karaburun the evolution appears quite clear: while the Near Eastern (Assyrian) elements are not lacking at Elmali, the workmanship and iconographic repertoire are basically Greek; at Karaburun, on the other hand, the Persian influences are incontestably more evident. The various paintings show scenes from the life of a local dynast: he is reclining on a banqueting couch, in combat on a horse against a Greek warrior, or traveling seated on a chariot drawn by two horses. In the banqueting scene, he wears a long, colored robe and a diadem; two servants wear Persian clothing, while another waves a fan, and a woman (behind him) bears an alabaster and a purple sash. The Iranian influence appears not only in the costumes and poses but also in the floral and faunal decoration: the dynast wears a lion-headed bracelet and holds a cup decorated with floral motifs in his hand; one of the servants brings a goblet decorated with griffins, while the third one's fan has a ram's head on the tip. The

Monument of the Harpies is similar. There is little doubt that the artist who carved the east side, in particular, was inspired by a Persepolis model, since the similarities between it and the audience reliefs of the Persepolis Treasury that date either to Darius or to Xerxes are obvious.

From Xanthus to Karaburun, then, we have very clear indications of Iranian cultural influence. The local dynasts wanted to have themselves shown in the image of the Great Kings. It is true that the case of Xanthus is a bit special, since it is generally believed that the local dynasty descended from Cyrus's lieutenant Harpagus, who conquered Caria, Caunus, and Xanthus and doubtless the towns near the Xanthus Valley. Iranian influence is notable beginning with the reign of Kprlli (485–440), whose coins bear a motif taken from the Iranian repertoire, a striding lion-griffin.

6. Population Resettlement and Deportation

Deportation of Greeks and Other Peoples

Provincial Persians and local peoples were not the only ones to confront each other. Much more than under the Neo-Assyrian and Neo-Babylonian kings, peoples or groups of peoples moved or were moved from one place to another within the Empire. The Greek authors, naturally, were struck by the many times that inhabitants of Greek cities were deported as the result of a royal command. We know of the pronouncement with which the Persians threatened the Ionians who revolted (493): "their boys will be made eunuchs, their girls carried off to Bactria" (Herodotus VI.9♠); and similarly, the threat of "Nebuchadnezzar," transmitted to the Jews by Holophernes: "I will lead them captive to the ends of the earth" (Judith 2:9♠).

The earliest case on record is the case of the Barcaeans, who after the Persian victory (513) were taken first to Egypt and then to Darius, "who gave them a village in Bactria to live in. They named the village Barca, and it was still inhabited within my own memory" (Herodotus IV.202, 204♠). After the conquest of Miletus (493), "the men in the city who were captured alive were sent as prisoners to Susa; Darius did them no harm, and settled them in Ampe on the Persian Gulf, near the mouth of the Tigris" (VI.20♠). Many Greek authors have also preserved the example of the Eretrians taken prisoner during the expedition of Datis and Artaphernes in 490:

Before their capture, Darius had nursed bitter resentment against the Eretrians, because they had injured him without provocation; now, however, when he saw them brought before him in defeat and knew that they were in his power, his anger vanished. He did them no further harm, but settled them on some land of his, called Ardericca, in Cissia, about twenty-six miles from Susa." (VI.120♠)

Ancient authors mention the presence of Boeotian deportees and also deportees from "Carian villages" near Susa (Diodorus XVII.110.4–5). During what Herodotus calls the Second Ionian Revolt (479), the Branchidae of Miletus took Xerxes' side; in the face of Greek victories, they chose to flee in the wagons of the royal army. Xerxes settled them in Bactria and, according to tradition, they were later severely punished by Alexander (Strabo XI.11.4; Quintus Curtius VII.5.28–35). There is obviously no reason to suppose that the Greeks were the only ones so treated; the ethnic roll-call of the Persepolis tablets is proof (chap. 11/3). Herodotus also lists among the deportees the Paconians, whom Darius had settled in Asia Minor (V.12–14); according to Diodorus Siculus,

Cambyes also deported Egyptian craftsmen (I.46.4), and according to Pliny (VI.29.116), Darius is supposed to have transferred *magi* to Media (but this may be an echo of a suspect tradition concerning the revolt of the Median *magi* and the measures taken against them [the *Magophonia*] by Darius; Herodotus III.79). According to late, highly untrustworthy sources, Jews were also supposed to have been deported during the time of Artaxerxes II (see chap. 15/7).

The Status of Displaced Communities

It is not easy to determine the status of deported populations. We will set aside the texts from Alexander's time, which indicate the presence of Greeks and Lycians in the Persepolis workshops and agricultural establishments (animal husbandry), since it is impossible to date their arrival. Diodorus simply explains that their presence went back to "previous kings of Persia" (XVII.69.2♦; see also chap. 16/12). However, the presence of Greeks in Persia during the time of Darius I is evidenced not only by certain texts and graffiti written in Greek but also by several tablets (cf. PF 2072). One tablet refers to maternity rations provided to Ionian women (PF 1224). Others refer to a person using the ethnicon Yauna as a personal name; this was certainly a Greek, who apparently held jobs in the administration, because he handled grain (PF 1942, 1965) and in 499–498 he was a member of the staff of Parnaka and Ziššawiš.

The older texts illuminate the fact that in every case the Greek deportees were provided with a permanent settlement and the use of land. Their situation was doubtless not fundamentally different from that of any other ethnic community settled in Babylonia under the *ḫaṭru* system. The members of these organizations were not exclusively soldiers, and a wide variety of ethnic groups are known: Iranians, Indians, Saka, and people originally from Anatolia as well. A document from Cambyes' reign suggests that Egyptians settled near Nippur had an autonomous organization ruled by elders and recognized by the Achaemenid administration. The same was true for the Jewish diaspora, some of whom remained active even after the others returned from exile. Many Jews, thoroughly integrated into the commercial and cultural context, actually preferred to stay where they were rather than attempt the risky return to Judah. We may make the same observation for the Babylonians settled in Persia beginning with the reign of Cambyes. It seems quite likely that the deported Greek communities enjoyed a status identical to that of other deported groups, or nearly so—which would explain Herodotus's insistence that Darius "did them no (further) harm" (VI.20, 119♦). In the time of Darius III, the Euboeans of Susiana furnished a contingent for the royal army (Quintus Curtius V.1.2). This must have been a general practice, because the deportees (*anaspastoi*) settled on the islands in the Persian Gulf were integrated into Darius's tribute organization (Herodotus III.93) and sent a contingent to Xerxes' army (VII.80).

The Garrisons of Egypt

The placement of royal garrisons throughout the imperial territories also shows that, like groups allotted land under the *ḫaṭru* system, garrisons comprised a variety of ethnic groups. The best-known case is Syene-Elephantine. The presence of Jews on Elephantine goes back to a period before the Persian conquest, since in a petition that the Jews sent to the governor of Judea in 407, they recalled that, "when Cambyes entered Egypt, he found this sanctuary already built" (DAE 102 [AP 30–31]). Although by the nature of things the Aramaic documents come from privileged Jews, they also show that soldiers

of many ethnicities were present: Persians of course, and also other Iranians, Medes (DAE 46 [BMAP 5]), Caspians (nos. 36, 44–46 [AP 13, BMAP 3–5]) Khwarezmians (nos. 33–34 [AP 6, 8]), not to mention Egyptians (no. 101 [AP 27]), Arameans (nos. 6–9 [AP 29, 35, 43, 7] etc.), and even Babylonians (no. 33 [AP 6]). The company (*dgal*) commanders frequently have Iranian names (nos. 11, 33–36, 38, 41 [AP 45, 6, 8, 9, 13, 15, 28]), but others have Babylonian names, such as Nabûkuddurî (nos. 7, 9, 53 [AP 35, 7, BMAP 12]) or Iddinabû (nos. 39, 48 [AP 20, BMAP 7]). We observe the same ethnic diversity at Memphis, both in the garrison and in the royal workshops. Without doubt, even though the Egyptian case is the best known, it is not unique. In addition to the Babylonian example, we know that there were Egyptians, Assyrians, Hyrcanians, and Bactrians among the garrisons in Asia Minor. The excavations at the cemetery of Deve Hüyük (30-odd km from Carchemish) have shown that most of the soldiers there came from northern Iran.

All of the texts also show evidence of the mixing of populations. The military organization itself (the *dgal*) was not a mask for ethnic unity: each company included soldiers of various origins. Naming practices provide a reference point: for example, the Babylonian Nabûkuddurî had a son called Bagadâta (DAE 32 [AP 5]); Nabûre²i and Mannuki had fathers with Iranian names (no. 37 [AP 14]). The Jews' adoption of Egyptian, Aramean, or Canaanite ritual practices or gods is further evidence of ethnic mixing.

7. Unity and Diversity

Imperial Administration and Multilingualism

Coming on the heels of Cyrus's and Cambyses' efforts, the reorganization and reconstruction carried out by Darius radically accelerated the movement toward administrative unification of the conquered territories. Analysis of income from tribute proves that, beginning with Darius, one may speak of an imperial enterprise in the full sense of the word. However, the unification of administrative practices on an imperial scale does not imply a loss of local traditions, which supposedly melted and alloyed into an Achaemenid *koinê*. The conquest and dominion played out on two levels, which are only apparently contradictory: unification and maintenance of diversity.

The documentation from the reigns of Darius and Xerxes reveals the general spread of Aramaic in the satrapal bureaucracies: in Persepolis itself, Babylonia, Egypt, Sardis, Dascylium, and all the way onto the Iranian Plateau. Nonetheless, the administrative spread of Aramaic did not displace the local languages. Naturally, we are reminded of the command given by Ahasuerus in the book of Esther, "to each province in its own script and to each people in its own language" (3:12♦; cf. Daniel 3:4, 7; 6:26) and of the order given by Darius at Behistun: "Afterwards this inscription I sent off everywhere among the provinces. The people unitedly worked upon it" (§70, OPers♦ and Elamite). The versions found in Babylonian at Babylon and in Aramaic at Elephantine prove that the royal order was efficiently carried out.

It is quite clear that local languages and scripts continued to be used heavily, in private texts as well as in official documents sent out by the central authority—for example, the hieroglyphic texts of Darius and Xerxes. There are many witnesses to this continuity, in Asia Minor, Babylonia, Phoenicia, and even Persepolis: for instance, the Egyptian code of jurisprudence was published in Aramaic and Demotic; among the documents

of daily life, there was the slave in Cambyses' Babylonia on whose wrist was an inscription in Akkadian and Aramaic (*Camb.* 143).

Analysis of the correspondence in 492 between Pharandates, satrap of Egypt, and those in charge of the sanctuary of Khnum at Elephantine illuminates this matter very clearly. It shows concretely that Aramaic could not systematically be used as the exclusive linguistic vector between the administration and the subject peoples. The satrap's letter was written in Aramaic by the Memphis offices, under the direction of a high chancellery official (a non-Egyptian, perhaps a Persian), and then was actually translated phrase by phrase by an Egyptian secretary (Pefu'umeith) familiar with Demotic; he ran into some difficulty in this task, resulting in the translation problems encountered by modern scholars. However, the Elephantine priests' reply was rendered directly in Demotic. In other words, to make themselves understood, the satrapal administration needed recourse to local scribes.

Under these conditions, the translations of official documents were not always done with the legal precision, especially if the target language did not have an equivalent for some Persian word. Thus, the Greek translator of Darius's letter to Gadatas could not find any other word to render *bandaka* than *doulos*, and, semantically, the Greek word is only very distantly related to the Persian word assumed to underlie it (cf. also Xenophon, *Anab.* I.6.6). The translations may have been even more complicated because there often was an Aramaic intermediary between the Persian original and the version in the local language. The bilingual and trilingual inscriptions demonstrate the difficulties of rendering: the best example from this time period is the Behistun inscription in its differing versions and, for a later time, the Xanthus Trilingual.

We know of very few examples of language-learning. Themistocles is the best-known example. He learned Persian when he entered the entourage of Artaxerxes I (*Them.* 28.5; Thucydides I.138.1)—so well, in fact, that, according to Nepos (*Them.* 10.1♦), "It was much easier . . . to speak in the presence of the king than to those who were not born in Persia"! Herodotus mentions Histiaeus of Miletus, who spoke Persian, at least well enough to identify himself to a Persian soldier (VI.29). Of course, he had spent more than ten years at the court of Darius. Nonetheless, the known examples are both anecdotal and isolated. All indications are that the Persian language was not widely spoken. Xenophon, to be sure, relates that in Armenia he addressed a village chieftain through an interpreter speaking Persian (*persisti*: *Anab.* IV.5.10) or Persian-speaking (*persizōn*: IV.5.34). But the evidence should not be overestimated. Xenophon does not in fact state that the *kōmarch* actually spoke Persian. We may just as well suppose that an Armenian could, without much difficulty, comprehend a simple conversation in a language closely related to his own.

Strabo states that the populations of the Iranian Plateau (Aria) spoke the same language (*homoglōssoi*), mentioning also that there were minor dialect variations (*para mikron*; XV.2.8). It is likely that Persian was used by some peoples of the Plateau; this is certain for the Sagartian nomads, who spoke Persian (*phōnē*), according to Herodotus; of course he also says that they were descended from a Persian people (*ethnos persikos*; VII.85), in all their tribal diversity (I.125); they preserved methods of combat, for instance, that did not differ greatly from the royal cavalry. The language and traditions of the other Persian tribes, such as the Mardians of Persis (cf. Aelian I.34) probably also had not changed greatly over the years. Strabo notes that the inhabitants of Drangiana were

also acculturated to the Persians (XV.2.10). The word he uses (*persizontes*) could lead us to think that he is referring to adoption of the Persian language, but the context does not require this interpretation. Herodotus (I.125) mentions the Persian tribes of "laborers" called the Germanii; Strabo calls them Carmanians (XV.2.14♦) and says that they adopted agricultural practices similar to those of the Persians. But Strabo's story also shows the extent to which the Carmanians retained their own customs. In particular, a rite of passage that he describes is very different from the Persians' rite (chap. 8/3): before marrying, a young man had to prove his virility by "cut[ting] off the head of an enemy and [bringing] it to the king; and the king stores the skull in the royal palace"!

Aside from the specific case of the Sagartians, there is nothing to indicate widespread use of the Persian language among the Iranian peoples. This is why, for example, Alexander needed to use an interpreter accustomed to the form of speech (*phōnē*) used by the inhabitants of Maracanda in Sogdiana (Arrian IV.3.7). Furthermore, all of the later documents report the vigor of the Bactrian and Sogdian languages, as well as the maintenance of funerary customs in eastern Iran entirely different from the customs of Persia (such as desiccation of corpses).

The maintenance of multilingualism resulted in the use of interpreters. There were many interpreters in the royal army (e.g., Xenophon, *Anab.* I.2.17; 8.12) as well as at the central court, and not just during the reception of foreign ambassadors. For example, during Themistocles' first audience, he addressed the Great King through an interpreter (*Them.* 28.1). The presence of interpreters at the meetings between Cyrus and Croesus (I.86) and Darius and the Greeks (III.38) is also reported by Herodotus. Obviously, Darius I did not bother to learn Greek, although his distant successor Darius II did (at least according to Quintus Curtius V.11.5). There were some Persians who learned to handle the local languages, such as the Greek-speaking Persian at the banquet at Thebes in 479 in honor of Mardonius (Herodotus IX.16), or Pategyas, in Cyrus the Younger's entourage, who knew enough Greek to give an order to the mercenaries (Xenophon, *Anab.* I.8.1). However, at the end of the fifth century, the satrap Tissaphernes still used an interpreter to communicate with the Greeks (Xenophon, *Anab.* II.3.17).

A Babylonian tablet (Amherst 258) dated (theoretically) to the beginning of the fifth century seems to suggest that knowledge of local languages was not a widespread accomplishment among the Persians. It lists rations issued to a series of people, mostly Persians, clearly high-ranking (among them Uštānu, probably none other than the satrap of Babylonia and Ehir Nāri); these Persians may have been passing through Elam and Babylonia or may have completed a mission there. In any case, the tablet mentions a scribe-interpreter (Libluṭu), a translator (Mardukā) attached to Uštānu's retinue, as well as Artapāti's interpreter (Bēl-ittannu). Apparently, these Persians were unable to communicate directly with those they were governing and had to call on Babylonian interpreters to do so. It is also true that the document can be interpreted differently: perhaps the Persians, though they could utter a few words in Babylonian, had not mastered the language sufficiently to give specific orders; or perhaps they insisted on speaking Persian to maintain their prestige; or perhaps the word used (*šipīru*) for the Persians' associates refers primarily to their secretarial function, which is not necessarily linked to the job of translator-interpreter.

Perhaps it would be a good idea not to assign too much importance to this text. Even though oral communication between the Persians and their subjects was in fact hobbled

by a whole series of obstacles, linguistic and/or political, it must be stressed that the use of Aramaic and the work of secretaries and interpreters allowed them to pass easily over the obstacles in administrative affairs, and even in daily life. When Persians made a commercial deal with Egyptians, the text was written in Aramaic (DAE 109); so too for a contract between an Aramean from El-Hibeh (Teuzoi) and an Egyptian peasant (DAE 1). In other words, the perpetual linguistic diversity did not imperil the political unity of the Empire: written or proclaimed in Greek, Babylonian, Lycian, or Demotic, a royal or satrapal order retained its full *Persian* effective value—just as, despite the use of craftsmen from every land and borrowing from various Near Eastern iconographies, Persepolis art is *Royal Achaemenid* art, in the full sense of the term.

Royal Law and Local Law

Because Darius decreed the “codification” of the Egyptian “laws,” it is sometimes said that he must have intended to issue a common set of judicial precepts, known as the “royal law,” throughout the Empire. This interpretation gives rise to many reservations. The jurisprudence collected by the Egyptian sages does not actually equal a law code, in the usual sense this idea has in the context of Roman law. Moreover, this Egyptian jurisprudence was meaningless outside the Egyptian context; it was useful exclusively to the lawyers and judges of the Nile Valley. The satrapal authorities had to conform to it when they chose to intervene in an Egyptian proceeding (see chap. 14/8).

We also know of the existence of judges in Babylonia (*dātabaru*, *dayyānu*, etc.). But the use of Persian loanwords (*dātabaru*/**dātabara*) does not in itself prove that the royal law functioned in Babylonia. The existence of these officials, whose duties are ill-defined anyway, does not imply that Babylonia was subject to an imperial law code. Whatever their titles, the judges rendered their decisions in accord with local law, as long as the case did not leave the regional system. Moreover, the phrase “according to the king’s law (*datu ša šarri*),” which recurs in several Babylonian tablets, may primarily designate fiscal obligation—that is, obligations closer to rules and regulations than to actual laws. The same terminology lies hidden in the Aramaic papyri from Saqqara (*dtbry*’, *dayyēnē*); in all likelihood, these judges were to preside over civil trials, as in the southern provinces (*dyny*’ in the Aramaic documents from Elephantine). Of course, on rare occasions they appear at Elephantine as ‘royal judges’ (*dyny mlk*’; cf. DAE 2 [AP 1]). But the temptation to equate them with the category of royal judges, as it is known from the Classical sources, must be resisted: royal judges were named by the king and acted only in a Persian context (Herodotus III.31; *hoi patrioi thesmoi*). In Egypt, judges, provincial judges, and royal judges presided over cases and their appeals under the authority of the governor, satrap, and, ultimately, of the king.

The Persian word *dāta*, translated ‘law’, is itself responsible for some of the ambiguities. For example, in a Persepolis tablet, it designates “regulations” that the heads of warehouses had to follow (PF 1980: Elamite *datan*). This is also the framework in which we must understand the tasks entrusted to the judge (**dātabara*) of Parnaka (PF 1272). In the book of Esther, the word *dāta* appears nineteen times to refer to a court regulation (e.g., 1:8: wine reserved for the king *kata prokeimenon nomon*) or to refer to established custom (1:15: judgment of Esther *kata ton nomon*) or to the king’s edict (1:19: *prostagma*). Here the translation of *dāta* by *nomos* is perfectly appropriate. In the Greek authors, in fact, the word *nomos* simply refers to Persian practices (e.g., Ctesias §57:

funerary practice; Herodotus I.131–40, etc.) and/or Achaemenid court practices—as in Aelian, who was fond of these court regulations: I.21 (*nomos epikhōrios: proskynesis*), I.31–32 (*persikos nomos: obligatory gifts from the Persian peasantry to the king*), XII.62 (*nomos persikos: obligations of the king's councilors*). To get to the bottom of these comparisons, including a playful one, let us come back to the Elamite phrase *datam appukana*, which is usually understood as 'according to the usual/traditional regulations' rather than as 'according to the former law' (PF 1980). One can see how a Greek author trying to render it in his own language would have used a formula such as *kata ton (persikon) patrion nomon!*

In a passage with little historical credibility, the redactor of the book of Esther contrasts the laws of the Jews with the laws of the king (3:18: *nomoi tou basileōs*). But here, the accent is on the political rather than the judicial aspect: there was no question of imposing the Persian laws everywhere; instead, the royal edict explicitly recognizes the laws of the various peoples (*nomoi . . . para panta ta ethnē*), in the same way that the royal edicts were published in all of the languages of the Empire, "declaring that every man should be master in his own house" (1:22). One final example, the one most often quoted, is Ezra 7:25–26♦, in which we find the royal order in the following form:

And you, Ezra, by virtue of the wisdom of your God, which is in your possession, you are to appoint scribes and judges (*kritai*) to administer justice for the whole people of Trans-Euphrates, that is, for all who know the Law of your God. You must teach those who do not know it. If anyone does not obey the Law of your God—which is the law of the king—let judgement be strictly executed on him.

There is no trace here of a desire to extend a "code of imperial laws," since the king recognizes and protects the laws of the Jews (the Torah), according to which the judges appointed by Ezra will render their decisions, including regarding Jews living outside the territory of Judah ("all the [Jewish] people in the Trans-Euphrates province"). The explanation is quite different: as soon as they are recognized by the Great King, local customs are included in the general category of "royal law." In other words, they acquire ipso facto (and first of all with respect to the satrapal administration, to which the king speaks) an authority that does not proceed exclusively from the local people's own traditions. In a way, from the perspective of the rulers of local communities (*ethnos*, city, sanctuary), the label "royal law," far from being considered a limitation on their autonomy, constituted a sort of royal guarantee against satrapal arbitrariness. In this sense, Darius's tribute reforms can be included in the category of "royal law": while they symbolized and marked submission, they also strictly limited the unfortunate impulses of satrapal authorities.

In sum, we must firmly conclude that there was in the Empire no law code imposed on every population without distinction. In this sense, the concept of royal law belongs in the sphere of politics, not of law. This is how Darius's statement at Behistun must be understood: "By the power of Ahura-Mazda, these peoples respected my law (*dāta*), they did as I ordered" (§8). Here, *dāta* is nothing more than the requirement of loyalty (*arta*) and the obligation to pay the "king's portion" (= *baji* [*baziš*] 'tribute'). The word obviously reflects politico-religious ideology, not judicial organization; it designates and exalts the unshared domination of the Great King over his countries and his peoples.

PART FOUR

From Xerxes to Darius III:
An Empire in Turmoil

Chapter 13

Xerxes the Great King (486–465)

1. Sources and Problems

The Year 479 and Xerxes' Reputation

Traditionally, modern historiography has presented a terrible image of Xerxes' personality and reign. This image was already fully fashioned in Rawlinson's *Five Great Monarchies*, a work published in 1867: with Xerxes began the disorders of the harem, assassinations, and conspiracies; around him were unleashed the passions of the court princesses and the growing influence of the eunuchs, with the result that "the character of Xerxes sank below that of any of his predecessors." The king was weak, easily influenced, immature in his appetites, egotistical, cruel, superstitious, licentious. All this explains the decline of the Empire, which had become exhausted by the bloodletting of the Second Persian War. This decadence was visible not only in the territorial and military realms but also in the area of administration and "national spirit." "With Xerxes began the corruption of the court," evident in the growth of luxury and the effeminacy of the customs. Rawlinson is willing to concede that the king was able to demonstrate his aptitude as a builder, but at the same time he emphasizes that most of the buildings dated to his reign were probably planned by his father, Darius. We can see that, despite the clearest warnings, this image of Xerxes has continued to be set forth even in recent articles and books. My concern with this presentation of Xerxes can be put in the form of one direct, simple question: What is the significance of the year 479 in Persian history? In answering this question, we must first inquire into the origin of the above point of view, since any reexamination presupposes a historiographic consideration of the way that the viewpoint came into being.

Persian History and Hellenocentrism

It is easy to see that the traditional view is based primarily on an uncritical reading of the Classical sources. Aside from Herodotus's passage on the choice of a crown prince (VII.2–3) and a very brief allusion to Xerxes' reconquest of Egypt (VII.7), all of books VII, VIII, and IX of his *Histories* are dedicated to examining the king's preparation for and the Persian defeats at Salamis (480), Plataea, and Mycale (479). Herodotus's narrative stops suddenly with Xerxes' preparations for leaving Sardis after the defeat at Mycale. What is more, the last chapters of Herodotus have played no small part in establishing the picture of a decadent king. Herodotus relates, in fact, that during the king's stay at Sardis when he returned from the European expedition, he fell in love with his sister-in-law, the wife of his brother Masistes; unable to seduce her, he "arranged a marriage between a daughter of Masistes and this woman and his own son Darius, under the impression that by this means he would be more likely to get her" (IX.108♦). Herodotus then introduces Amestris, Xerxes' wife, and her fateful influence on the spirit of her husband, as well as her untold cruelty (IX.109–12). This adventure touches on the

revolt of Masistes, which led to the massacre that took not only Xerxes' life but also the lives of his children and his forces (IX.113). Injected into the story of the Greek victories in Asia Minor, these tales fostered the image of a king subject to the nefarious influences of the women of the palace and more interested in slaking his guilty passions than in defending the territorial inheritance of Darius. In reality, placing such an emphasis on the story of Xerxes and his sister-in-law results from a highly questionable methodology. On the one hand, the story is a romance, characterized by a whole series of repetitive motifs on which it is extremely imprudent to base any historical extrapolation. On the other hand, Herodotus's tale contains many other informative elements that are much more convincing about the policy and strategy followed by Xerxes after his return from Salamis—at least if the historian chooses to free himself from the overwhelming weight of stereotypes.

Of course, we have already pointed out Herodotus's inadequacies several times. But his disappearance (as historiographer) after 479 also suggests that we need to reevaluate his place in the reconstruction of Achaemenid history. We lose the narrative thread that has guided historians ever since the conquests of Cyrus and Cambyses. And no other Greek author represents a viable alternative. As narrative, Thucydides' famous chapters on the formation of Athenian power (I.89–95) and the careers of Pausanias (I.128–30) and Themistocles (I.135–38) to some extent take up where Herodotus leaves off. But Thucydides never claimed to be writing a history of Persia. He touches on Persia only peripherally, when it allows him to answer the question he proposes with regard to the trigger of the Peloponnesian War: How did Athens acquire the power it wielded in 432, during the period known as the Fifty Years (*Pentakonta*) (I.89.1; 118)? Of course, his analysis does offer passages that also touch on the history of Persia, such as the story of the Athenian expedition to Egypt (I.104, 109). But to privilege these passages is likely to accord too much weight to the Mediterranean region of the Empire. The same considerations hold for the works of other authors, such as Diodorus Siculus or even Plutarch (*Themistocles*, *Aristides*, *Cimon*). The reigns of Xerxes and his successors cannot be reduced to the ups and downs of Persian battles with Athens in the Aegean Sea (cf. Plutarch, *Them.* 31.3).

Ctesias's narrative contribution is weak and dubious, and Photius's summary, aside from the mention of a Babylonian revolt (§§21–22), illustrates the same glaring inadequacies as Ctesias. Not only does Ctesias's tale of Xerxes' expedition swarm with errors (§§23–27), but the period 479–466 is covered in a couple of sentences on the extramarital affairs of his daughter Amytis (wife of Megabyzus) and the plot in which the king lost his life (§§28–29). It seems clear that beginning with §22, Ctesias is less interested in dynastic history than in the saga of the family of Megabyzus, to which he devotes long passages, up through the death of the last son of Megabyzus, Zopyrus II, during the reign of Artaxerxes I (§43). No other Classical author fills in the gaps. We find the same imbalance in Justin (III.1.1) and Aelian (VH, XIII.3): "Xerxes, king of Persia, formerly the terror of the world, began to be despised even by his subjects" (Justin); "against the Greeks he came off badly, and on his return he suffered a most shameful death, murdered one night in bed by his son" (Aelian◊).

The Idea of Decadence

In every case, the year 479 is presented implicitly or explicitly as a crucial date, after which began the long death-throes of the Empire created by Cyrus, Cambyses, and

Darius. Plato, who widened the interpretation to Achaemenid history in its entirety, also believed this. In his passage on the link between Persian decadence and the way that the royal children were educated, he highlights the case of Xerxes and concludes: "Ever since then, hardly any king of the Persians has been genuinely 'great,' except in style and title" (*Laws* 695e♦). Plato also compares Xerxes and Cambyses; the parallel is found in Arrian as well (IV.11.6). In Greek eyes, both were typical examples of mad despots. Plato also contrasts Xerxes with Darius, who, not being the son of a king, was not subjected to the deplorable influence of the palace women and so was able to maintain a robust policy and "added to the territory Cyrus had bequeathed at least as much again" (*Laws* 695d♦).

The same contrast is also found in Aeschylus, who is responsible for an equally powerful contribution to the dismal reputation of Xerxes. Darius was a "king without peer" (650), a "benevolent father" (665–70), "the beloved head of Susiana" (555–56), "the all-powerful, benevolent, invincible, equal to the gods" (853–55). By contrast, Xerxes was weak, childish in his tactical choices (353–64); he was a coward, inasmuch as immediately after the defeat at Salamis, "he hurled himself into headlong flight" (469–70). To organize the contrast more clearly, the poet brings on the ghost of Darius, who denounces his son, who has lost his senses (829–31), and repeats the typically Greek accusation of immoderation (*hybris*) against Xerxes, who had had the gall to throw a bridge across the sea (715–25, 740ff.). Xerxes himself despairs of his defeats and failings (908–15, 934ff.). He is responsible for unspeakable disaster, for the loss of a multitude of men, many of high birth (441–44, 765ff.). All of Asia is stripped of its substance (550), "an entire people lost in combat" (728–31); "only a handful of survivors" can be counted (510). In Aeschylus's version, the consequences of the defeats are catastrophic for the Empire of the Great King. Salamis is "the tomb of Persian power" (596). At last comes the familiar apostrophe of the chorus:

And for a long time, on the land of Asia, the law of the Persians will no longer be obeyed; tribute will no longer be paid under imperial duress; one will no longer fall to one's knees to receive commands; the force of the Great King is no more. Tongues will no longer be gagged. A people is released and speaks freely, as soon as the yoke of force is removed. (585–95)

It is passing strange that even in modern works this passage of Aeschylus is cited to justify a conclusion that the Achaemenid Empire was in irreversible decline and that Xerxes was extremely weak, reduced to busying himself with his construction projects at Persepolis and to wallowing in delight in the dissolute charms of the harem!

Furthermore, the Hellenocentric view has infiltrated Iranian studies. Consider the interpretation traditionally suggested for Xerxes' *daivā* inscription (see below, 519). The weak, cruel, and licentious Xerxes moreover became the very symbol of religious intolerance: "A new note sounds, a note peculiar to Xerxes: the note of a profound but intolerant religiosity." Reliance on Hellenistic-period sources leads to the insistence that Xerxes seriously modified the policy of his predecessors, whether in Babylonia or Egypt. "Once he had suppressed the Egyptian rebellion, he stripped himself of his Egyptian royal name and treated this land of venerable culture as an ordinary satrapy; by demolishing the Mardūk temple, he broke the hearts of the Babylonian priests, who had opened their gates to Cyrus." To be sure, the Empire "remained standing," but "its internal erosion is the only way, in the eyes of a disconcerted world, to understand how all

this magnificence crumbled to ruins under the gigantic fist of Alexander” (M. Mayrhofer). And so we have come back to Plato, after a winding detour through the sources from the center, themselves revisited by Alexander’s *Vulgate!*

History and Documentation

It has been possible to propose such reconstructions only because the very idea of decadence pervades all of Western literature on “Asiatic despotism.” Nonetheless, the reconstructions are not based solely on blind confidence in the Greek sources. Methodologically, they also depend on mechanically appropriating unevenly distributed evidence directly into narrative exposition. For, beginning with Xerxes, the sources from the center are significantly less abundant and diverse than under Darius. The number of Babylonian and Egyptian documents is drastically reduced. The archaeological evidence, most of the Treasury tablets, and a number of the royal inscriptions basically refer to the building activities of the Great King. Not all of the royal inscriptions are concentrated at Susa and Persepolis; one text refers to the existence of royal workshops at Ecbatana (XH); another, located close to one of Darius’s inscriptions (DE), is carved on the Mt. Elvend near Ecbatana (XE); and lastly, a third has been discovered near Lake Van in Armenia (XV). But it is a delicate task to draw consistent historical inferences from such inscriptions. The fact remains: the sources for Xerxes’ reign are inadequate and fragmentary; consequently, it is impossible to reconstruct a continuous narrative history. But to deduce from this that beginning in 479 Xerxes lost interest in political problems and devoted himself solely to the embellishment of Persepolis is the result of a peculiar sort of historical method based, one might say, on the fact that the narrative evidence falls silent. To put it another way, the obvious distortions of the polemical Greek sources’ memory of Xerxes lead the historian to question this still-lively thesis and to take another look at the historical significance of Xerxes’ reign.

2. From Darius to Xerxes

Herodotus’s Presentation and Xerxes’ Statement

“Upon returning to Persia, Darius offered sacrifices and died. . . . The throne passed to his son Xerxes.” With these simple words, Ctesias, or at least Photius, treats the succession of Darius (§§19–20)—leaving the historian grasping at straws. Though the king was a man above men, he himself was no less subject to political constraints. The conflict between Cambyses and Bardiya and then the accession of Darius had eloquently illustrated the difficulty of transferring royal power, even when the successor of the king (Cyrus) had been chosen during his lifetime. The basic question is this: Did the Achaemenid court have rules for the transmission of power? At Behistun, as we have seen, Darius insists (not without fabrication) on the importance that he accorded to succession. In his mind, there was no doubt that his power had to be passed to one of his sons in such a way as to guarantee dynastic continuity.

At the beginning of book VII (2–4), Herodotus dedicates a long passage to Darius’s preparation for his succession, which he places at the moment of the Egyptian rebellion, four years after the battle of Marathon (486) (VII.1):

A violent quarrel (*stasis*) broke out between Darius’ sons on the question of priority and succession (*peri tes hegemoniēs*). . . . Darius before his accession had three sons by his former wife, Gobryas’ daughter, and four more after his accession by Atossa the daughter of Cyrus. The eldest of the first three was Artobazanes, and of the last four Xerxes. It was between these two, therefore, being sons of different mothers, that the dispute arose. (VII.2↔)

Whom to choose? Artobazanes argued “that he was the eldest of all Darius’ sons (*presbutatos . . . pantos tou genou*)” (VII.2♠). Xerxes stressed the prestige of his ancestry, which, through his mother, went back to the founder of the Empire, Cyrus. Still following Herodotus, we learn that Darius was uncertain, and his hesitancy was fanned by arguments whispered to Xerxes by the Spartan Demaratus (driven out of his homeland, he had just appeared before the king). Referring to the Spartan model, Demaratus argued that Xerxes’ rights were unsurpassed because he was born when his father, Darius, was king, which was not the case for Artobazanes, who was born when his father was just an ordinary person (*idiōtēs*: VII.3). The end of the story is:

Xerxes adopted the suggestion and Darius, recognizing the justice of the argument, proclaimed him heir to the throne. Personally, I believe that even without this advice from Demaratus, Xerxes would have become king, because of the immense influence of Atossa (*eikhe to pan kratos*). Xerxes, then, was publicly proclaimed as next in succession to the crown, and Darius was free to turn his attention to the war. . . . (VII.5♠)

Xerxes in turn referred to his father’s choice in a famous inscription (XPf). After recalling the accession of his father, while Hystaspes and Arsames were still alive, he wrote:

Saith Xerxes the king: Other sons of Darius there were, (but)—thus unto Ahuramazda was the desire—Darius my father made me the greatest (*mabīsta*) after himself. When my father Darius went away from the throne [died], by the will of Ahuramazda I became king on my father’s throne. (XPf §4♠)

There is at least one point on which Herodotus and Xerxes agree: that Darius chose between several of his sons. Contrary to Herodotus, who presents the succession as a duel between Xerxes and Artobazanes, Xerxes refers to his other brothers in such a way as to deny implicitly that any of them had a special right to argue against him. Xerxes was certainly thinking (without naming them) of his three full brothers, the only ones who shared the same ancestry; according to Herodotus, they were Achaemenes (VII.7, 97), Masistes (VII.82; IX.107), and Hystaspes (VII.64). But even on this point divergent traditions were in circulation because, as we shall see, some authors introduce an Ariaramnes. At the same time, the very fact that Xerxes inscribed such a statement (which has no parallel) and the fact of his insistence on his “victory” over his brothers also seem to confirm that he had overcome some form of opposition.

Chronology and nomos

The importance of Herodotus’s text must not be underestimated. But his presentation also poses several problems of interpretation, as much on the modalities as on the reasons for the choice of royal heir. Herodotus places the succession decision at the moment of “Darius’ resolve to go to war, not only against Greece but against Egypt too.” It was under pressure from his sons that Darius decided to settle the succession, “for [they said] according to Persian law (*kata ton Perseōn nomon*) the king may not march with his army until he has named his successor” (VII.2♠). No other example confirms the existence of this custom. To be sure, before crossing the Araxes, Cyrus had sent his son Cambyses home to Persia, under the guard of Croesus: “He intended to bestow royalty on Cambyses,” Herodotus remarks, clearly letting it be understood that in case of misfortune, Cambyses would succeed Cyrus (I.208). But Cyrus had made his choice many years earlier, as is shown by his granting Cambyses the title “king of Babylon” for a short time in 538–537. And above all, this was not Cyrus’s first campaign. The same, obviously, holds for Darius. If the date given by Herodotus is correct, we must conclude that

Darius had waited quite a long time: in 486, he was about 65 years old (cf. Herodotus I.209); Xerxes must have been around 30 or 35 (his parents' marriage was in 522). It seems hard to believe that, if Darius was about to found a new royal stock and a new dynastic legitimacy, he had not long since taken measures to ensure continuity with the son he had chosen. We may thus suppose that official recognition predated 490–486, without being able to prove this or to suggest a more precise date. In other words, what Herodotus calls a *nomos* was not in any way obligatory; furthermore, this is an observation that can be made on the basis of an analysis of the word *nomos* in the context of each succession (see chap. 17/1).

Darius, Xerxes, and Atossa

Furthermore, it is clearly erroneous to state that the prince's mother, Atossa in this case, had a right to interfere. Although in actuality the mother of the crown prince (and then of the reigning king) had prestigious status at court (cf. Aelian, *Anim.* IV.46), there was strictly speaking no Achaemenid queen (despite, e.g., Athenaeus XIII.556b). The mother of the crown prince had no special rights. She could perhaps wield her personal influence, but nothing more. In addition, Xerxes in his declaration of legitimacy breathes not a word about Atossa, which he could not have failed to do had she exercised the sort of power sometimes accorded her on the basis of Herodotus. On the contrary, he insists on the patrilinear transmission of power (XPf §3). Dynastic legitimacy was not established by way of the mother. The prestigious status that Atossa had at court was because one of her sons held the status of heir. Darius chose Xerxes for entirely different reasons, which have already been discussed (chap. 3/4). To choose Artobarzanes would have been to confer on the family of Gobryas a distinction absolutely in opposition to Darius's objectives as revealed by his policy of endogamy: to retain power only for his own direct descendants.

The Crown Prince

The designated son did not become designated heir until a special ceremony, alluded to by Plutarch: "It was the rule and usage of Persia, that the heir apparent to the crown should beg a boon, and that he that declared him so should give whatever he asked, provided it were within the sphere of his power" (*Art.* 26.5♦). If we recall the rules covering the King's birthday banquet (Herodotus IX.110), we can see that it is likely that this proclamation was made during this banquet or during the feast marking the crown prince's birthday. Thereafter, the prince, like his father, had the right "to wear the upright hat (*kidaris*), as they called it," adds Plutarch.♦ His prestigious status is demonstrated by his presence behind his father in the audience reliefs in the Persepolis treasury. It is also possible that from then on he bore a special title (**visa-puthra*) that distinguished him from all of the other princes of the [royal] house (*br byt*?). But this Old Persian title is a reconstruction, unattested in any Old Persian text. Xerxes simply states that Darius awarded him the title or designation *mabīšta* 'the greatest [after him]', a word rendered in the Classical sources 'second after the king'.

A Principle of Primogeniture?

But which of his sons did the king choose during his lifetime to succeed him? In other words, does the example of Xerxes illustrate a general rule? According to Plutarch—who makes a point of recalling the precedent of Demaratus at this point—iden-

tical arguments were made at the court of Darius II to decide between Cyrus the Younger and the future Artaxerxes II (*Art.* 2.4). The similarity between the successions of Darius I and Darius II becomes even more striking when we note that, like Atossa, Parysatis (mother of the princes) vigorously intervened in the discussion, with quite different results. Plutarch says that to decide the succession of Artaxerxes II, appeal was made to primogeniture, "as he himself [Artaxerxes] had received the [kingdom]" (26.1♦). The difference between Atossa and Demaratus is that the arguments proffered by Parysatis in support of the child born to the purple had no effect whatsoever.

Several other texts imply that the oldest child held a position of special prestige. A text by Agathocles of Cyzicus, quoted by Athenaeus (XII.515a♦), provides the following information: "In Persia there is also water called 'golden.' This water consists of seventy bubbling pools, and none may drink of it save the king and his eldest son (*presbyatos*); if anyone else drinks it, the penalty is death." The custom is difficult to understand precisely, but the comment is unambiguous regarding the privileged place of the oldest son. Let us also quote Plato: "When the eldest son (*ho presbyatos pais*) and heir to the throne (*houper hē arkhē*) is born, all the king's subjects have a feast day" (*Alc.* 121c♦). For Plato, the king's birthday banquet (Herodotus IX.110) was nothing but a repetition of the original feast: "Then, in the years that follow, the whole of Asia celebrates that day, the king's birthday, with further sacrifice and feasting."♦

Plato also states that from birth the newborn was entrusted to hand-picked eunuchs: "They attend to all the needs of the infant child, and are especially concerned to make him as handsome as possible, shaping and straightening his infant limbs" (121d♦). Behind the picturesque description is a political idea: the first son, called to succeed his father, must be made into the image of a king, who by definition is tall and handsome (chap. 6/4). Plato goes on to say that later the child was entrusted to educational specialists. Like other young men, he received a military education (horsemanship, hunt, courage, Truth) (*Alc.* 121e–122a). Additionally, Strabo says that the heads of groups are chosen from "among the sons of the king or satrap" (XV.3.18♦). At the same time, Plato mentions the existence of "royal pedagogues" to whom the crown prince was entrusted at the age of 14. Even though Plato does not use the word, apparently some of these royal pedagogues were *magi*, since one of them (the wisest [*sophōtatos*]) "instructs him in . . . the Magian lore" (122a;♦ cf. Plutarch, *Art.* 3.3). It is a *magus* who "instructs him . . . in what a king should know (*didaskei de kai ta basilika*)" (*Alc.* 122a♦) and, according to Cicero (*Div.* 1.41.91), "no one could be king of Persia who had not previously received instruction in the wisdom of the magi." In short, from earliest childhood on, the oldest son was prepared to take up his royal duties and to assume his rank in the political, military, and religious hierarchy. The preference given the oldest is confirmed statistically as well. The custom is easy enough to understand. First and foremost, succession to the throne was no different from familial succession: to take one's father's throne was also to receive and make fruitful the heritage of the royal House, which quite naturally was entrusted to the oldest. In a way, Darius's choice did not formally contradict this point: once Artobarzanes was out of the picture, for political reasons that have been cited, the king's choice fell on the oldest of his sons born to Atossa.

At the same time, analysis of the concrete situations leads us to offer several corrections. Plato's expression ("heir to the throne") is certainly exaggerated. The oldest son was not the only one entrusted to "royal pedagogues" (Plato himself uses the plural).

Plutarch introduces the *magus* from whom Cyrus the Younger received lessons (Art. 3.3); Cyrus was "educated with his brother and the other boys" (Xenophon, *Anab.* 1.9.2♦). Given the risk of infant mortality (cf. Ctesias §49), any heir, whether or not he was the oldest, would normally have received a royal education. Moreover, in every case, the king's choice remained entirely free. The exclusion of Artobarzanes, the arguments exchanged, and the frequently attested intervention of the court cabal in favor of one or another competitor seem to confirm that there was no fixed rule and that the preference for the oldest son (Artaxerxes I and Artaxerxes II) related more to incidental conditions than to mandatory rules. And last but certainly not least, the official recognition of a crown prince in no way signified a sharing of power: the king was One. Despite the crown prince's undeniably prestigious status, he himself was not exempt from royal disfavor. This is clearly seen in the story of the relations between Artaxerxes II and his son Darius, who was convicted of treason and was put to death (Plutarch, Art. 26-29).

Funeral Ceremonies

The death of the king was observed by the extinguishing of the sacred Fires, as shown in the steps taken by Alexander after the death of his beloved friend Haephestion:

He proclaimed to all the peoples of Asia that they should sedulously quench what the Persians call the sacred fire, until such time as the funeral should be ended. This was the custom of the Persians when their kings died, and people thought that the order was an ill omen, and that heaven was foretelling the king's own death. (Diodorus XVII.114.4-5♦)

This decree was a way of symbolizing that life was temporarily suspended until a new king was proclaimed. It was the start of a period of mourning, like the period decreed by Alexander in the same circumstances: he "commanded mourning throughout the whole barbarian country" (Arrian VII.14.9♦); or the period proclaimed at the death of Alexander (Quintus Curtius X.5.18); or the one ordered by Artaxerxes II when the eunuch Tiridates died (Aelian, VH XII.1). It was customary for Persians to shave their heads as a sign of affliction (cf. Herodotus IX.24; Arrian VII.14.4; Plutarch, *Alex.* 72.1).

Herodotus compares Spartan and barbarian customs: "One custom is observed on the occasion of a king's death, which is the same in Sparta as in Asia." In Sparta, the whole population gathers "wailing as if they could never stop" (VI.58;♦ cf. III.65 and IX.24 for the Persians). The contributions of subject peoples (including financial contributions) when a Great King died appears to be well established (Diodorus XVII.114.4). Herodotus continues: "If a king is killed in war, they make a statue (*eidōlon*) of him, and carry it to burial on a richly-draped bier."♦ The construction of an *eidōlon* of the deceased Persian king may also be alluded to by Aelian (VH XII.64). The dead king's remains were prepared by specialists. So it was with Alexander's body, which was embalmed by Egyptians and Chaldeans, "after their manner" (Quintus Curtius X.10.13♦). Since the royal tombs contained no bodies when they were discovered, we cannot say with certainty that the Great Kings were treated similarly. Herodotus (I.140) and Strabo (XV.3.20) say that the Persians coated the body with wax before burial, which probably provides another similarity with Lacedaemonian customs (cf. Plutarch, *Ages.* 40.1; Nepos, *Ages.* 8.7; Diodorus XV.93.6).

We know that the body of a deceased king was carried to the place of interment on a sumptuously ornamented chariot that must have resembled the funeral chariot of Alexander that is so carefully described by Diodorus (XVIII.26-28.1), before which the

entire populace crowded. It was the crown prince's responsibility to conduct the funeral rites. By presiding over them, he officially demonstrated his position as heir to the throne; he showed at the same time that the dead king continued to exist through his own life. It is also likely that each king in turn repeated Cambyses' custom of establishing permanent sacrifices around the tomb of the deceased king (cf. Ctesias §19).

Royal Investiture

At the end of all of these ceremonies came the royal investiture. For this topic our only source is Plutarch, who described the investiture of Artaxerxes II as follows:

It was not long after the decease of Darius [II] that the king, his successor, went to Pasargadae, to have the ceremony of his inauguration consummated by the Persian priests. There is a temple dedicated to a warlike goddess, whom one might liken to Minerva, into which when the royal person to be initiated has passed, he must strip himself of his own robe, and put on that which Cyrus the first wore before he was king; then, having devoured a frail of figs, he must eat turpentine, and drink a cup of sour milk. To which if they superadd any other rites, it is unknown to any but those that are present at them. (*Art.* 3.1-2♦)

Plutarch's last sentence confirms that the Greeks had sometimes heard of Persian cultic ceremonies, which they called "secret," on which they had nothing but inadequate oral information (cf. Herodotus I.140). It is clear that the enthronement ceremony in particular took place in the presence of only a small number of people. In addition to the prince himself, there were those whom Plutarch calls priests (*hiereis*), doubtless meaning the *magi*. According to Cicero, "no one could be king of Persia who had not previously received instruction in the wisdom of the magi" (*Div.* 1.41.90). Pliny mentions a certain stone "as being indispensable for the Magi at the installation of a king" (XXXVII.147♦). Plutarch (*Art.* 3.3) even seems to imply that these were the same *magi* who cared for the education of the crown prince.

Plutarch's interesting text nonetheless raises some questions. The ritual practices, basically, seem to have been well anchored in very ancient traditions, as shown by the reference to the robe of Cyrus the Great. The "initiate's" menu testifies to this as well, with its basis in milk and herbs (in which the *magi* also specialized; see chap. 7/2). But was the initiation ceremony he described immutable, or did it undergo alterations during the time of Artaxerxes II or earlier? It is the location of the ceremony that is questionable. The warrior goddess is easily recognized as Anāhita. Since this goddess's cult seems to have assumed new importance at the time of Artaxerxes II (chap. 15/8), we may well ask whether the ceremony took place in a different location prior to Artaxerxes II. It is also likely that the ceremony included an invocation of Ahura-Mazda. Several times, Darius used the formula "Ahura-Mazda granted me the kingdom." Perhaps this referred to a portion of the ceremony in which the insignia of power were handed to the new king—namely, his robe (*kandys*) and shield.

In essence, the ceremonies took on two clearly visible characteristics. On the one hand, they showed that Achaemenid royalty was sacred: through the agency of the *magi*, the new king was invested with divinity. On the other, they exalted dynastic continuity by insisting that it was based on relationship with Cyrus the Elder. The transmission of the robe best illustrated and symbolized the transmission of power itself. By means of a garment "magically" considered to be the power itself, the prince changed from heir designate to Great King. It is possible that at the end of the ceremony he appeared in a

tour of Pasargadae to be acclaimed by the assembled crowds. To mark his accession, he remitted the people's tribute-debts (Herodotus VI.59). Doubtless he also confirmed (or revoked) the power of the satraps and governors of the Empire (Diodorus XI.71.2; Josephus, *Ant.* XI.185). Thus the great officials of the kingdom served at the pleasure of the reigning king and personally pledged their fealty to him.

The Successor of Darius

"After his death the crown passed to his son Xerxes." Herodotus puts it so simply (VII.4⇨). But it must be noted that Justin (II.10.1–11) and Plutarch (*Mor.* 173b and 488d–f) offer a version that differs at several points from that of Herodotus. They describe the debate as following the death of Darius, introducing (in the same words) an Ariaramnes in place of Artobarzanes; this Ariaramnes appears to have held a position in Bactria (173b; cf. 488d: "come down from Media" to meet Xerxes). The ancient authors insist that this was not a real revolt. Ariaramnes simply intended to put forward his claim as oldest son. Plutarch even sees this as an illustration of brotherly love. Xerxes sent gifts to Ariaramnes and had his envoys transmit the following message: as soon as Xerxes was recognized as king, he would recognize Ariaramnes as "second after the king." The dispute was settled by a paternal uncle (Artabanus in Plutarch, Artaphernes in Justin), who decided in favor of Xerxes. The judgment was accepted with good grace by Ariaramnes. Clearly, this version represents a corruption of Herodotus's version. Possibly Plutarch's and Justin's sources had blended in the romanticized story about Xerxes and his brother Masistes in 479, as reported by Herodotus (IX.108–13). Masistes appears to have been satrap of Bactria; he was humiliated by his brother, rebelled against him, and then was massacred along with "his sons and his army" by troops sent by the king. It is also possible that in the Greek tradition the name Masistes represents the Persian word *mabīšta*, so that Masistes and Ariaramnes were one and the same person, since according to Plutarch Xerxes conferred on Ariaramnes the title 'second after the king'—that is, *mabīšta*. While Plutarch's and Justin's version is scarcely credible overall, perhaps it is built upon a fact: that the naming of a crown prince did not necessarily eliminate competing brotherly ambitions. Plutarch times the quarrel between the death of Darius and the official recognition of the new king. This was a sensitive period, marked by official mourning throughout the Empire. Only afterward, it seems, could the coronation ceremonies at Pasargadae begin.

Several statements demonstrate the care with which the new king connected himself with the work and person of his father. Along with all the new buildings he says that he erected "after he [I] became king" (XPf §4; XSc), the new king mentions finishing and completing the work of Darius (XPf, XPg, XV). This was certainly true of the Susa Gate (XScd). References to work exclusively his own are fairly rare (XPb; XPd). Often, on his own buildings, he also invokes the protection of Ahura-Mazda on buildings that were built by his father (XPa, XPc, XSa, XScd) or that were built jointly: "What had been built by my father, that I protected, and other building I added. What moreover I built, and what my father built, all that by the favor of Ahuramazda we built" (XPf⇨). This statement is even more interesting because it is placed just after the reminder of his selection as crown prince and his accession. These statements are not unique: let us particularly recall an inscription in which Artaxerxes II links himself with his great-great-grandfather, Darius (A²Sa). It was a way of placing oneself in the dynastic line; Xerxes also never missed an opportunity to recall that he was the son of Darius, an Achaemenid.

Crushing Rebellions

Xerxes began by devoting himself to pursuing his father's imperial enterprise. Upon his accession, in fact, some territories were threatened not so much by the defeat at Marathon as by the Egyptian revolt that had arisen in Darius's time. In Herodotus's version, the Egyptian campaign was just a minor episode that delayed the Greek expedition a few months, an expedition that had been decided on shortly before, under the pressure of Mardonius and Medizing Greeks (VII.5–6). It appears nonetheless to have become sufficiently dangerous that Xerxes took personal command of the army (of course, this also allowed him to inaugurate his reign with a military expedition). Moreover, though it subsequently took another four years to prepare the army that was to march against Greece (VII.20), this was only because the troops and materiel assembled by Darius over the previous three years (VII.1) had been expended in the Egyptian expedition. After his victory, the king made his brother Achaemenes satrap in Egypt (484) (VII.7).

Some years later, perhaps in 481, another rebellion broke out in Babylonia, led by Bel-šimānni, who took the title "king of Babylon, king of the lands." The uprising was very short, lasting only some fifteen days. Nevertheless, it too reflects a troubled atmosphere, though we cannot state precisely either its origin or its causes. Despite this mood, however, the theory of a coincident revolt by Judah around 484 is inadequately grounded. It certainly goes too far to speak of a generalized state of insurrection, which would seriously have damaged preparations for the European expedition. We must simply say once again that the troubles in Egypt and Babylonia indicate that Darius's imperial policy had discovered its natural limits.

Returning to the Greek Affair

Xerxes was then able to return to his father's plan (VII.1) to march against Greece. Herodotus refers to reservations about such a plan on the part of the new king, but they were due solely to the need to put down the Egyptian rebellion first (VII.5, 7). He also refers to many disputes on the subject within the royal entourage. According to Herodotus, Xerxes made his decision under pressure from Mardonius and Greek exiles (VII.6–7). Herodotus also states that, after Xerxes returned from Egypt, he convened the highest Persian officials (*aristoi*). After announcing his decision to move against the Greeks (VII.8), he gave the floor to the most prestigious Persians. Mardonius supported the king, in particular stressing the weakness and disunity of the Greeks (VII.9–10). Artabanus, on the other hand, stressed the dangers of such an expedition, as he had done with Darius when he was preparing to move against the Scythians (VII.10); he was harshly dismissed by the king, who took him for a coward. However, after a dream, Xerxes reversed his original decision and decided not to march on the Greeks (VII.12–13). After dreaming the dream a second time, Xerxes had Artabanus put on his royal apparel, sit on his throne, and sleep in his bed. Artabanus had the same dream; thereafter, he urged Xerxes to conduct the expedition and, as a result, the king gave the order (VII.14–18). Herodotus then records that, after making his decision, Xerxes had a third vision; the *magi* who were consulted determined "that it portended the conquest of the world. . . . Xerxes, in the process of assembling his armies, had every corner of the continent ransacked" (VII.19♦).

This entire discussion by Herodotus raises strong suspicions, since both the speeches given and the arguments exchanged totally derive from a judgment *post eventum*. Herodotus insists that he got his information from the Persians (VII.12). It is entirely possible that Mardonius had a bad reputation among the Persians themselves. We know, for

example, the opposition that his strategy awoke in Artabazus in 480–479 (IX.41–42, 58, 66) and that Artabazus was honored by Xerxes after the war (Thucydides I.129.1). Perhaps the order that Xerxes gave to Artabanus is an example of the well-known Babylonian custom of substitute kings. But generally, Herodotus's tale is structured around literary motifs and human stereotypes that were easy for his listeners and readers to interpret. It was standard practice to contrast two counselors, one ambitious and stupid, the other wise and deliberate. This had the result, if not the intention, of portraying Xerxes as indecisive, even cowardly, which fits well with the traditional Greek presentation.

In truth, for Xerxes the situation was very clear. First of all, he had to take responsibility for the projects that his father had already gotten under way (cf. VII.1). He was confronted with rebellions and also had to prove his royal ability to lead a victorious military expedition. It must also be kept in mind that conducting an expedition on such a scale allowed the king to visit a large number of subject lands and to reconfirm the chains of command (see chap. 5/4). Furthermore, up to the borders of Greece, his itinerary scarcely differed from the periodic relocations of the court. When Xerxes left Sardis, the order of the royal procession was established according to traditional protocol, Xerxes himself "riding in a chariot drawn by Nisaeon horses" (VII.40♦), and this order held until after "crossing the bridge of boats" (VII.55). He was accompanied by his sons (VII.39; VIII.103–4) and many members of his immediate family. Peoples and tribes came to the royal caravan to pay homage to the sovereign and to offer him their gifts and presents (cf. VII.27). Cities and peoples received orders to prepare the King's Table in the appropriate manner (VII.32, 118–120). The king even played his role as protector of greenery (VII.31). In a way, this first portion of Xerxes' march assumed the primarily political nature that emerged from specifically Achaemenid concerns: it was on the same order as the reviews of the Empire conducted at Abydos (VII.44–45) and Doriscus (VII.59ff.). Throughout the journey, Xerxes showed off the power of the king and the Empire. While marching against Greece, he surveyed his territory and peoples, as he had already done on the journey between Babylon and Memphis: "He rejoiced in his prosperity" (VII.45; VII.100; cf. VII.57). To lead his army was to exalt his power as well as to seek to increase it with new conquests that would only impress the subject peoples even more. From this perspective, we can accept the rationale (if not the exact words) of the speech that Herodotus puts in the mouth of Mardonius, speaking to Xerxes: "When you have tamed the arrogance of Egypt, then lead an army against Athens. Do that, and your name will be held in honour all over the world, and people will think twice in future before they invade your country" (VII.5♦).

Of course, the military objective was clearly defined: it was not merely a matter of exacting vengeance on Athens but of actually conquering the Greeks (cf. VII.138). For this reason, Xerxes' expedition assumes a quite different character from the expedition that Datis had led ten years earlier. The magnitude of the preparations and the king's personal participation leave no doubt about it. By participating, Xerxes took on Darius's objectives; according to Herodotus, Darius had decided shortly after Datis's return to conquer Greece and had begun active preparations for the campaign, before the Egyptian revolt and his own demise temporarily interrupted the Persian plans (VII.1).

"The Unconquerable Swell of the Seas"

As soon as Xerxes returned from Egypt, he instituted a military draft throughout the Empire (VII.8, 19). Several times Aeschylus stresses the immensity of the army headed

by Xerxes: "monstrous human herd" (line 74), "broad human tide," comparable to "the unconquerable swell of the seas" (line 90). Herodotus gives statistics on the royal army as it approached Thermopylae: 277,610 soldiers on the warships (1,207 warships listed at Doriscus: VII.89); 240,000 men in the crews of the transport ships; 1,700,000 infantrymen, 80,000 horsemen, 20,000 Arab camel-riders and Libyan charioteers; add the troops drafted by Xerxes in Europe (300,000), and the total is 2,617,610 men. Herodotus also says that an equal number of "servants and camp followers, the crews of the provision boats and of other craft" have to be counted, and he thus reaches a total of more than five million men, not to mention, he adds, "as for eunuchs, female cooks, and soldiers' women, no one could attempt an estimate of their number . . ." (VII.184-87♦). Finally, feeding this immense horde (not counting the women, eunuchs, beasts of burden, or dogs) took more than five million liters of flour per day. We are thus not terribly surprised at Herodotus's assessment that "the rivers sometimes failed to provide enough water" (VII.187♦)—a particularly powerful image, extremely popular throughout Antiquity (cf. Philostratus, *Vit. Apoll.* 1.25).

For a long time, Herodotus's statistics were judged unacceptable, if only for purely logistical reasons. It is clear that some of the figures reflect ancient models, such as the number of ships (1,207 in Aeschylus and Herodotus), which may go back to the Homeric Catalogue of Ships. Furthermore, to stress the utterly novel character of Xerxes' army, Herodotus explicitly refers to the Trojan War (VII.20). Other ancient authors' statistics seem no more credible: from 700,000 (Isocrates) to 3,000,000 (Simonides). All share a Greek perspective when they calculate the armies of Darius III; their motive is to exaggerate the glory of the Greek warriors who defeated them.

Everyone agrees with this assessment. But the problem is that most attempts to interpret Herodotus rely on dangerous assumptions and comparisons, and as a result, the modern estimates differ considerably from one another. The state of affairs thus requires us to argue for plausible solutions. If we agree on the one hand that, for reasons already given (chap. 5/5), the review at Doriscus should be set aside, and on the other, that in the only battle fought on Greek soil (Plataea), the Persian forces did not greatly outnumber the Greek forces, then we arrive at a figure of about 60,000 men for the army of Mardonius. We agree that this is no more than one guess among many; but the advantage of this estimate is that it is based on the account of a battle and that it renders the forces involved considerably more even. We may make the same comment regarding the warships. The figure 1,207 is traditional, even mythical, and Herodotus doubtless took it from Aeschylus. It seems clear that the triremes in the royal fleet could not have greatly outnumbered the Greek warships at Salamis. Taking into account the Persian losses at Artemisium, a figure around 600 is probably much closer to reality than the 1,207 of Aeschylus and Herodotus.

As Herodotus rightly says, it makes sense to add the noncombatants to the fighting forces. There were certainly many of them, since every relocation of the king and court required an immense staff. But if we do not try to give an overall estimate, as Herodotus himself refused to do (VII.187), then out of this whole crowd we could simply consider the army's servants. A Babylonian document from 513 (*Dar.* 253) allows us to offer a plausible estimate: a horseman obeying the summons was accompanied by twelve lightly-armed men to equip and protect him (on the model of the *helots* in the Spartan army).

Logistical Preparations

According to Herodotus, the preparations lasted no less than four years (VII.20). It was not just a matter of assembling the men; it was also necessary to mobilize immense production capacity to guarantee the logistics of the expedition. A number of supply depots were set up in well-chosen locations—Leuce Acte in Thrace, Tyrodiza (near Perinthus), the strongholds of Doriscus and Eion, and Macedonia. Numerous transport ships were assembled for the purpose, with the supplies coming “from throughout Asia” (VII.25; 37). Thousands of workers were needed to dig a canal across the Mount Athos (Acte) Peninsula (because the king’s advisers remembered the wreck of Mardonius’s fleet in 492) and to build bridges across the Strymon (VII.22–24). Constructing two bridges across the Bosphorus certainly required long months of labor, and the first attempt was ruined by a storm (VII.33–37). Meanwhile, the Great King and his generals had assembled the contingents, initially at Critalla in Cappadocia and then at Sardis (VII.26). After wintering at the Lydian capital (481–480), the king and the army set out for the Hellespont and Greece at the beginning of the spring of 480 (VII.37).

3. *From Sardis to Sardis (480)*

The Persian Advance and Greek Strategy

From Doriscus, Xerxes set out for Thrace, gradually conscripting new contingents from the subject peoples. He crossed the Strymon on the bridge that had been built previously (VII.105, 118–16). The troops had been divided into three contingents, each assigned to a high official (VII.121). When they reached Acanthus, he sent the navy to await him at Therma at the mouth of the gulf (VII.121). After the armies were recombined in this town, the force turned toward Pieria, where he learned that most of the peoples and cities of central Greece had agreed to “give [tokens of submission of] earth and water” (VII.132♣). Of course, as Herodotus explains (VII.172), they scarcely had any choice. Shortly before, the Greeks gathered at the Isthmus of Corinth had sent a contingent near Tempe to bar the way. But as soon as they learned from King Alexander of Macedonia that the royal army was able take a different route, the troops departed: “The result of it was that the Thessalians, finding themselves without support, no longer hesitated but whole-heartedly worked in the Persian interest, so that in the course of the war they proved of the greatest use to Xerxes” (VII.174♣). Herodotus was certainly simplifying. It is clear that from the start some of the Thessalian leaders (the Aleuadae) favored alliance with the Persians (VII.6). As in 490, the Persians understood how to exploit internal differences among the Greek states, many of which were prepared to “Medize.” In a passage that is very favorable to Athens, Herodotus even goes so far as to say, whether his listeners would believe him or not, that the majority of Greeks “were all too ready to accept Persian dominion,” since the inequality of the military forces appeared to be an insurmountable problem (VII.138♣). As for the Phocaeans, if they were the only central Greek people who did not join the Persian cause, it was, Herodotus says, because of their age-old enmity toward the Thessalians (VIII.30). Let us also recall that Demaratus of Sparta remained in Xerxes’ entourage, and there were also representatives of the family of the Pisistratids with him. One of the objectives of the expedition, therefore, must have been to install client governments in many of the Greek states (cf. VIII.54–55).

After lengthy discussions, the Greeks decided to face Xerxes at a line of defense on land at Thermopylae and at sea at the Artemisium Promontory, two sites very close together (VII.175). When a detachment of royal ships sailed as far as Therma, the Greeks left Artemisium and dropped anchor at Chalcis, "intending to guard the Euripus, and leaving look-outs on the high ground of Euboea" (VII.183♦). As Xerxes continued his march toward Thermopylae (VII.198–201), part of the fleet (moored near Cape Sepias) was destroyed by an unexpected storm (VII.190–92)—a real disaster according to Herodotus, since a large number of warships and grain transports were lost, "and men beyond reckoning." On land, despite the resistance of the Greeks (to whose heroism Herodotus devotes a passage of disproportionate length: VII.201–39), the Persians took the pass at Thermopylae. Meanwhile, the Greek navy (commanded by the Spartan Eurybiades) had dropped anchor near Artemisium. Herodotus says that the Athenian Themistocles managed to persuade the Greeks to hold their position despite the defeat at Thermopylae. Persian losses were heavy, not only at the hands of the Greeks, but also because another storm had struck a portion of the royal ships that were attempting to skirt Euboea to fall on the Greeks from behind. Nonetheless, from the perspective of the Persian general staff, the objective had been achieved: the road to Greece was open (August 480). The royal army immediately entered central Greece, receiving the support of the "Medizers" (VIII.34–39).

From Thermopylae to Salamis

The most significant result of the Persian victories was probably on the political plane. On the authority of Themistocles, the Greek ships had moored in the harbor of Salamis. According to Herodotus, the Athenians were disheartened by the attitude of the Peloponnesians, who rather than advancing into central Greece had fortified the Isthmus of Corinth to create a barrier against the Persian advance. The Athenians' "object was to give themselves an opportunity of getting their women and children out of Attica, and also of discussing their next move" (VIII.40♦). To make a long story short, the Athenian/Spartan quarrel, which had already surfaced in the context of choosing a commander, broke out again. The question regarding strategy was taken to the council of the commanders of the Greek naval contingents that had meanwhile all returned to Salamis. Despite Spartan reluctance to do battle far from their bases, Themistocles managed to convince Eurybiades that the only solution was to confront the royal fleet in the Bay of Salamis. Additional plans were formed: on land, the Lacedaemonians would continue to mass their forces on the isthmus (VIII.70–74); the Athenian population was forced to leave the town and countryside and go into exile (VIII.40–64). The battle that ensued in the Bay of Salamis ended with a resounding defeat of Xerxes' fleet (VIII.76–96; September 480).

From Salamis to Sardis

Not content to celebrate the victory—understandably—every Greek author, to a man, stresses the indecision and cowardice shown by Xerxes, who was concerned more than anything else with "impassioned flight" (Aeschylus) in order to escape the consequences of the defeat. It is clear that the news of the defeat at Salamis dumbfounded the Persians, who were undoubtedly very conscious of their superiority, including the Persians remaining in the royal residences who, according to Herodotus, were already preparing to receive Xerxes in triumph (VIII.99). These are the circumstances on which

Herodotus built the exchange that he recounts between Mardonius and the king after the battle (VIII.100–101). Mardonius, anxious to clear himself of the accusation of having recommended an expedition that turned out badly, suggested to Xerxes (of whose preparations for flight he was not unaware: VIII.97) that he leave him an army with which he would “deliver Greece to him in chains” (VIII.100♠). Again according to Herodotus, Xerxes had his young illegitimate sons leave for Asia Minor under the protection of Artemisia of Caria (VIII.103–4). And, several days after the battle, he departed Attica with the army (VIII.113). When he arrived in Thessaly, he left Mardonius an army of elite troops and traveled to the Hellespont in 45 days (VIII.115), after which he pressed on to Sardis (VIII.117). Herodotus portrays Xerxes’ retreat apocalyptically:

He reached the crossing in forty-five days, but with hardly a fraction of his army intact. During the march the troops lived off the country as best they could, eating grass where they found no grain, and stripping the bark and leaves off trees of all sorts, cultivated or wild, to stay their hunger. They left nothing anywhere, so hard were they put to it for supplies. Plague and dysentery attacked them; many died, and others who fell sick were left behind. . . . The Persians having passed through Thrace reached the passage over the Hellespont and lost no time in getting across to Abydos. They crossed, however, in ships, as they found the bridges no longer in position, bad weather having broken them up. Food was more plentiful at Abydos than what they had been making do with on the march, with the result that the men over-ate themselves, and this, combined with the change of water, caused many deaths in what remained of the army. The remnant proceeded with Xerxes to Sardis. (VIII.115, 117♠)

Herodotus probably got this version—repeated by many ancient authors (e.g., Justin II.13.11–12)—from Aeschylus (lines 480–515). First of all, it is a literary theme, doubtless bearing only the most tenuous connection to reality. Even if the retreat faced difficult climatic conditions, it is hard to believe that the quartermasters’ stocks were completely exhausted. Herodotus records other versions that were circulating in his day, suggesting that Xerxes had returned to the Asian coast by sea. Each version highlights the Great King’s cruelty (VII.118–19). But Herodotus rejects these stories, contending that Xerxes had indeed passed through Abdera and thanked the inhabitants with a pact of friendship and with a gift of a gold *akinakēs* (‘sword’) and a gold-embroidered headband (VII.120). Nonetheless, Classical tradition preserves the versions contested by Herodotus, as in Justin’s tale, which is both dramatic and moralizing (II.13.9–10):

Xerxes found the bridges broken and crossed hastily in a fishing boat. This was quite a sight, and it really brought the men’s circumstances home to them, after an amazing turn of events, to see him huddled in a little craft—a man that formerly the entire ocean could barely contain and that had overworked the land with his countless ground troops—and now he was without a single slave to serve him.

The potential criticisms of the ancient stories should not lead us to believe, however, that the Persian situation was the same in September 480 as it had been a few months earlier. The defeat had certainly weakened some imperial positions. When he returned to Asia Minor (where he had accompanied Xerxes), Artabazus besieged Potidaea (albeit unsuccessfully): “The people of Potidaea . . . had openly thrown off the Persian yoke as soon as Xerxes passed them on his march to the eastward and they knew of the flight of the Persian fleet from Salamis” (VIII.126♠). Herodotus’s story of the king’s retreat makes it very clear that several Thracian peoples had severed their ties of allegiance (VII.115–16). It probably goes too far to suggest that the cities of Asia Minor were ready to rebel at this

date: this idea comes from a somewhat suspect view worked out by Herodotus and fourth-century authors, especially Ephorus, who was extensively used by Diodorus. Some time before the defeat at Salamis, according to Herodotus (VIII.19, 22–23), Themistocles had attempted to detach the Ionian contingents from the royal navy—with no success (VIII.85). We also know that after Salamis, the Greek victors sent ships to the Cyclades, besieging Andros there and extorting money from the other islands (Herodotus VIII.111–12); but Herodotus explains that they were not in a position to undertake an assault on the islands that Datis had conquered in 490.

All in all, despite the resounding defeat, the military outcome was not catastrophic. The Persian army was practically intact; it was able to hold the countryside, even to move against the fortifications raised by the Lacedaemonians at the entrance to the isthmus (as the Spartans were perfectly well aware). As for the navy, it was certainly not completely destroyed: the Greeks still feared it. One of the reasons offered by the Greek authors for Xerxes' retreat to Sardis was that he feared the Greeks would cut the bridges at the Hellespont, which would trap him in Europe (VIII.97). According to a widespread (but surely imaginary) tradition of the Greek authors, it was Themistocles himself who secretly had a message sent to Xerxes to that effect, in order to force him and the Persians to return to Asia. Many Greek leaders believed, after the battle, that the Persian general staff was preparing a new offensive.

But Xerxes and his advisers chose a different strategy: they decided to divide their forces. Mardonius was given the job of pursuing the offensive in Greece, with the army. Xerxes returned to Sardis, along with the navy. He must have remained there throughout the summer of 479. Thus, there was never the possibility that the Great King would hurl himself into "headlong flight." At Sardis he was in constant communication with Mardonius, and he continued to oversee the entire operation. The plan had a further advantage: the presence of Mardonius in Greece prevented the Greeks from embarking on a cruise through the islands, and thus everyone knew that the decisive battle would take place on Greek soil.

4. Xerxes between Two Fronts (480–479)

Xerxes in Sardis and Mardonius in Europe

In the spring of 479, it appears, Mardonius was definitely ready to take the offensive. He was certainly convinced of his military superiority. He did not come to this conclusion simply because he was a vain and conceited character, as so conveniently highlighted by Herodotus (cf. IX.3); instead, he must have been aware that the Spartans were putting all their effort into completing the wall across the isthmus that they felt was the utmost priority (IX.7): "The wall was not complete—they were still working at it, in great fear of the Persians" (IX.8♦). And meanwhile, Mardonius had received a letter from Xerxes ordering him to contact the Athenians, with the following words:

The king's orders to him are, first, to restore to Athens her territory, and, secondly, to allow her to choose in addition whatever other territory she wishes, and to enjoy her liberty. Let Athens but come to terms with the king, and he has his instructions to rebuild the temples which have been destroyed by fire." (VIII.140♦)

The goal of the Persians, as Mardonius understood it, was to divide the Greeks more deeply—specifically, to prevent real military cooperation between the Athenians and the Spartans: "If only he could form an alliance with them [the Athenians], he would have

no difficulty in getting the mastery of the sea . . . while he was already confident of his superiority on land" (VIII.136♦). The Persians probably also felt that pro-Persian elements were at work in Athens, as before. They had already won the allegiance of the Tegeates, who were committed to preventing a Spartan army from entering the isthmus (IX.12). In order to be sure he was holding all the cards, Mardonius entrusted the mission to Alexander of Macedonia, who on the one hand was related by kin to the Persians and on the other had more than an official relationship with the Athenians (VIII.136).

The Spartans were uneasy. They had also sent a deputation to Athens, and they spoke to the Athenian council after Alexander. The Athenians rebuffed the overtures from Mardonius, but they presented the Spartans with an ultimatum: if, as the Spartans had threatened, they refused to send an army to assist the Athenians, they would have to take their chances with the Persians (VIII.141-44). When Mardonius received the Athenians' response, he marched against Attica, which once again was evacuated, and he made Xerxes aware of his victory by means of signal fires from island to island (IX.3). Another diplomatic initiative had no more success than the first, despite isolated attempts by a few Athenians to provide a favorable response (IX.4-5). Once more the Athenians had to send an embassy to Sparta to complain of its inaction and to let the Spartans know that their behavior would force the Athenians to reopen negotiations with Mardonius. At last, a Lacedaemonian army left the Peloponnesus commanded by the regent Pausanias (IX.6-11).

Persian strategy never ceases to amaze. Why did the Persians not attempt to profit from what would appear to be their position of strength, beginning in spring 479 (cf. VIII.113)? The contrast between a wait-and-see attitude and an offensive strategy is emphasized by Herodotus somewhat later. He introduces Artabazus and Mardonius: Artabazus suggests waiting quietly, distributing gold and riches among the Greek leaders: "Soon enough, they will surrender their freedom" (IX.41). Mardonius, on the other hand, being of "violent and headstrong character," counsels attack without further delay. But tactical and strategic debates regarding matters that did not become clear until several months later cannot be transferred, in retrospect, to the spring of 479. Nevertheless, it is clear that the description of Mardonius is highly suspect, given its systematic presentation of Mardonius in opposition to Artabazus (chap. 13/6 below).

The decision was actually made in Sardis. The king made his choice not only on the basis of European conditions but also on the basis of conditions in Asia Minor and the eastern Aegean. And the danger there was equally pressing, or at least could be considered so. Upon his return to Sardis, Xerxes had ordered his navy to winter in the waters of Cyme, with some ships spending the bad season at Samos. In spring 479, the whole navy was sent to Samos "to keep watch . . . upon the cities of the Ionians who were suspected of hostile sentiments" (Diodorus XI.27.1♦; cf. Herodotus IX.130). Xerxes and his advisers could have had no illusions about the restlessness of the Asia Minor Greeks. The appointment of tyrants, such as Theomestor at Samos (VIII.85), was not sufficient to ward off the danger. Xerxes must have been aware of the attempt to overthrow Strattis, the pro-Persian tyrant of Chios. The conspirators managed to escape and sought out the Spartans, in the name of the Ionians, "to ask them to deliver Asia." They then met with the leaders of the Greek navy at Aegina, commanded by the Spartan Leutichydes, to entreat them "to come land in Asia" (VIII.132). Herodotus then states that the Chios delegation, not without difficulty, persuaded the Greeks to sail as far as Delos. He says that

the Greeks did not dare to venture beyond Delos, nor the Persians beyond Samos, so that “their mutual fears stood sentry over the whole intervening area” (VIII.132♦). More likely, the Greeks could not leave Europe without forcing Mardonius’s hand, and Xerxes at Sardis found the situation sufficiently worrying that he kept his navy safe from the Ionians. Taking all this into account, the king decided to order Mardonius to make his overtures to Athens. But this was not a proposal to negotiate as equals: what was demanded of the Athenians was that they accept Persian dominion, a necessary condition for the recognition of their “autonomy.”

Plataea

After destroying whatever Athenian structures remained standing, Mardonius withdrew toward Thebes, “where he could fight in good cavalry country” (IX.13♦). He decided to set up an entrenched camp near the city (IX.15). The first engagements demonstrated the known superiority of the Persian cavalry (IX.19–23). Against the advice of Artabazus, Mardonius decided to commit to battle near Plataea, again relying on the cavalry; the battle was decisive (IX.49). Artabazus, observing the inevitable (or so it was later said to be) defeat, left the battlefield at the head of his divisions, “with the intention of reaching the Hellespont as quickly as possible” (IX.66). After the death of Mardonius, the Persian divisions took refuge in the entrenchment, which was soon seized by the Athenians and Lacedaemonians (IX.70). The Greeks captured Mardonius’s camp and Xerxes’ tent and were amazed by the tent’s riches (August 479). Meanwhile, Artabazus reached Abydos by forced march (IX.89–90). He must have arrived shortly after the Persians were defeated “again.”

The Asia Minor Front: Mycale

“It so happened that the Persians suffered a further defeat at Mycale in Ionia on the same day as their defeat at Plataea” (IX.90♦). While the synchronicity generally fits a well-known literary theme (cf. IX.100), this time it must correspond to reality, if not to the exact day. The victory at Plataea freed the Greek navy from the constraints that had previously kept it from leaving European waters. Meanwhile, the Greek commanders, who were at Delos, received messengers from Samos who—unknown to the tyrant Theomestor—communicated the following arguments:

that the mere sight of a Greek naval force would be enough to make the Ionians revolt, and that the Persians would offer no resistance to it—or if they did, they would provide the Greeks with as rich a prize as they were ever likely to get. (IX.90♦)

An alliance (*symmakhia*) was then formed between the Samians and the Greeks (IX.92), and the fleet cast off and dropped anchor off Samos (IX.96).

The speech Herodotus provides for the Samian envoys is curiously similar to the arguments offered twenty years earlier by Aristagoras of Miletus to Cleomenes of Sparta: “These foreigners have little taste for war . . . how easy they are to beat! Moreover, the inhabitants of that continent are richer than all the rest of the world put together” (V.49♦). True, Herodotus’s rationale leads him to describe what he calls the Second Ionian Revolt, which he places at the same time as the battle of Mycale (IX.104). It is hard to estimate the actual state of readiness of the Persian forces. Tigranes’ army, which Xerxes had ordered to guard Ionia (IX.96), had been reinforced with conscripts from Sardis and its environs (Diodorus XI.34). These must have been military colonists and

divisions that the Persians of the plain had to provide when required. The Persian commanders decided not to do battle at sea but to disembark their soldiers; united with Tigranes' troops, they hoped to win a land battle that they thought would be decisive. As soon as the Greek leaders arrived, they put pressure on the Ionians to join them. Their entreaties succeeded with some, as shown by the measures then taken by the Persians. The Samian contingent was disarmed (Herodotus IX.99, 103):

Next, the Persian command ordered the Milesians to guard the tracks which lead up to the heights of Mycale—ostensibly because the Milesians were familiar with that part of the country, but actually to get them well out of the way. Then, having taken these precautions against the Ionian troops who they thought might cause trouble if they got the chance, they proceeded to make their own dispositions. (IX.99♦)

But most of the Ionians waited cautiously. They knew that Xerxes had never left Sardis (Diodorus XI.35), and they were not unmindful that if the outcome was in favor of the Persians, the reprisals would be merciless. Nothing came of it. The Persians were beaten (mid-August 479), and the surviving divisions fell back to Sardis, close to Xerxes (IX.107; Diodorus XI.36).

The "Second Ionian Revolt"

"Thus this day saw the second Ionian revolt from Persian domination" (IX.104♦)—this is how Herodotus reflects, after describing the behavior of the Ionian divisions during the battle. Instigated by the Samians, "the other Ionians . . . defected as well and attacked the Persians" (IX.103). The Milesians took advantage of the position assigned to them by the Persians before the battle to lead the survivors toward the Greek camp: "and finally joined in the slaughter and proved their bitterest enemies" (IX.104♦). After the battle, a reunion took place at Samos. The Lacedaemonians, hoping to return to the Peloponnesus as soon as possible (IX.114), advised the Ionians to choose exile, since they would be unable to resist the inevitable Persian counterattack. The Athenians objected to this strategy, and their arguments won out:

Thus they brought into the confederacy (*symmakhia*) the Samians, Chians, Lesbians, and other island peoples who had fought for Greece against the foreigner; oaths were sworn, and all these communities bound themselves to be loyal to the common cause. This done, the fleet sailed for the Hellespont with the purpose of destroying the bridges, which, it was supposed, were still in position across the strait. (IX.106♦)

Thus was born what was to become the Delian League, but which at that date was no more than an extension of the Hellenic League established in 481 at Corinth after the news of Xerxes' arrival. Few cities in Asia Minor joined at that time, and then only the cities that were on islands, secure in their locations and with their navies. Other islands participated as well; they must have been added to the Greek alliance during the voyage between Delos and Samos somewhat earlier (cf. IX.101).

Xerxes from Sardis to Babylon

We can see that the events have been reconstructed almost exclusively from the Greek point of view. We have no precise or unbiased information on the actions and reactions of Xerxes. After discussing the guilty passions of the Great King and his sister-in-law, Herodotus leaves it at this: "He left Sardis for Susa" (IX.108♦). Diodorus in turn writes: "And when Xerxes learned of both the defeat in Plataea and the rout of his own troops in Mycalê, he left a portion of his armament in Sardis to carry on the war against the Greeks, while he himself, in bewilderment, set out with the rest of his army on the

way to Ecbatana" (XI.36↔). Had Xerxes thus chosen, "one more time," to flee the theater of operations and seek repose in his harem and among his architects? Or, when did he leave Sardis, and why?

It is clear that the presentations by the ancient authors are shaped primarily by polemical impulses. In reality, Xerxes did not return to the heart of his Empire as soon as he came back from Attica. Between his return from Salamis and his march toward Babylon, in fact, he undertook the fortification of the acropolis of Celaenae and built a residence there (Xenophon, *Anab.* I.2.9)—proof that he had not left Sardis in a fit of panic. Actually, as we shall see, after Mycale the Great King remained at Sardis. We learn from Ctesias (§27) that shortly afterward he sent a detachment of troops to waste the sanctuary of Didyma, a very famous sanctuary connected with Miletus. It is clear that by doing so Xerxes was mounting a counterattack against the rebellious Ionians, specifically the Milesians, after their treachery in the battle of Mycale (Pausanias VIII.46.3). We also know that the Branchidae, the sanctuary administrators, sought refuge with him: they had openly supported the Persians, and they feared reprisals from their fellow citizens. Ctesias says that Xerxes intended to reach Babylon. The reason for Xerxes' choice of this option must be sought in the situation prevailing at that time in that region. There are Babylonian tablets that indicate that a new revolt was under way, led by a man named Šamaš-eriba, who assumed the titles "king of Babylon, King of the Lands." It is highly likely that these events should be dated to 479, specifically August–September 479. At the very moment that he was trying to put down the Ionian revolt, the Great King received a message at Sardis informing him of the Babylonian insurrection.

So once again he was caught between two fronts. After the conference at Samos, the Greek navy had sailed toward the Straits, seizing Sestos, before returning to Greece in advance of the beginning of the chilly season (September 479: Herodotus IX.114–21). Given the choice of Ionia or Babylon, the king opted for the latter, surely because of the central importance it held in the imperial structure. The offensive was led by Megabyzus, who took the city (October 479). But even so, Xerxes did not abandon the Asia Minor front but left well-trained troops there.

5. The Persian Defeat: Its Causes and Consequences

Some Questions

We have seen how from the perspective of the Greeks, and of a large number of modern-day historians, 479 was a crucial year in the course of Achaemenid history (chap. 13/1 above). We have also stressed the distortions introduced in the old analyses. However, our ideological decoding of the Greek sources must not take the place of proof, since—once we eliminate the spectre of "decadence"—even the most biased texts can communicate some measure of reality. It thus fitting that we return to a series of questions as easy to formulate as they are hard to answer. How can the Persian defeat be explained? What were the magnitude and consequences of the defeat? How is Xerxes' position around 479 to be evaluated? We will stress beforehand that the state of the evidence permits at the most a few remarks and interpretive hypotheses, all (or nearly all) marked by a more-or-less high degree of uncertainty.

Arms and Tactics

At the risk of stating the obvious, the Persian defeats immediately reveal their military and tactical inferiority, at least at that point in time. It is unfortunately not easy to state

the reasons for this, because the fragmentary and contradictory state of the ancient sources makes it especially difficult to reconstruct Persian tactics in detail, including those employed at the most important land battle, Plataea.

First of all, it seems clear that the Persians placed unlimited confidence in their cavalry. With their swift steeds—swifter than the best of the Greek mounts (the Thessalian horses), says Herodotus (VII.196)—the horsemen were in a position to harry the enemy army, as at Plataea. A detachment encircled the Phocian division:

The Persian cavalry surrounded the unfortunate men, and began to close in with weapons ready poised, to make an end of them. A few spears were actually let fly; but the Phocians stood firm, drawing close together and packing their ranks tight. (IX.18♦)

A contingent of Megarians, who were fighting with the Phocians, were unable to cope and soon had to ask to be relieved of the post to which they had been assigned (IX.20). The cavalry was armed with spears and bows (IX.49; cf. Xenophon, *Anab.* I.8.3). They attacked by squadron (IX.22) and hurled spears and shot arrows, avoiding hand-to-hand combat (IX.49, 52). They did not charge, properly speaking, which would have been impossible without stirrups anyway, but continuously harassed (IX.57). The form of combat described by Herodotus reminds us somewhat of the tactics of the Sakan cavalry, against which Alexander's generals suffered extreme difficulties in Central Asia. The Saka, true mounted archers, showered the Greco-Macedonian infantrymen with arrows, panicking them by encircling them, howling and spewing shafts, then rapidly breaking off the combat only to return over and over (e.g., Arrian IV.5.4–9). The Sakan cavalry also distinguished themselves at Plataea (IX.71).

Not only was the Persian cavalry extremely mobile, it was just as securely armored. Here, for example, is how Xenophon describes Cyrus the Younger's Persian cavalry:

In the centre Cyrus and his horsemen. . . . These troopers were armed with breastplates and thigh-pieces and all of them except Cyrus, with helmets—Cyrus, however, went into the battle with his head unprotected—and all their horses had frontlets and breast-pieces. . . . (*Anab.* I.8.6♦)

Herodotus describes the rich breastplate worn by the Persian Masistiis, who was brought down by the Greeks at Plataea. They tried to kill him, but “the reason why they could not kill him at once was the armour he wore—a corslet of golden scales under his scarlet tunic. No blow upon the corslet had any effect . . .” (IX.22♦). A Babylonian document dated to Darius II adds some interesting details later: each horseman summoned to the king's review had to be provided with an iron breastplate, a gorget(?), an armored head-dress, a nape-cover, a copper shield, and 120 arrows (UC 9/3).

But the use of such a force involved, or could involve, a number of disadvantages. First of all, it placed a spatial constraint on the leadership: the force could only maneuver on wide, nearly level plains. Herodotus says that Miltiades advised Datis to land at Marathon in 490 because he thought (rightly or wrongly) that “the part of Attic territory nearest Eretria—and also the best ground for cavalry to manoeuvre in—was at Marathon” (VI.102♦). Mardonius left Attica because “it was bad country for cavalry” (IX.13♦). The Megarians suffered a thousand dead during the engagements prior to the battle at Plataea because “it so happened that the point in the Greek line which was most open and vulnerable to a cavalry charge was held by the Megarians” (IX.21). But it seems quite likely that the Greeks knew exactly how to choose a location that would ren-

der many of Mardonius's divisions impotent (Diodorus XI.30.6). Much later, Arrian wrote that the Persian defeat at Issus could be explained by the poor choice of ground, which was not appropriate for deploying the cavalry and Darius III's many divisions (II.6.3; II.6.6). It was quite different at Gaugamela, "an empty plain, suitable for cavalry. . . . If there was any eminence in the plains, [Darius] gave orders that it should be levelled and the whole rising made flat" (Quintus Curtius IV.9.10♦; Arrian III.8.7).

Furthermore, this heavily armored cavalry was hard to set in motion, as explained by Xenophon, a technician well informed on military and equestrian matters and eyewitness to Cyrus the Younger's exploits:

In no instance did the barbarians encamp at a distance of less than sixty stadia [ca. 11 km] from the Greek camp, out of fear that the Greeks might attack them during the night. For a Persian army at night is a sorry thing. Their horses are tethered, and usually hobbled also to prevent their running away if they get loose from the tether, and hence in case of any alarm a Persian has to put saddle-cloth and bridle on his horse, and then has also to put on his own breastplate and mount his horse—and all these things are difficult at night and in the midst of confusion. (*Anab.* III.4.34–35♦)

The *jambeaus*, pieces of scaled armor for both rider and mount protecting both the horse's chest and the man's legs, were especially dangerous. The moment a horse was wounded or panicked, the rider was thrown and often was wounded by the *jambeau*. On the ground, a Persian cavalryman was as good as dead (Herodotus IX.22). We may add that, in order to achieve some degree of effectiveness, the cavalry had to move with rigid discipline. The death of the leader of a division left the horsemen on their own, as we can see from the description of Masistius's death: "They missed him—for there was no one to give the commands." Instead of charging by squadron (*kata telea*), the entire force rode in again in a mass attack (IX.22♦). Consequently, the Persians were unable to retrieve Masistius's body (IX.23).

What is most striking is that the Persian leaders were unable or unwilling to conceive of tactics that would closely unite the cavalry and infantry, other than in spur-of-the-moment engagements that were not really coordinated (IX.23). It appears that the cavalry was never able to disrupt the compact mass of Greek infantry (IX.60–61). At Plataea, Mardonius on horseback led his infantry on the double, but he was soon followed by other detachments that swept forward in the utmost disorder, "without any attempt to maintain formation . . . a yelling rabble, never doubting that they would make short work of the fugitives" (IX.59♦). The Persians' favorite tactic was to set up a sort of wall consisting of their shields rammed into the ground; with this protection, they let fly arrows and spears at the intimidated attacker (IX.61, 100). But as Pausanias reminds us (IX.46), the Greeks had had the experience of Marathon, "where they were, as far as we know, the first to advance toward the enemy at a run . . ." (VI.112). As soon as the Greek hoplites carried off this maneuver, the rampart of shields was quickly breached. Forced to unstring their bows, the Persian infantrymen no longer measured up, as at Plataea (IX.62) and Mycale (IX.102). On this point, Herodotus's analysis is unambiguous:

In courage and strength [the Persian infantry] were as good as their adversaries, but they were deficient in armour, untrained, and greatly inferior in skill. Sometimes singly, sometimes in groups of ten men—perhaps fewer, perhaps more—they fell upon the Spartan line and were cut down. . . . The chief cause of their discomfiture was their inadequate equipment: not properly armed themselves, they were matched against heavily armed infantry. (IX.62–63♦)

Similarly, in his tale of the battle of Mycale, Herodotus stresses the Persians' courage, but he clearly shows at the same time that the moment the rampart of shields was downed, they had nothing but their courage with which to oppose the well-oiled machine of the phalanx (IX.102). Indeed, in both battles, and contrary no doubt to Persian expectations, the infantry won the day (cf. IX.28–31). At the end of the battle of Plataea, for example, Mardonius's cavalry was nearly intact (IX.69). Once they were repelled, the troops of Mardonius (who was now dead) were reduced to seeking refuge behind the palisade their leader had built for this purpose before the battle (IX.15). However, they were soon dislodged by the Athenians, "who knew [how] to attack the fortifications" (IX.70).

The Persians and the Others

Herodotus stresses the courage of the Persians several times. At Mycale, after their rampart of shields collapsed, "the enemy made no further serious resistance; all of them turned and fled, except only the native Persian troops" (IX.102♦). At Plataea, Mardonius was surrounded by an elite Persian corps, who mounted an unflinching resistance (IX.62). Herodotus opines as follows, stating that the Persians' allies (i.e., the other ethnic contingents) had not fought spiritedly, and he adds regarding Plataea:

It is perfectly obvious that everything depended on the Persians: the rest of Mardonius' army took to their heels simply because they saw the Persians in retreat, and before they had even come to grips with the enemy. (IX.68♦)

This analysis probably goes too far. Herodotus certainly sometimes uses the word "Persian" in an extended sense. For instance, according to him, all the navy crew were Persians, Medes, and Sakians (VII.96, 184). He also states regarding the battle of Plataea: "Of the enemy's infantry, the Persian contingent fought best; of the cavalry, the Sacae" (IX.71♦). It is undeniable that every commander depended primarily on the Persian contingent. Opposite the Lacedaemonian contingent, certainly the most warlike by reputation (IX.58), Mardonius placed the Persian infantry (carefully distinguished from the Medes) and within this group, "the best of them" (IX.31♦). It was at their head that he led them in the offensive (IX.59).

Should we infer that this difference in attitude also reflects political motives? We might *a priori* imagine that the Persians fought with great resilience because they were defending the interests of their own people and their king (cf. Diodorus XI.35.4), interests that did not necessarily converge with those of the peoples drafted to fill out the army. We know the Greek authors' predilection for one particular image: contingents forced to march under the whip, opposing Greeks who were fighting for their liberty. But it is hard to be certain about any of these matters, however basic. The behavior of some of the Ionian contingents during the battle of Mycale, particularly after the Greek victory, seems to be too specific an example to be able to generalize from it about the behavior of other peoples. Even at Salamis, Herodotus had to recognize, there was a small minority of Greeks who longed to change sides (VIII.11) among those who fought in Xerxes' navy, but he focuses instead on those who fought valiantly under the eyes of Xerxes, from whom they expected and received rewards and benefits (VIII.85, 90). It is also true that the presence of perfectly loyal contingents of marines (Persians, Medes, Sakians) certainly contributed to maintaining discipline on the ships. However, Herodotus puts forward explanations on the tactical level, similar to what he stressed at Plataea: in Salamis Harbor, the barbarians fought in disorder, breaking ranks, in contrast to their Greek allies (VIII.86, 89).

The decisions of the general staff must be explained on purely military grounds. When Herodotus states that the Persians were "deficient in armour, untrained, and greatly inferior in skill" (IX.62♦), he cannot be referring to the Persians proper, whose education on the contrary prepared them to be distinguished horsemen (see chap. 8/3), accustomed to the sort of activities demanded of them in battle (cf. Aelian, *Anim.* III.2; XVI.25). We may make the same assumption about the infantry. It is also likely that, like the Persian generals in Cilicia at the end of the 460s (Diodorus XI.75.3) and Darius III before Gaugamela (Diodorus XVII.53.4, 55.1), Xerxes took care to drill his troops. It is also likely that many of the Sakers in Xerxes' army had not been drafted directly from Central Asia but came from the military colonies settled in Babylonia and elsewhere; their armament was thus matched to the Persians'. When Herodotus labels the marines Persians, Medes, and Sakers (VII.96, 184), this implies that they were armed the same and drilled together, which is less certain for some other marines of different origin (Egyptian) who are named in one of Herodotus's summaries (VIII.32).

This, then, was the disposition of the Achaemenid armies. At Marathon, the Persians and Sakers were placed at the center of Datis's formation; they were excellent fighters, but "the Athenians on one wing and the Plataeans on the other were both victorious," and thus were able to encircle the Persians and Sakers (VI.113♦). Unfortunately, we do not know which divisions were assigned to the wings. At Plataea, Mardonius had placed the Iranian contingents at the center: Sakers/Indians/Bactrians, then the Medes and Persians; the allies were placed on the flanks (Europeans on the left flank; the others on the right flank, including the Egyptian marines). As soon as the royal cavalry found it impossible to break the disciplined ranks of the phalanx and the infantry adopted the traditional tactic of the rampart of shields, the outcome of the battle was assured, especially when the disastrous effect of the loss of the leaders responsible for organizing the divisions' offense is taken into account (IX.22–23]).

Artabazus and Mardonius

Herodotus introduces a heated debate between Artabazus and Mardonius in 479. Artabazus, portrayed as one "of the small number of Persians whom Xerxes held in particular esteem," advised against battle; Mardonius invoked "the good old Persian way" — "to engage in battle" (IX.41♦)—in a (reconstructed) conversation reminiscent of the speeches attributed by Diodorus to the Persian satraps in 334 (XVII.18.2). Herodotus says Artabazus was "a man of some foresight."♦ Later on, he attributes Artabazus's defection in the heat of battle to jealousy (IX.66). The contrast between the two men in Herodotus seems too stereotyped to reflect reality, and the details are unavailable to us. Herodotus also says of Artabazus that he "was already a famous man in the Persian army and was further to increase his reputation after the battle of Plataea" (VIII.125♦). In fact, we know that he was soon awarded the satrapy of Dascylium (Thucydides I.129.1). He certainly did come to Sardis to criticize Mardonius to Xerxes. This, paradoxically, is why the defeat at Plataea earned him a promotion within the king's entourage.

But even though Artabazus' career seems to indicate that Mardonius was no longer fondly remembered by the Persians (cf. VIII.99), this does not mean that the strategy advocated by Artabazus was the best one to adopt in 479, unless we follow the *post eventum* reasoning conveniently followed by Herodotus. Could the Persians have waited even longer, possibly spending another winter in Europe, just as the Greek navy was beginning to get under way in the Aegean? Commander-in-chief Mardonius probably had

received orders from Xerxes in the meantime. Given these circumstances, it seems difficult to follow Herodotus (and other ancient authors) when he assigns sole responsibility for the defeat at Plataea to Mardonius. It is likely that any Persian general in the same situation would have made the same tactical decision, quite simply because this decision corresponded to requirements relating to the armaments and the combat style of the royal army. The Persians were accustomed to gaining victories because of their cavalry, which had nearly always provided them superiority in their fights against the Greeks in Asia Minor. The Persian commander in 479 made two errors: first, he did not make the best use of his cavalry (which even seems not to have participated at Marathon and Mycale); second, he seems not to have understood that this adversary was quite different. Obviously, the Persians, despite their experience at Marathon, did not realize the effects of the hoplite revolution in Greece—or at least they had not drawn the necessary conclusions. But how could they?

The Consequences of the Defeats: Persian Losses

The magnitude of Persian losses, which if true would have caused lasting weakness in the military sphere of the Empire, is frequently stressed among the consequences of the defeats. But we have no credible evidence whatsoever that allows us to estimate with any probability the number killed. It seems to us that the impression of massive losses basically comes from Aeschylus, who states several times that the entire youth of Persia was lost (chap. 13/1 above). We have very little information beyond the deaths of nobles and leaders, who are listed by Aeschylus after the defeat at Salamis. But this list is not confirmed by Herodotus (*Persians* 303–30; Herodotus VIII.89♦), who simply writes, “Amongst the killed in this struggle was Ariabignes, the son of Darius and Xerxes’ brother, and many other well-known men from Persia, Media, and the confederate nations.” Masistius and Mardonius died at Plataea (IX.22–23, 64); two of the four commanders at Mycale, Mardontes and Tigranes, were killed (IX.102–3); Herodotus notes the death of two half-brothers of Xerxes, Abrocomas and Hyperanthes, at Thermopylae (VII.224). There is no doubt that many other names could be added to these selective lists (cf. Plutarch, *Them.* 14.3–4, *Arist.* 9.1–2, etc.). But these losses were not in any way decisive: the Persian people continued to thrive, and the nation was perfectly able to replenish the population in the normal way.

The Consequences of the Defeats: Territorial Setbacks

When we consider territory, the outcome is different. If we compare the situation after Mycale to the territory governed by the Persians at the time of the death of Darius, the most important losses are in the Aegean, where the naval defeats left the field free for the Greeks. Probably even before Mycale, most of the islands conquered in 490 had left the Persian side. We must also note, however, that when Xerxes left Sardis, and even at the end of 479, the losses in Asia Minor proper were minimal. What Herodotus calls the Second Ionian Revolt is negligible alongside the First; this time, the mainland cities remained under Persian control. On the other hand, and contrary to the interpretation that might be derived from the silence of the Greek sources, Xerxes did continue to take an interest in the western front. Before leaving Sardis, he took military and strategic measures, according to Diodorus—who unfortunately does not provide the details (XI.36.7).

Obviously, the breadth of the defeats and setbacks must not be underestimated, nor should we underestimate the errors made by Xerxes and his advisers. However, we

would like to stress at this point that, in 479, the book was not yet closed. No one knew, at that time, that the Athenians would launch a vast offensive between 470 and 460—or at least it is doubtful that the Persians had any awareness of it then. They were certainly aware that the Spartans had resolved not to remain in Asia Minor, since despite their Greek experiences in 490 and 480–479, the Persians were well enough situated to know that the Spartans were reluctant to leave their Peloponnesian domain. Even in the Peloponnesus, Xerxes had the active friendship of the people of Argos (VII.151; IX.12). In other words, there is no reason to say that by leaving Sardis Xerxes had reached a turning point regarding the western front or that he had decided to dedicate himself exclusively to matters in the heartland. And at any rate, in the strategic thinking of the Great King, where would the periphery have begun?

The Consequences of the Defeats: The Great King's Prestige

The fact remains that during the summer of 479, the Great King had just suffered three defeats in a row and that he had to leave the Asia Minor front to put down a new revolt in Babylonia. We do not know the exact causes of the revolt. But we may suppose that the Persian defeats were a trigger, an event from which the Babylonians tried to profit. In the same way, the "Second Ionian Revolt" was a logical consequence of the Greek victories. These revolts, following the revolt in Egypt in 486, remind us of the fragility of the Achaemenid imperial structure, while at the same time the reconquests illustrate the resilience of the Persian machinery, in particular the military superiority of the Persians compared with their Near Eastern neighbors.

But did the defeats also weaken the Great King in the eyes of the aristocracy and the Faithful? It is quite difficult to answer a question so delicate at this point, though the analyses below will flesh out a response. Two contrary approaches can be taken successively, neither of which, it must be recognized from the outset, can provide a fully satisfactory answer. We know the Greek response. The breadth of Xerxes' defeat was symbolized for the Greeks by certain items of booty, symbols of royal power, that fell into their hands. Most important were the royal tent and Xerxes' footstool. In Herodotus's dramatic tale of Xerxes' retreat after Salamis, he also mentions that on the inbound journey Xerxes had left the sacred chariot of Zeus/Ahura-Mazda at Siris in Thrace (VIII.115), the very chariot that had held a place of honor in the official procession of the king when he left Sardis (VII.40). Herodotus adds that Xerxes was not able to retrieve it, "because the Paeonians had given it to the Thracians and, when Xerxes demanded it, pretended that the mares had been stolen at pasture by the up-country Thracians, who live near the source of the Strymon."♦ The entire passage about the retreat is highly suspect: it tries to show not only the Great King's distress but also the disloyalty of the subject peoples (cf. VIII.116). Nonetheless, there is no reason to doubt the truth of the episode of the chariot. Indeed, as we have seen (chap. 6/3), the chariot was a striking manifestation of the sacred character of Achaemenid royalty and its privileged relationship with Ahura-Mazda. To an extent, Xerxes' situation was comparable to Darius III's (seen through Macedonian propaganda) who, after Issus and Gaugamela, abandoned the insignia of his power on the spot. But, however evocative the episode was in Greek eyes, is it likely that it discredited the Great King in Persian eyes?

Undoubtedly, royal propaganda denied the defeats. The list of countries in the *daivā* inscription (XPh §3), though it undoubtedly dates to a later period, includes (as if

nothing had happened) the Ionians living near the sea, the Ionians living beyond the sea, and the inhabitants of Skudra. It was certainly the same in 480–479. The tenor of the letter sent to Mardonius (VIII.140) in fact implies that in Xerxes' eyes the devastation on the Acropolis and the spoils he had carried off from there were significant symbolic and political markers of the success of his expedition (cf. VIII.55). It may have been when he returned to Sardis that he deposited a bronze statuette the Persians had captured at Athens in the sanctuary of the Mother of the Gods (Plutarch, *Them.* 31.1). This righted the wrong committed against the sanctuary of Sardis twenty years earlier by the rebellious Ionians (cf. V.102). The official Persian version of the events is probably close to what Dio Chrysostom reports much later (XI.149):

During his expedition in Greece, Xerxes achieved victory over the Lacedaemonians at Thermopylae and killed King Leonidas there. Then he took and laid waste to Athens, of which he sold into slavery all the inhabitants who had not succeeded in escaping; and after these successes, he imposed tribute (*phoroi*) on the Greeks and returned to Asia.

This appears to be a biased report but, as is easy enough to understand, it is entirely possible that the king had ordered that the story be spread among the High Country peoples (*ta anō ethnē*) in such a way that they would not incite unrest. Xerxes also states in the *daivā* inscription that, like the other peoples reputed to have submitted, the Ionians brought him their *bāji* 'tribute/gift'.

Like Aeschylus, Herodotus describes the despair of the Persians at Susa when they learned of the defeat at Plataea. He contrasts it to their rejoicing at the news of the capture of Athens: "They strewed the roads with myrtle-boughs, burned incense, and gave themselves up to every sort of pleasure and merrymaking" (VIII.98♦). The festival described here corresponds in all its details with the order of the royal procession when the Great King solemnly entered his residences or when he was greeted by his peoples and cities. Everything leads us to believe that, upon his return, bearing spoils and booty taken from Greece, Xerxes again appeared in triumph. He deposited the booty in the various capitals of his realm, as conspicuous signs of his "victory" (cf. Arrian III.16.7–8; VII.19.2; Pausanias I.8.5, 16.3; VIII.46.3).

Of course, royal proclamations do not constitute a fully satisfactory answer, either, since they present an image of the Empire as the Great Kings wanted it to be, not necessarily as it was. Nonetheless, they have the undeniable advantage of introducing us to the Persian presentation of events in contrast to the meaning these events had for the Greeks. Note, too, that this was not the first time the Great King had suffered a military reversal. Cyrus had died on an expedition in Central Asia, and Darius had returned from the Ukrainian steppes without conquering the Scythians. Moreover, there is no evidence of the slightest hint of disloyalty on the part of leaders or soldiers. The generals were always quite anxious to serve the King's House and just as anxious to avoid royal ire after a defeat (IX.107). The only known "revolt," that of Masistes (IX.113), appears in a context that is too suspect to be used as a criterion. It is obviously out of the question to suppose, as do Justin (III.1.1) and Aelian (VH XIII.3), that the assassination of Xerxes thirteen years later was the outcome of a loss of prestige due to the defeats of 480 and 479. In short, in 479, the undeniable military defeats and initial territorial losses were, in the Persians' eyes, neither overwhelming nor conclusive. We have every right to think that, on the contrary, they were ready to go to war anew.

6. Xerxes and His Peoples

A Problem of Method

Also generally attributed to the first years of Xerxes is a sudden and radical transformation of royal policy toward conquered lands. The dominant theory may be presented as follows. The decrees attributed to Xerxes in Egypt and Babylonia after their rebellions had several intentions: to abandon the traditional titles of pharaoh and king of Babylon that his predecessors had borne; to destroy their temples and sanctuaries; and to transform countries that until then had retained their own pre-Achaemenid structures into thorough-going satrapies. For Babylonia, these conclusions are extracted from Classical texts and from Babylonian tablets; for Egypt, from a passage in Herodotus, from hieroglyphic inscriptions . . . and from the (supposed) silence of the sources.

This interpretation is also based on a famous inscription of Xerxes, recovered in several exemplars in several languages (Persian, Akkadian, Elamite) at Persepolis and Pasargadae (XPh). In this inscription, the Great King states on the one hand that he had brought order back to a country in which turmoil had spread after his accession; on the other hand, he writes that he had destroyed the sanctuaries of the *daivā*, a word understood in general as 'demons' or 'false gods'. It is most often inferred that this country was none other than Babylonia—even though some authors have considered Bactria, Media, Egypt, and even Athens. The various sources are deemed to complement each other and to give Xerxes the image of an intolerant king who made a violent break with Achaemenid ideological strategy by obstinately warring against the sanctuaries of the subject peoples, instead of respecting them as his predecessors had.

So we see that the texts and arguments have been mechanically jumbled together to produce a coherent picture that—moreover—corresponds with the view that the Greek authors wished to impose (cf. chap. 13/1)—not, incidentally, a point in its favor. This methodological point is the focus of our criticism. The coherence of the body of evidence must not in fact be the basis for postulation or preconception. If such coherence exists, it must emerge from distinct, and thus regional, analyses of the various assemblages. We shall thus begin with a careful examination of the Babylonian and Egyptian examples and add to them the Greek example. Only after this first stage can we arrive at an interpretation of the statements by Xerxes.

Xerxes and Babylonia: The Babylonian Materials

Let us first open the Babylonian file, stating at the outset that it is a good idea to separate the information transmitted by the Greek sources from the data in the tablets. Three conclusions have long been drawn from the tablets: the Great King abandoned the Babylonian royal titles, he stopped presiding over the New Year festival, and he separated Babylonia from Trans-Euphrates and made them both distinct entities. Finally, the scarcity of Babylonian tablets from the time of Xerxes and later and the apparently sudden break in certain private archives are attributed to all sorts of upheavals caused by the king in Babylonia.

Yet not one of these arguments holds water. The retention of the traditional titles is now certain for the time of Xerxes, and the title King of Babylon is even attested in the 24th year of Artaxerxes I (441). It is also true that the titulature of Xerxes exhibits adaptation, but there is no reason to relate it directly to the Babylonian revolts (chap. 13/7 below). As for the New Year's rite, the supposed abstention of Xerxes signifies nothing,

since the participation of his predecessors is not recorded either. There remains the third argument, based on the disappearance of the district of Babylonia and Trans-Euphrates in the time of Xerxes as a consequence of the revolt. However, this is an interpretation, not a commentary on specific tablets. One recently published tablet witnesses to the existence of the title and the position "Governor of Babylon and Ebir Nāri" in October 486, two months before the death of Darius, 25 years after the mention that had long been thought to be the latest (BM 74554). Indeed, the extant documentation does not rule out an administrative change in Xerxes' time, nor does it support it any longer. When we recognize the transitory character of our knowledge of Babylon due to the changing and unforeseeable state of the cuneiform documentation, any conclusion of this sort is suspect, since it clearly proceeds from a preconception about the behavior of Xerxes: the supposed link between the Babylonian revolt and the creation of a separate satrapy (which might, with just as much "verisimilitude," be interpreted in exactly the opposite way). Finally, the state of the documentation also reminds us not to link political inferences mechanically to the number of tablets, reign by reign. The case of Kish alone is convincing: at this site the number of tablets *currently* dated to Xerxes' reign (21) is nearly twice the number coming from Cyrus and Cambyses combined (11) and somewhat lower than the number of tablets from Darius (30). Moreover, recent publications continue to increase the Babylonian corpus from the time of Xerxes.

Xerxes and Babylonia: The Greek Materials

As has been mentioned, the revolt that forced Xerxes to leave Sardis during the summer of 479 was led by Šamaš-eriba, who between August and October bore the traditional titulary ("King of Babylon, King of the Lands"). Only Ctesias gives the story of the events themselves, and it is briefly summarized by Photius. Megabyzus son of Zopyrus was at Sardis with Xerxes, and he was entrusted with putting down the rebels; this feat earned him considerable royal rewards (Ctesias §22). Xerxes' depredations in the Babylonian sanctuaries are presented as follows by Herodotus. In his depiction of Babylon, he describes the sanctuary of Zeus, whom we must understand to be Mardūk; he states that there was a large gold statue (*agalma*) there of the seated god; there were also a table, a throne, and a footstool of gold, and outside the temple two altars (one gold) on which sacrifices were offered by the Chaldeans. He ends:

In the time of Cyrus there was also in this sacred building a solid golden statue of a man (*andrias*) some fifteen feet high—I have this on the authority of the Chaldaeans, though I never saw it myself. Darius the son of Hystaspes had designs upon it, but he never carried it off because his courage failed him; Xerxes, however, did take it and killed the priest who tried to prevent the sacrilege. (I.183♦)

Contrary to what is frequently stated, Herodotus's text does not allow the conclusion that Xerxes deported the statue (*agalma*) of Mardūk to Susa; in his time, this statue was still in the temple. Did Xerxes steal the other statue (human, not divine: *andrias*), which was located outside the sanctuary proper? This is possible, but we cannot conclude this on the evidence of Herodotus alone. In fact, it is clear that he got his information from representatives of the sanctuaries more than a generation after the alleged events. Let us add two remarks: the contrast between Darius and Xerxes is repeated by Herodotus himself in the case of Egypt (VII.7), and Darius's fear in the presence of a statue seems to reflect a popular theme, since it is found again in Herodotus (II.110) and Diodorus of Sicily (I.58.4), both referring to relations between Darius and the priests of the sanctuaries of

Ptah at Memphis. In other words, Herodotus's text is built on a series of motifs that hardly convince the commentator to accept it at face value.

Xerxes' sacrileges are especially developed by the Hellenistic authors, who got their material from Alexander's historians. They all contrast the Macedonian's behavior with the Great King's: Strabo (XVI.1.5) and Diodorus (XVII.112.3) mention the destruction of the tomb of Belus but do not date it precisely. Arrian is more explicit: after describing the king's entry into Babylon, where he is greeted by, among others, the priests (III.16.3; Quintus Curtius V.1.22), he writes:

On entering Babylon Alexander directed the Babylonians to rebuild the temples Xerxes destroyed, and especially the temple of Baal, whom the Babylonians honor more than any other god. . . . At Babylon too he met the Chaldaeans, and carried out all their recommendations on the Babylonian temples, and in particular sacrificed to Baal, according to their instructions. (III.16.4-5♦)

He reverts to the subject during Alexander's second stay in the city (324-323). He recalls that Xerxes "had destroyed Babylonian sanctuaries," including that of Belus, dating these destructions to Xerxes' return from Europe—that is, 479 (VII.17.1-3).

There is no need to argue about the propagandistic character of the Hellenistic texts; the contrast emphasized between Alexander and Xerxes could only enhance the piety of a king who later on would also allow the Greeks to retrieve "all the statues or images or other votive offerings Xerxes removed from Greece" (VII.19.2♦). For Arrian, as for many other Greek authors, Xerxes is pictured as a destroyer of sanctuaries and a king overcome by excesses, just as Cambyses was, for that matter (cf. Arrian IV.11.6; VII.14.6). In fact, by entering Babylon, Alexander was doing nothing more than repeating the attitudes and decisions of any conqueror, condemning the memory of his predecessors and demonstrating his piety toward the gods of the "liberated" population. This is precisely what Cyrus had done in 539 on the same spot (cf. chaps. 1/5, 18/3). It was no less usual for a king to claim to have restored structures that had fallen into ruin (e.g., *DSe* 001). It was said that Alexander "had it in mind to rebuild it [the temple of Belus], some say on the original foundations . . . others say that he wished to make it even larger than the old one" (Arrian VII.17.2♦). In other words, although it can easily be suggested that Alexander took action on behalf of the Babylonian temples, nothing shows that their "destruction" was due to Xerxes.

And even if we admit that the Classical texts are not simply bearers of false propaganda spread later by the representatives of the temples, it goes too far to state that Xerxes entirely destroyed the sanctuaries, since their subsequent vitality is well attested right through the Hellenistic period. Taking reprisals against the sanctuaries of a rebellious country was a general custom that cannot be considered specific to either Xerxes or the Achaemenids. Xerxes demonstrated his power in this way only at Athens and Didyma. Such decisions—whose ins and outs have already been explained—do not at all prejudice the king's religious sentiments; still less do they imply that Xerxes had decided to persecute Babylonian religion.

Xerxes and Egypt

The theory that an "identical" policy was carried out in Egypt is primarily founded on the gaps in a narrative documentary record that, to be quite strict, is based on nothing more than an imprecise sentence in Herodotus. He simply writes that, after reconquering the Nile Valley, and "having reduced the country to a condition of worse servitude

[*pollon douloterēn*] than it had ever been in in the previous reign, [Xerxes] turned it over to his brother Achaemenes," the son of Darius (VII.7♦). From Herodotus's point of view, the expression is indisputably condemnatory. We may also note that he had already introduced the contrast between Darius's behavior and his son's at Babylon (I.183). But he is silent on the measures actually taken by the son. Should we infer from this, as is usually done, that beginning with Xerxes the Egyptian policy was radically altered, with the king harshly punishing the Egyptian sanctuaries, abandoning the pharaonic titulary, and removing Egyptians from positions within the administration? In short, was Xerxes transforming Egypt into a satrapy after it (according to this hypothesis) had remained an autonomous region under Cambyses and Darius?

A preliminary remark: if the theory discussed here has awakened any echoes, it is in part because argument *e silentio* (or supposed silence) has been used *ad nauseam*, and it is especially because an interpretation formed on the basis of a study (a faulty study; see above) of the Babylonian materials has been plastered onto Egypt. We will not insist on this last observation, even though it leaps out at the wary observer. As for the silence of the sources, this is an argument born of desperation, whose vanity (we may even say, the danger) has just been illustrated in the Babylonian example. It is true that, apparently, no temple construction is attested in Egypt after the work done by Darius. But what are we to conclude from this? Should we not cautiously wait for the evidence to take on some degree of comparability? We may mention, for example, that a bronze carrying handle has been found with an inscription in the name of Xerxes (in Persian: 'Xerxes the king, *vazraka*'); according to the author who published the piece, "this carrying pole . . . would thus have served to bring a *naos* or some other portion of the sacred equipment offered by Xerxes to an Egyptian temple." Of course, the object is tiny and the interpretation susceptible to revision. But if we consider the example of Karnak, Darius's building activity is attested there only by a few modest bits of evidence, the latest of which was only discovered recently. If we add to this the fact that in year 1(?) of Xerxes a Demotic document (also recently published) provides evidence of the existence of an official ceremony of burial of the mother of an Apis, we see how certain historical inferences have been drawn from nothing more than a simple statistical illusion.

In any event, the evidence is not absent! But the potency of the supposed Babylonian parallel and the picture of Xerxes previously drawn have led to the neglect of the actual evidence, or to biased interpretation. In actuality, no abandonment of the pharaonic titles is attested. Quite to the contrary, two groups of documents argue against such a theory. First are the hieroglyphic inscriptions from Wadi Hammamāt, which come from a Persian (and sometimes his brother), Atiyawahy, who held the post of governor of Coptos under Darius, Xerxes, and Artaxerxes. Between Darius and Xerxes, no major modifications of the titles are noticeable (cf. Posener nos. 24–25: 486 and 484). In 476 and 473 (nos. 27–28), Xerxes is called "Lord of the Double Country." In 474, Atiyawahy refers to Cambyses, Darius, and Xerxes as bearers of the title "Lord of the Double Country" (no. 28). The following year, the inscriptions name Darius and Xerxes together, with the same title: "Lord of the Double Country, son of Râ, master of the crowns, may he live forever" (no. 30). There is no essential difference in the picture given by the inscriptions on stone vases found at Susa and Persepolis (and elsewhere). There we find: "King of Upper and Lower Egypt, Lord of the Double Country, Xerxes, may he live forever" (nos. 43–48). Some, to be sure, say only "Xerxes, Great King" (nos. 49–76). But, given that

they are undated, a chronological-thematic division into two distinct groups to illustrate a change in royal policy must remain hypothetical, presently unverified. As in the case of Babylonia, gaps in the documentation must be considered in the case of Egypt; a recently published inscribed vase proves the existence of the title "Pharaoh the Great" under Artaxerxes I (A'Orsk).

Some changes are undeniable. Under Darius, for example, the vase inscriptions are in hieroglyphics only, but they are quadrilingual in the times of Xerxes and Artaxerxes. It is also true that Xerxes' title is less rich than what Udjahorresnet, for instance, acknowledges for Cambyses and then Darius. But this does not necessarily reflect a policy change; the cause is due to the source (Atiyawahy), the purpose of the object, and the identity of the recipient of the message (a stone vase is a very different sort of medium than an Egyptian's autobiographical inscription). In sum, the fact remains that the content and dating of the inscriptions currently known indubitably prove that the reconquest of Egypt was not followed by the sudden abandonment of the pharaonic titles.

It must be stressed, finally, that we have no truly trustworthy document that could serve as the basis for assessing Xerxes' behavior in respect to the Egyptian temples. The only text available for this purpose is the famous *Stela of the Satrap*. Dated to year 4 of Alexander IV, this hieroglyphic inscription exalts the virtues of the good pharaoh, whom the priests of the goddess Wajet of Buto identified with Ptolemy, then satrap of Egypt. The inscription reports that, at the end of an Asian campaign, a pharaoh brought back statues of gods and ritual objects, "as well as all the ritual paraphernalia and the books of all the temples of Northern and Southern Egypt, and returned them to their original place." He is especially praised for confirming and extending a land concession made to the sanctuary. The text reports that the (unnamed) pharaoh "expelled the profaner Xerxes from his palace with his eldest son."

Few documents have excited Egyptologists as much. The interpretations vary widely, and great uncertainty lingers, partly due to purely epigraphic and philological problems. Let us provisionally set aside all of the counterarguments and agree for the sake of argument that the inscription really is about Xerxes. At this point, it is enough to recall what was said earlier, on the basis of the Greek sources dealing with Xerxes' policy toward Babylon: if in either case, above and beyond the obvious apologetical prejudice in favor of Alexander and Ptolemy, respectively (borne by means of the same literary motifs and ideological clichés), they transmit any scrap of truth, this cannot come as a surprise. All that can be deduced from the text is that after the reconquest of Egypt the Great King retaliated against the Egyptian temples (assuming that the case reported here can be extended). Nothing further can be added.

Xerxes and the Greek Gods

By way of confirmation of Xerxes' religious policy during these years, it is useful to review his ritual practices during the Greek war. At the beginning, the king was accompanied not only by Persian *magi* but also by Greek diviners and specialists. Herodotus mentions that one of his advisers was the oracle-collector Onomacritus, who had been thrown out of Athens with the Pisistratids. To egg Xerxes on to war, Herodotus says, Onomacritus spoke oracles favorable to the future expedition (VII.6). The same was true for Mardonius, during the battle of Plataea: while the diviner Teisamenos officiated on the Greek side, Mardonius had with him the Aelian diviner Hegesistratus, whom he had

hired at great cost. He could also count on the services of another diviner, Hippomachus of Leucas, who was with his Greek allies. It was due to the urging of Hegesistratus “that he interrogated the future by offering sacrifices in the Greek fashion” (IX.37–38). We also know, again from Herodotus, about Mardonius’s care in consulting the Greek oracles (VIII.133–35). The practice was widespread, at least from the time of Croesus, including Cyrus and Darius.

Xerxes too made many sacrifices to the local gods. At Ilion, “he sacrificed a thousand oxen to the Trojan Athena,” while the *magi* made libations in honor of the heroes (VII.43). This clearly refers to the “Asiatic” heroes, Priam and his companions. In contrast, the *temenos* at Elaeus dedicated to Protesilaus, Greek hero of the Trojan War, was laid waste by Artayctes, governor of Sestos. Herodotus, referring twice to this person he despises for his damnable impiety and harshness, represents his deeds as driven by his personal zeal and claims that Xerxes was unaware of his trickery (VII.33; IX.115–16); but it seems more likely that the devastation of a *temenos* dedicated to a Greek hero reflects honoring the memory of Priam.

Throughout the expedition, the *magi* and Greek specialists performed sacrifices, each in his own domain. But it is not always easy to determine whether Xerxes was addressing Iranian or Greek gods; for example, when he arrived at the Hellespont:

All that day the preparations for the crossing continued; and on the following day, while they waited for the sun which they wished to see as it rose, they burned all sorts of spices on the bridges and laid boughs of myrtle along the way. Then sunrise came, and Xerxes poured wine into the sea out of a golden goblet and, with his face turned toward the sun, prayed that no chance might prevent him from conquering Europe or turn him back before he reached its utmost limits. (VII.54♦)

Herodotus then states that Xerxes ritually threw several objects into the sea (the goblet, a bowl, and a Persian sword). These ritual acts presented Herodotus with several interpretive problems:

His prayer ended, he flung the cup into the Hellespont and with it a golden bowl and a Persian *acinaces*, or short sword. I cannot say for certain if he intended these things which he threw into the water to be an offering to the Sun-god; perhaps they were—or it may be that they were a gift to the Hellespont itself, to show he was sorry for having caused it to be lashed with whips. This ceremony over, the crossing began. (VII.54♦)

The reference to the Sun obviously refers to Persian worship (see chap. 6/6). But the episode cannot be reduced to this alone. This is probably what caused Herodotus’s dilemma. We can easily compare Xerxes’ deed with the sacrifices carried out by Alexander at the Indian Ocean near the mouth of the Indus:

Then he sacrificed bulls to Posidon, and cast them into the sea, and after the sacrifice poured a libation and cast into the sea the cup made of gold and golden bowls as thank-offerings, praying that Posidon would safely convoy the naval force he intended to dispatch with Nearchus towards the Persian Gulf. (Arrian, *Anab.* VI.19.5♦)

Aside from a few differences (bull/Dionysus), the texts correspond: the king makes a libation, then throws the ritual cup, accompanied by golden bowl(s), into the sea. Xerxes adds a Persian sword. Rather than thinking (as is sometimes done) that Xerxes was honoring Iranian water gods in this way, we are tempted to think that this refers to Greek sea gods. We also know from Herodotus (VII.191♦) that, in order to deflect a storm, the *magi* were not satisfied by “putting spells on the wind, [but] by further offerings to Thetis and

the sea-nymphs" — gods who for the Greeks were among the descendants of the Tide of the Sea (*Pontos*). The Wind himself was honored both by the Persians (I.131) and by the Greeks (cf. VII.13). It thus appears more likely that the Persian offerings were intended to procure the favor of Greek gods for Xerxes and his army; these gods had already exhibited their wrath by destroying the first bridges, which, according to Herodotus, had led to royal reprisals against the sea itself and against the engineers (VII.33–36). It was obviously to counteract this disturbing memory and to open for himself the gates of Darius III's Empire that Alexander "sacrific[ed] a bull to Posidon and the Nereids in the midst of the Hellespont strait, and pour[ed] into the sea a drink offering from a golden bowl" (Arrian I.11.6♦).

This was a common practice. Whenever a conqueror wanted to seize an enemy country, he needed to invoke the protection of the local gods to guarantee his future success. Alexander did not fail to do this, for example, before the battle of Issus (Quintus Curtius III.8.22). Datis, eager to placate the Apollo of Delos, did the same (Herodotus VI.97). Conversely, all who resisted or rebelled also had to be punished in the presence of their gods. This is why Didyma was destroyed after Mycale; it is also, of course, why the sanctuaries of the Acropolis were destroyed and the votive statues deported (VIII.52–54), deeds that cannot be reduced to the motif of revenge. Herodotus actually failed to grasp the political significance of one order that Xerxes gave:

He summoned to his presence the Athenian exiles who were serving with the Persian forces, and ordered them to go up into the Acropolis and offer sacrifice there according to Athenian usage; possibly some dream or other had suggested this course to him, or perhaps his conscience was uneasy for the burning of the temple. (VIII.54♦)

Actually, Xerxes' behavior was not illogical. After conquering Athens (taking civic sanctuaries), he installed his clients there; only by acknowledging the local gods could the Persians' client rulers have legitimate power. Herodotus repeated this pious tale: "When the Athenians, who were ordered by the king to offer the sacrifice, went up to that sacred place, they saw that a new shoot eighteen inches long had sprung from the stump [of the sacred olive tree]. They told the king of this" (VIII.55♦).

From Cyrus to Xerxes

In the final analysis, when marching against or alongside his peoples, Xerxes behaved no differently from his predecessors: he appealed to local religious specialists, sacrificed to local gods, destroyed sanctuaries in cities and countries that disturbed the imperial order. In no place — Babylonia, Egypt, or Greece — do the orders of the king that have survived (or those attributed to the king) reveal any sort of fundamental or insurmountable hostility toward the gods honored by the local peoples. Having come this far in the analysis, there is no longer any need to contrast Xerxes' methods of government with Darius's. Furthermore — let's get it out of the way now — the theory of a "satrapization" of Babylonia and Egypt comes from a mistaken understanding of the policy pursued successively by Cyrus, Cambyses, and Darius. By 486, neither Babylonia nor Egypt constituted a kingdom linked weakly by nothing more than a personal relationship with the Great King. However great its consequences, the changes made, especially no doubt in the time of Darius, had already adapted and transformed the political-administrative structures of these two countries, both of them having been turned into satrapies directly after conquest, one in the time of Cyrus (Babylonia), the other in the time of Cambyses (Egypt).

7. Xerxes, Ahura-Mazda, and Persia

The *daivā* Inscription: Study of the Content

Having clarified the debate, we may now approach a basic document, the famous *daivā* inscription (XPh). In the first part (§§ 1–2), Xerxes repeats practically word for word the introductory paragraphs of Darius's first inscription at Naqš-e Rostam (formulas of the creations by Ahura-Mazda, genealogy, titles). Then follows a list of 31 countries that were subject to him and brought him tribute (*bāji*) (the only country list among this king's inscriptions). Then come the paragraphs that have stimulated countless debates:

(§4a) Saith Xerxes the King: When that I became king, there is among these countries which are inscribed above (one which) was in commotion (*ayauda*). Afterwards Ahuramazda bore me aid; by the favor of Ahuramazda I smote that country and put it down in its place. (§4b) And among these countries there was (a place) where previously false gods (*daivā*) were worshiped. Afterwards, by the favor of Ahuramazda, I destroyed that sanctuary of the demons, and I made proclamation, "The demons (*daivā*) shall not be worshiped!" Where previously the demons were worshiped, there I worshiped Ahuramazda and Arta reverent(ly). (§4c) And there was other (business) that had been done ill; that I made good. That which I did, all I did by the favor of Ahuramazda. Ahuramazda bore me aid, until I completed the work. (§4d) Thou who (shalt be) hereafter, if thou shalt think, "Happy (*šiyāta*) may I be when living, and when dead may I be blessed (*artāvā*)," have respect for that law (*dāta*) which Ahuramazda has established; worship Ahuramazda and Arta reverent(ly). The man who has respect for that law which Ahuramazda has established, and worships Ahuramazda and Arta reverent(ly), he both becomes happy while living, and becomes blessed when dead. (§5) Saith Xerxes the King: This that I have done, all this was by the will of Ahuramazda. Ahuramazda brought me aid, until I finished the work. May Ahuramazda protect me from harm, and my royal house, and this land: this I pray of Ahuramazda; this may Ahuramazda give to me!✠

During the course of this statement, with many elements copied from DNa, Xerxes thus introduces a passage distinctly his own, in which he claims: (1) to have reestablished order in a troubled country; (2) to have destroyed the sanctuaries of the *daivā*; (3) to have reestablished the worship of Ahura-Mazda; and (4) to have reestablished order in another "business." And he adjures those who "will come hereafter" to follow his example in doing what will ensure happiness on earth and after death.

The text has posed numerous historical problems and continues to do so; the problems are made still more difficult by epigraphic and philological problems that remain controversial, in particular the meaning of the phrase *artācā brazmaniya*. Comparison with the fragmentary Babylonian and Elamite versions does not resolve this problem, since the number of lexical borrowings from Persian is much higher in them than in the inscriptions of Darius. Despite the fact that the discourse forms a whole, we must, at least initially, answer three questions: What historical circumstances does the royal statement fit into? What is the king referring to with the word *daivā*? What instruction and advice is the king giving to those he addresses? It would be better not to focus on the discussion of the first question at the outset, because its answer depends in large measure on the answers to the other two questions.

The King, Ahura-Mazda, Life, and Death

The first interesting point about Xerxes' proclamation is that it contains the only occurrence of the word *artāvā* in the Achaemenid inscriptions. The importance of the concept of *arta* for the Persians is well evidenced by three observations: (1) Herodotus

says, formerly "the Persians . . . were known to themselves and their neighbours as *Artai*" (VII.61♦); (2) Hesychius defines the word as "the heroes among the Persians"; (3) moreover, one of the courses of instruction given to young Persians was Truth.

What is noteworthy in the use of *artāvā*, which can also be understood as 'virtuous death', is that it expresses a belief in an afterlife whose course is determined by judgment of the person's behavior during his life on earth. "The message is as follows: whoever performs acceptable sacrifices to Ahura-Mazda can during his lifetime be assured of his fate after death, and upon dying, will find his *artavanité* officially recognized" (J. Kellens). Already at Behistun, Darius clearly expresses the link between a person's behavior on earth (relations with the king) and happiness/prosperity (*šiyāti*). In fact, he promises the person numerous descendants and long life, adding, "May Ahuramazda be a friend unto thee" (DB §60;♦ cf. §66). A contrary invocation is aimed at whoever would destroy the sculptures or would not care for them (§67). The idea of fecundity/prosperity is found again in Herodotus's version of Cambyses' last words (III.65). Darius's statement is expanded at Naqš-i Rostam, where the king promises to repay "him who cooperates" and punish "him who does harm" (DNb 5-13, 17-23♦). This promise is repeated, as we know, by Xerxes (XPl), who adds a clause giving it extra weight: "I generously repay men of good will" (XPl 26-31). These statements by Darius, repeated by Xerxes, are linked to the role of judge that the king assumed (DNb 5-15; XPl 5-17). If the king could act in this way, it was because he "regard[ed] himself as divinely appointed for a law (*nomos*) to the Persians, and the supreme arbitrator of good and evil (*aiskhva kai kala*)" (Plutarch, *Art.* 23.5♦). This is recognized as the giver/redistributor quality of the Great King, who rewarded the service of his own and severely punished rebel-Liars (see chap. 8/1).

In the last column, Darius goes further: "Whoever worships Ahuramazda, divine blessing will be upon him, both (while) living and (when) dead" (V §§73, 76). Xerxes takes another step by using the word *artāvā*. To earn the attribute of *artāvā*, a man must be both loyal to his king and faithful to Ahura-Mazda's law. In other words, passage from the world of the living to the world of the dead is mediated by the person of the king.

Ahura-Mazda and the daivā

The connections between the last column of Behistun and Xerxes' inscription do not stop with these considerations. It is in the same column (partly restored from XPh1) that Darius denounces the Saka and the Elamites as faithless (*arika*) because they do not worship Ahura-Mazda (V §71-76). Still more directly, a related idea is expressed by Xerxes when he claims to have destroyed the sanctuaries of the *daivā* to restore a cult in honor of Ahura-Mazda. The word *daivā* in particular is the starting-point for endless argument on the Zoroastrianism of the Achaemenids. In fact, we know that in the *Gāthā* the *daēuua* are described disparagingly, because their believers perform a bad ritual. This observation is doubtless the basis of the complementary references to the *daivā* and *artācā brazmaniya*, if we agree (which seems to be a given) that the phrase originally refers to correct methods of sacrifice: the *daivā* sectaries, in the *Gāthās*, are accused specifically of 'error, breach' (*aēnah*) because of the form of their sacrificial practice. It is thus confirmed that Xerxes principally had in mind the method of sacrifice to Ahura-Mazda. It does seem likely that this detail reflects a more rigid codification of an official cult in honor of the great Persian god, whose guarantor and maintainer Xerxes presents himself to be, even more firmly than had Darius.

The Land of the daivā: The King's Time and History's Time

Without claiming to have exhausted the debate, let us now return to the first of the three questions: Into what historical circumstances does the inscription fit? None of the proposals regarding the identification of the country in commotion is genuinely justifiable, first of all for the reasons that emerge from the above analysis of the relations between Xerxes and Babylon (the most frequent hypothesis); and the same rationale applies to relations between Xerxes and Egypt, as well as Media, Greece, or any other country. But the real question is this: Did Xerxes really intend to identify a specific country? If so, why did he not name it explicitly? In fact it remains deliberately vague; the syntax does not even make it certain that the place where the sanctuaries of the *daivā* were located was the very country that he says was in commotion (XPh §4b). Nor is it absolutely certain that the phrase “when I became king” refers specifically to the first year of his reign; it is a very vague chronological phrase that could just as well refer to any point during his reign, without any other detail (cf. XSc 2–5). Furthermore, internal examination of the inscription does not require a high date.

Xerxes' phrase is thus deliberately imprecise, both chronologically and geographically. This is not the only example. In one of the Susa inscriptions, Darius writes:

Saith Darius the King: Much which was ill-done, that I made good. Provinces were in commotion; one man was smiting the other. The following I brought about by the favor of Ahuramazda, that the one does not smite the other at all, each one is in his place. My law—of that they feel fear, so that the stronger does not smite nor destroy the weak. Saith Darius the King: By the favor of Ahuramazda, much handiwork which previously had been put out of its place, that I put in its place. A town by name . . . [PB: Susa], (its) wall fallen from age, before this unrepaired—I built another wall (to serve) from that time into the future. (DSe 001.22–35 [↔ Kent DSe §§4–5 lines 30–49])

The generality of the inscription does not permit us to deduce that Darius was specifically referring to the revolts of 522–521, which he describes much more precisely at Behistun. Furthermore, just like Xerxes, at Susa (in the Persian version: DSe §4.33) he uses the word *yaud* (‘agitation’ in a verb form), which is not exactly interchangeable with *hamiçiya* ‘revolt’, which in contrast is the word regularly used at Behistun to designate the rebellious countries warring against the king. At Susa, we have instead an exaltation of the transcendental virtues of the sovereign that by definition do not need to be illustrated with a historical situation. The sovereign is first and foremost the one who makes order proceed from disorder. The countries “in order” are those that follow the king's law and Ahura-Mazda's law. The word *dāta*, here as elsewhere, illustrates not a judicial-administrative state of affairs but a political-ideological depiction that challenges History.

Darius's statements at Susa obviously relate much less closely to those at Behistun than to the statements he had engraved at Naqš-i Rostam and that Xerxes adopted: “It is not my desire that the weak man (*skauði-*) should have wrong done to him by the mighty (*tunavant*); nor is my desire that the mighty man should have wrong done to him by the weak” (DNb 5–13; XPI 5–14). Clearly, in Darius's Susa inscription just quoted, he is not referring to rebellions against his authority but to the virtues of a king who guarantees the social and cosmic order, quite apart from any reference that might be precisely located in History's time. This sort of statement is also found in the *daivā* inscription, in a sentence that also does not provide much of a narrative: “And there was other (business) that had been done ill (*kartam*); this I made good” (XPh §4c). Even though the word *kar-*

tam is fairly vague in meaning, it very much looks as though here it can be understood as 'what I built', alluding to the virtues of the builder-king so abundantly attested at Persepolis and Susa—and this observation contributes to extension of the chronological range addressed in the inscription to the entire reign of Xerxes.

In the final analysis (without failing to recognize its originality), the *daivā* inscription fits perfectly into the corpus of royal inscriptions. Except for DB (and only in part, the part that was not necessarily most important to Darius), the royal inscriptions do not constitute narrative texts in the modern historian's sense. They are first and foremost ideological assertions that, situated in the King's time, do not fit into History's time. In other words, to use the inscriptions judiciously, the historian must understand that they never claim to preserve narrative or purely descriptive information. In the *daivā* inscription, Xerxes makes no allusion to a rebellious country or to royal activities specifically located in space and time. His inscription is instead intended to illustrate the permanence of his power and the transcendence of his royal virtues. The repetition of formulas borrowed from Darius contributes to anchoring this impression of permanence and at the same time further legitimates Xerxes' power. The most noteworthy difference is that the list of countries begins not with "These are the countries I conquered" but with "the countries of which I became king." Xerxes dwells on the inheritance from Darius by leaving the impression (by omission) that he had kept it intact. However, to boast more about the size of his Empire, he adds countries that had never been listed before him (the Dahae and Ākaufaciya), though we are not able (or necessarily required) to relate this reference to some fact located precisely in History's time.

Xerxes and Persia

These observations do not drain the *daivā* inscription of its historical interest. In fact, it expresses both the significance of Darius's legacy and the originality of his successor. Even if Xerxes was broadly inspired by Darius, he did not slavishly copy his father's statements. He added what must be considered ideological innovations, which completed the work on which his father had already made great progress. All in all, the *daivā* inscription gives the impression of accentuating the religious justifications for the power of a Great King, the true representative on earth of Ahura-Mazda, in whose worship he asserts his authority to intervene directly. But it is also clear that Xerxes' religious authority holds only in Persia—"this land"—with respect to Persians' worship of Persian gods. This restriction certainly held for the Persians of the imperial diaspora as well. Did Xerxes set about erecting sanctuaries for Ahura-Mazda in the Persian provincial communities and/or regulating ritual practice, in a way similar to what Artaxerxes II did later on, on behalf of Anāhita (chap. 15/8)? This is not impossible, but it must be recognized that we do not have any clear information in this area.

For a long time, a transformation in the titles in Babylonia has been observed, and more recent discoveries have confirmed this point. Added during year 1 to the traditional title used at the start of every reign, "King of Babylon, King of the Lands," is a more complex formula, such as "King of Persia, Media, and the Lands" or "King of Persia, Babylon, and the Lands." These changes certainly reflect some political intent, but what? For reasons already set out previously, a connection with a supposed overturn of the Great King's Babylonian policy seems unlikely. In fact, these modifications and adaptations took place before the revolts themselves. Let us emphasize that Xerxes was the

only successor of Darius to revive the sobriquet “Aryan of Aryan stock.” Moreover, the sole occurrence of the formula is in *XPh*. It was his intention to state still more strongly the ideological and political hegemony of the central authority of the Iranian countries—especially Persia proper. In a way, this titulature reveals both continuity with his predecessors and a toughening of the Achaemenid monarchic ideology.

Of course, Xerxes’ self-justification is, to an extent, as suspect as the systematic denigration of him found in the Greek sources. By itself it cannot provide us with a realistic picture of the relations between the central authority and the provinces, since the king was completely silent, for example, on the Babylonian revolts. The historian’s position is all the more difficult because the nature of the evidence prevents plunging into the details of regional daily life. Nonetheless, the official Achaemenid sources by their very existence serve to remind historians not to be satisfied with the panorama viewed from the heights of the Acropolis in Athens. They demand rereading the Greek, Egyptian, and Babylonian sources, which are all too often molded willy-nilly to the chapter so regrettably initiated by Plato on the theme of Xerxes and the decadence of the Achaemenid Empire.

The Builder King

At the same time, Xerxes ardently pursued construction at Persepolis, frequently putting his work in continuity with that of his father, as did all the kings after him. His activity as a builder is shown not only by the royal statements, from which we generally infer that Xerxes was responsible for completing Darius’s palace, but also by new structures such as the “Harem,” a new palace that was completed by Artaxerxes I (cf. *XPj*). Many sculptures were also finished during his reign. The excavations at Susa in the early 1970s have also shown that Xerxes’ efforts were not restricted to Persepolis. Thus far, two short inscriptions attest to Xerxes’ construction of a palace on the acropolis at Susa. We now know that he also completed the Darius Gate (*XSd*).

Xerxes’ activities are also demonstrated by the Treasury tablets. They show that activity continued uninterrupted. The earliest tablets date to 484–482 (PT 12–13, 15, 17, 18; PT 1957: 1), and there is a chronological concentration of tablets during the last years, 467–466, when groups of workers were frequently shifted around the Persepolis construction yards. As in the preceding period (PF), these workers come from various countries (Caria, Syria, Ionia, Egypt, Babylonia). Sometimes the workers simply have generic titles, such as “*kurtas* craftsmen” or “*kurtas* of the Treasury.” But they are also listed according to their technical specialties. It is quite striking to notice that these were basically not construction workers per se (although construction workers are found as well) but craftsmen working on decoration and finishing (sculptors in wood and stone, makers of iron and wood gates, specialists in inlaying precious stones, etc.).

8. Athenian Offensives and Royal Territories (478–466)

The Creation of the Delian League and the Royal Territories

All continuous narrative falls silent after 479 (chap. 13/1 above), so no narrative presentation of the years leading to the death of Xerxes can be offered. The nature of the evidence forces us to focus on events in Asia Minor. At the risk of boring the reader, we must once again emphasize that the situation in Asia Minor is known to us only from Greek sources that, generally speaking, are interested in spotlighting the victorious war

of liberation conducted by the united Greeks and Ionians against the Persians. Thucydides, for instance—the only one to provide a chronological framework (albeit often challenged)—had only one aim: to recount the great stages of Athenian imperialism.

The bare outline of the main events is well known, even though several noteworthy chronological obscurities remain. In the spring of 478, the Greek navy cast off once more, under the command of Pausanias. It consisted of Peleponnesian, Athenian, and “other allies” ships (Thucydides I.94.1♦)—that is, those of island cities that in the summer–fall of 479 “had now revolted from the king” (I.89.2♦). According to Diodorus, Pausanias’s mission was “to liberate the Greek cities which were still held by barbarian garrisons” (XI.44.1♦). And so it was in several cities on Cyprus. Then the squadrons took Byzantium, which could not resist long. Then comes the story of Pausanias of Sparta who, because he was suspected of collaborating with Xerxes, was recalled to Sparta. He was replaced by Dorkis. According to all of the ancient authors, Pausanias’s behavior had bothered the allies, so they turned to Athens for leadership, and the Spartan authorities decided to concentrate their efforts in the Peleponnesus once again. This is how what is called the Delian League was founded. It was financed by a tax levied on each member city in proportion to its resources; the most important cities furnished ships instead of money (Thucydides I.96.1).

The first question raised by the evidence is the extent of Persian territorial losses. Debates proceed apace about the composition of the League at its founding and afterward, but it seems clear enough that what Herodotus called (not without emphasis) the Second Ionian Revolt had no lasting effect on Persian positions on the mainland. The Greeks knew the power of the Persian army, and the harsh punishment imposed on Didyma implies that Miletus itself remained under Achaemenid dominion. At first, the Delian League essentially consisted of island members. It does not appear that the Athenians attempted to extend their operations on the mainland any further after 478. In addition to Byzantium, the Greeks succeeded in taking Eion, one of the Persian garrisons remaining in Thrace, after a long siege (476?). On the other hand, despite all their efforts, they failed at Doriscus, as stressed by Herodotus, who notes that Mascames the governor successfully resisted; “this is the reason for the annual present from the Persian king” (VII.106♦). According to Thucydides (I.94.2♦), the Greeks also “subdued most of the island” of Cyprus. But this statement can scarcely be believed. Diodorus mentions only the expulsion of barbarian garrisons from several cities (XI.44.2). The Greek navy was not strong enough and the expedition was too short to make total subjection of the island possible. What is more, the isolated successes of 478 were without sequel. It seems in fact that the Persians managed to take back control of the Cypriot kingdoms during the 470s. Last, it is entirely in character with the times that, until the campaign of the Eurymedon in 466, Thucydides does not mention a single Athenian offensive expedition in Asia Minor; after the taking of Eion, the only campaigns he notes are against Carystus on Euboea and then against Naxos; but the latter already belonged to the League and had tried to throw off the Athenian yoke (467–466; I.98), so this was not a matter of territorial expansion.

What Thucydides says about the reasons for the creation of the League must also be stressed: “Their professed object (*proskhēma*) being to retaliate for their suffering by ravaging the king’s country” (I.96.1♦). There is no compelling reason to doubt Thucydides here. Even though the League is presented later on as the instrument for the liberation

of the Greek cities of Asia, this perspective was not relevant in the 470s. Athens did not have the resources to support such a policy. The tribute levied in 478 could not sustain a permanent naval force capable of successfully facing the fleets that the Great King could mobilize in an instant. The main objective of Cimon's expeditions in the 470s seems to have been to collect booty to pay his forces (Plutarch, *Cimon* 9.6). The taking of Naxos (466–465) is what Thucydides gives as the beginning of a gradual change. He highlights the policy of some allies who preferred "to pay their share of the expense in money instead of in ships, and so to avoid having to leave their homes. Thus while Athens was increasing her navy with the funds which they contributed, a revolt always found them without resources or experience for war" (1.98.3♦). It was thus only gradually that the Athenian tribute system—adapted from the Achaemenid system—produced results favorable entirely for Athens.

Of course, Thucydides' tale is partial (and does not pretend otherwise). He selected facts that appeared to illustrate the stages marking Athenian imperialism. But there are no other sources that would permit us to reach dependable conclusions. In particular, it is very dangerous to reconstruct the expansion of the League back to its beginnings by calculating backward from the first "Athenian tribute lists" (ATL), the first of which dates to 453. That mainland towns entered the Athenian League is beyond doubt, but which towns and when? In a famous passage in the *Life of Cimon* (§12), Plutarch, like many other ancient authors, extravagantly praises Cimon's conquests:

Nor did any man ever do more than Cimon did to humble the pride of the Persian king. He was not content with getting rid of him out of Greece; but following close at his heels, before the barbarians could take breath and recover themselves, he was already at work, and what with his devastations, and his forcible reduction of some places, and the revolts and voluntary accessions of others, in the end, from Ionia to Pamphylia, all Asia was clear of Persian soldiers. (12.1♦)

The significance of this passage for Achaemenid history depends on the date assigned to it. Plutarch had no problem placing this campaign just before the battle of the Eurymedon in 466, which he describes at length. It is the same in Diodorus: after reinforcing his fleet at Athens, Cimon set sail for Caria:

He at once succeeded in persuading the cities on the coast which had been settled from Greece to revolt from the Persians, but as for the cities whose inhabitants spoke two languages and still had Persian garrisons, he had recourse to force and laid siege to them; then, after he had brought over to his side the cities of Caria, he likewise won over by persuasion those of Lycia. (XI.60.4♦)

Doubts have been expressed that Cimon could have accomplished all these conquests in a single campaign in 466. To tell the truth, there is no way to say with certainty. In any case, even if we acknowledge that Plutarch and Diodorus are referring to actions carried out several years earlier, we may legitimately question the breadth assigned to them, expressed in stereotypical formulas. It is clear that the *Life of Cimon* is nothing but a long eulogy, which emphatically praises the great deeds of a man "after [whose] death there was not one commander among the Greeks that did anything considerable against the barbarians" (19.3♦). Moreover, even Plutarch's version reports as much raiding and plunder as conquests proper. He also reports resistance against the Athenian offensive. The case of Phaselis (located exactly in the context of the Eurymedon campaign) clearly shows that the cities were far from agreeing to surrender voluntarily: "though inhabited

by Greeks, yet would not quit the interests of Persia, but denied his galleys entrance into their port. Upon this he wasted the country, and drew up his army to their very walls" (§12.4♦). While it is not possible to achieve certainty on the extent of Persian losses, both Plutarch and Diodorus imply that, at this time (which may be 466!), many mainland cities remained in the Persian orbit and, furthermore, Achaemenid garrisons were scattered throughout.

The Eurymedon and Its Consequences (466–465)

The Great King was not unaware that at the same time the Athenians were experiencing increasing difficulties with their most powerful allies. In the passage devoted to this development, Thucydides names the revolt of Naxos, "the first instance of the engagement being broken by the subjugation of an allied city. . . . Next we come to the actions by land and by sea at the river Eurymedon" in Cilicia (I.98.3; 100.1♦). The island was once again conquered by Cimon in 467. During this time, the Achaemenid general staff had gathered vast assemblies of troops in the Cilician, Cypriot, Phoenician, and Pamphylian bases (Diodorus XI.60.5; Plutarch, *Cimon* 12.2). High-born generals had been selected by the king: Ephorus names Tithraustes, who headed the royal navy, and Pharrandates, who headed the ground troops (*Cimon* 12.5), the former presented as an illegitimate son of Xerxes (Diodorus XI.60.5). Callisthenes names Ariomandes, son of Gobryas, as supreme commander (*kyriotatos*) of the Persian forces (*Cimon* 12.5). The breadth of the preparations and the quality of the commanders show that the king was not content with a defensive strategy but that he intended to lead a counteroffensive in order to profit from the Athenian troubles. The various confrontations proved favorable to Cimon, on both land and sea.

This success of Cimon so daunted the King of Persia that he presently made that celebrated peace, by which he engaged that his armies should come no nearer the Grecian sea than the length of a horse's course, and that none of his galleys or vessels of war should appear between the Cyanean and Chelidonian isles. (Plutarch, *Cimon* 13.4♦; cf. 19.4)

Even though Plutarch emphasizes the scope of the victory at the Eurymedon, he also notes that Callisthenes said nothing of such a treaty but that the king meanwhile "kept off so far from Greece that when Pericles with fifty and Ephialtes with thirty galleys cruised beyond the Chelidonian isles, they did not discover one Persian vessel" (12.4♦). Plutarch says he chose the version with a treaty because its text was included in the collection gathered by Craterus. Plutarch is responsible for starting the familiar debate on the Peace of Callias, which is most often dated to 449–448 and attributed to the mediation of Callias (Herodotus). But was such a peace ever concluded? And was Callias's embassy simply a renewal of an accord sealed in 467–466, shortly before the death of Xerxes?

I have no intention here of reopening the entire, extremely complex debate; a torrent of writing has already washed up utterly contradictory opinions. The principal arguments pro and con are well known. Pro: (1) We find the Greek sources to be relatively coherent on this subject—so much so that it seems difficult to believe it was simply invented by fourth-century historiography, however rich it is in errors of every kind; (2) the king and Athens would both have found it advantageous to conclude a treaty after the Eurymedon. Con: (1) Theopompus states that the treaty is a forgery; (2) Thucydides does not mention it; (3) we cannot see why Athens and the Great King would have

behaved thus; (4) it was not customary for the Achaemenid court to conclude such treaties. Each argument, as is well known, can be completely turned on its head, since at the present time no “proof” is generally and unreservedly convincing. Let us at least agree that there was merely an agreement in fact (and not *de jure*), as a result of the initiatives of the Greek generals and the satraps, even though this is a somewhat desperate solution that cannot in itself illuminate everything.

The basic question lies in the realm of strategy and policy: What form could such an accord have taken, and was it in the Great King’s interest at this time? Plutarch’s answer cannot satisfy us (the king was utterly daunted by the defeat). It fits too well into the imagery of Xerxes and the propagandistic frenzy after the victory at the Eurymedon to be convincing. Testing other possible solutions raises quite a few difficulties, however, especially chronological problems. As anyone can see, after the battle Cimon did not seek to take advantage of the victory, but on the contrary merely skirted the coast of Thrace. There he conquered the Persians who were resisting, aided by Thracians, then sailed for rebellious Thasos (Plutarch, *Cimon* 14.1–2). But dating the Thasos revolt remains problematic because of the vagueness of Thucydides’ phrasing: “Some time afterwards occurred the defection of the Thasians” (I.100.2♦). If we agree that the Thasian revolt does date to the period immediately after the Eurymedon, we must then also agree that the Great King, despite his defeat, had no reason to subject himself to such a humiliating treaty, since Athens again found itself in a situation as difficult as in 467, after the revolt of Naxos. Furthermore, other fronts were again demanding Athens’ attention back in Greece, and the city was soon to suffer an unprecedented disaster in Thrace (Drabescus; Thucydides I.100.2; IV.102).

But Diodorus (who dates the aforementioned peace to 449–448) recounts the Persian reaction after the battle of the Eurymedon entirely differently from Plutarch: “But the Persians, having met with so great reverses, built other triremes in greater number, since they feared the growing might of the Athenians” (XI.62.2♦). Diodorus (doubtless relying on Ephorus) reverts to this in his presentation of the beginning of the reign of Artaxerxes (465): “Artaxerxes . . . concerned himself with both the revenues and the preparation of armaments” (XI.71.2♦). The second passage, to be sure, could be related to the Egyptian rebellion. However, since the Egyptian rebellion did not break out before Xerxes’ death (71.3), and since, therefore, the king could not have decided to put down his arms or to fall shamefully back from the coast of Asia Minor after the Eurymedon and allow an Athenian navy to grow there without opposition while it was occupied with more urgent tasks, it seems difficult to date the treaty (if there ever was one) after the Eurymedon.

The Case of Lycia: Text and Image

It is difficult to find any other access point, because the sources are so impoverished. Between the battle at the Eurymedon and the death of Xerxes, the Classical sources are silent on Greco-Persian relations and thus on the gains and losses of royal territory in Asia Minor during this period. A preliminary assessment cannot be compiled until 453, when the Athenian Tribute List (ATL) series begins. As has already been noted, however, any backward argumentation on the basis of such a source is burdened with a high level of uncertainty. For instance, we know that the Lycians provided ships to Xerxes in 480 but paid tribute to the Delian League from 452/451 to 446/445, along with the Tel-

messians. But at what date did the Lycians switch from the Persian to the Athenian side, and what were the implications of such a change? It is generally thought that the new ties to Athens were due to the activity of Cimon before and after the Eurymedon, activity that can be confirmed archaeologically in the destruction layers at Xanthus. But the so-called destruction layers are themselves dated by reference to the supposed activities of Cimon, so the mutual support of textual and archaeological "facts" turns out to be illusory.

Iconographic studies are also full of traps, insisting now on Athenian influence, now on Achaemenid. But what cultural relationship can be established between iconographic borrowing and Achaemenid political influence? Perhaps there was none to speak of, especially if we agree that these works were produced at a time when Lycia was free of the Persian yoke. We must stress, on the one hand, that there is not a single exact copy of an Achaemenid model; however, there was selective borrowing of elements from the Persepolis iconographic repertoire. Attic influence is also very clear, as much in the execution of some reliefs as in the choice of some images. We have another illustration in the evidence of increasing flow of imports of Attic pottery at the site of Xanthus. In a way, the Lycian example shows that the Hellenization of Lycia proceeded side by side with its Iranization, both being grafted onto a Lycian stock that remained extremely vital. The Lycian dynasts and aristocrats borrowed the elements of an Achaemenid iconographic repertoire that allowed the dynasts to exalt their political status within Lycian society and the aristocrats to depict a lifestyle punctuated by banqueting and the hunt. It is quite striking to observe that the buildings at Xanthus, generally dated later than 480–470, show very prominent Achaemenid influence. But this appropriation does not necessarily imply political subjugation, any more than the adoption of Greek motifs presupposes some sort of allegiance to Athenian interests in the region.

9. Xerxes' Western Strategy

Xerxes and the Asia Minor Satrapies

In order to make progress, it will be prudent to adopt complementary access points, beginning with one simple observation, suggested by the preceding discussions: we must assume that, faced with Athenian offensives, the imperial authorities (both central and satrapal) devised a strategy. Attempting to reconstruct the strategy might appear to be quite a challenge, since the Greek sources cared not a whit about it. At most, we learn from Diodorus that before leaving Asia Minor, Xerxes "left a portion of his armament in Sardis to carry on the war against the Greeks" (XI.36.7♦). Only by gathering fragments of information can we see that the Great King then, or a little later, took a series of actions—apparently disparate but only because of the character of our evidence. These actions are in fact very widely cited by the Greek authors outside the context of the confrontation of the 470s. For example, in Xenophon's description of the march of Cyrus the Younger, he mentions in passing, regarding Celaenae: "It was here also, report has it (*legetai*), that Xerxes, when he was on his retreat from Greece after losing the famous battle, built the palace (*basileia*) just mentioned and likewise the citadel of Celaenae" (*Anab.* I.2.9♦). When we recognize the strategic importance of this city, it is hard not to see in this comment an echo of Persian military reinforcement.

Herodotus mentions a royal decree during his recounting of the Masistes romance. He reports that a Halicarnassian, Xenagoras, son of Praxilaus, had saved the life of

Masistes and that “this action won Xenagoras the favour not only of Masistes himself but also of Xerxes . . . ; and he was rewarded for it by a gift from Xerxes of the governorship of the whole province of Cilicia” (IX.107⇨). Obviously this information must be set within what little we know of the Persian occupation of Cilicia at this time (chap. 12/5). It seems impossible that a Carian would have been named satrap. We know on the contrary that it was family ties between the Syennesis family and the Carian dynasts that were old and close, since around 500 “Pixodarus, son of Mausolus, a man of Cindya, had married a daughter of the Cilician king Syennis” (V.118⇨). Perhaps it was after the death of the Syennesis at Salamis that Xenagoras laid claim to his dynastic rights. Under this hypothesis, it was the Great King himself who made the decision. This would not be the only example of this sort of direct intervention, since the Saka campaign of Darius resulted in the replacement of one rebel king (Skunkha) with another, in accordance with the Great King’s wishes (DB V §74). The same thing was done at Cyprus during the Ionian Revolt (Herodotus V.115). Under this hypothesis, the naming of Xenagoras was tantamount to asserting royal presence in Cilicia. We may presume that this decision by Xerxes fitted into an overall plan that had the more specific intention of better protecting and controlling Cyprus, which was threatened by the Athenian offensive of 478. It is also likely that this decision fostered ties with Caria. Although we know nothing of Artemisia after Salamis, it is clear that she remained the king’s faithful ally, since he made her the guardian of his illegitimate sons (Herodotus VIII.101–3). There is in fact nothing to indicate that Halicarnassus and the Dorian cities that were its dependencies (VII.97) belonged to the Delian League from the start; quite the contrary, the discovery of a potter’s vessel inscribed with the name of Xerxes “Great King” in the city (Posener no. 51; XV₆) leads us to think that ties with Persia were not loosened (but we must recognize that the evidence is slight).

Xerxes’ concern to maintain the Achaemenid position in Asia Minor is also well illustrated by the decisions he was soon to make in Hellespontine Phrygia. Thucydides, in his very important excursus on the adventures of Pausanias, in fact mentions that then (478–477) “Xerxes . . . sent off Artabazus, son of Pharnaces, to the sea with orders to supersede Megabates, the previous governor in the satrapy of Daskylium” (I.129.1⇨). Artabazus was a high-ranking person since his father, Pharnaces, is probably none other than the Parnaka of the Fortification tablets—that is, Darius’s uncle. Artabazus took part in the campaign of 480: he accompanied Xerxes as far as the Straits, then left the battlefield of Plataea after a disagreement with Mardonius about strategy. His appointment to Dascylium began a long stretch of satrapal government retained in the same family. Thucydides says simply that Artabazus was ordered to communicate with Pausanias. But the royal order was certainly part of a larger strategic undertaking, especially at a time when the Persians had lost Sestos and Byzantium. The fact remains that the “royal presence” at Dascylium is well illustrated by the inscribed bullae discovered in 1952–55 (but still unpublished), which constitute residual traces of the satrapal archives. Several of them have royal motifs (the “Royal Hero,” fig. 56b, p. 700) and inscriptions in Old Persian: “Xerxes the king.”

Xerxes and Pausanias

It is time to take up the story of Pausanias, since it provides a very fine illustration of another of Xerxes’ trump cards, the allegiance of some Greeks. According to Thucydides, Pausanias was given the command of the Greek navy in 478, but after Byzantium

was taken by the Persians, he was recalled to Sparta. He had aroused the opposition of the allies because he exercised authority "tyranically." Moreover, he was accused of "Medism," "to all appearances one of the best-founded charges against him. The Lacedaemonians did not, however, restore him to his command" (I.94.3-6♦). This "Medism" is explained further on: after the capture of Byzantium, Pausanias had returned the high-ranking Persian prisoners to Xerxes; among them were relatives and allies of the king's family. With the Greek Gongylus as intermediary, he had also sent a letter to Xerxes requesting the hand of Xerxes' daughter and offering in return "to make Sparta and the rest of Hellas subject to you" (I.128♦). Xerxes delightedly sent Artabazus to Dascylium with the reply, assuring Pausanias of recognition and asking him to collaborate with Artabazus, promising him great sums of money and extensive support. Puffed up with pride, the Spartan adopted the lifestyle of the Persian nobles: "He went out of Byzantium in a Median dress, was attended on his march through Thrace by a body-guard of Medes and Egyptians, kept a Persian table. . . . He also made himself difficult of access." This aroused the ire of the allies and resulted in his recall to Sparta (I.128, 129.1♦). Despite the accusations, he was acquitted and, acting as a private citizen, took to the sea again toward the Hellespont (I.128.3); driven out of Byzantium, he set himself up at Colonae in the Troad, where, they say, he "was intriguing with the barbarians." He was then recalled again to Sparta and convicted, particularly because he was accused further of "intriguing with the Helots" (I.131-34♦).

Some of Thucydides' discussions have long given rise to suspicion, not least because Herodotus says that Pausanias intended to marry a daughter of Megabates, a cousin of Darius, who doubtless can be recognized as Artabazus's predecessor (though Herodotus adds, "if what they say is true"; V.32)! It is clear that nearly fifty years later the image of Pausanias had become symbolic in Greece, particularly his adoption of Persian customs. But Thucydides' tale rings substantially true, so there is no reason to deny the exchange of letters between Pausanias and Xerxes. We can see perfectly the advantages that the Persians could have drawn from his agency, since they were already accustomed to using skilled Greeks in their service—which was what the Greeks called "Medism." According to Justin (IX.1.3), "Byzantium, originally founded by Pausanias, king of Sparta, remained in his power seven years." If this information is correct, we must understand that he was installed in this city by the Persians, just as they had installed tyrants elsewhere, and that he remained there between ca. 478/477 and 472/471. The takeover of Byzantium doubtless allowed the Persians to mount a counterattack in Thrace, an attack that also depended on their base in Doriscus.

Gifts of Lands and Towns: Colonization and Territorial Control

Xerxes could count on the support of additional Greeks. Thucydides mentions Gongylus as well, the person who acted as intermediary between Pausanias and the Great King (I.128.6). From a casual remark by Xenophon about the campaign led by the Spartan Thibron in Aeolis at the very beginning of the fourth century, we learn a bit more about this person:

Gorgion and Gongylus gave their allegiance to Thibron, they being brothers, one of them the ruler of Gambrium and Palaegambrium, the other of Myrina and Crynium; and these cities were a gift from the Persian king (*dōron para basileōs*) to the earlier Gongylus, because he espoused the Persian cause, — the only man among the Eretrians who did so, — and was therefore banished. (*Hell.* III.1.6♦)

We know that in 490, in Eretria, Datis had found rich inhabitants who would have turned over the city to him, "having an eye to the main chance— . . . for Persian pay" (Herodotus VI.100–101♦). But Gongylus's "treason" dates instead to 480. This was the year he returned with Xerxes and so was able to serve as intermediary to Pausanias. Other Greeks were rewarded at this time, such as Theomestor, who was installed by the Persians as tyrant of Samos, and the other Samian, Phylacus, who "was enrolled in the catalogue of the King's Benefactors and presented with a large estate (*chōra*)" (VIII.85♦). In the same *Hellenica* passage, Xenophon also cites the case of other towns that fell into the hands of Thibron: "Pergamus by voluntary surrender, and likewise Teuthrania and Halisarna, two cities which were under the rule of Eurysthenes and Procles, the descendants of Demaratus the Lacedaemonian; and this territory had been given to Demaratus by the Persian king as a reward (*dōron*) for accompanying him on his expedition against Greece" (III.1.6♦). We know that Demaratus had arrived at the court earlier, during the reign of Darius, "who welcomed him with a magnificent gift of land and cities" (Herodotus VI.70♦). But the gift referred to by Xenophon was clearly a new reward granted to him by Xerxes, because we know that Demaratus was at the king's side during his expedition in 480.

These gifts forcefully illustrate the king's policy of attracting Greeks to his service. As it happens, the gift of towns was not entirely new. We know that Cyrus had already favored one Pytharcus of Cyzicus in this fashion, in a historical context that we cannot precisely identify but that probably fits into the conquest of Asia Minor (Athenaeus I.30). In exchange, the concessionaires became faithful clients of the Great King, to whom they were also linked by military obligations: they were an integral part of the system by which the royal territories were occupied. These clients can be compared with Zenis and his wife Mania of Dardanus, who under Pharnabazus's authority administered (*satrapeuein*) part of Aeolis at the beginning of the fourth century, in exchange for which they were obligated to pay tribute from their territory and to furnish military contingents (Xenophon, *Hell.* III.1.10–15). Indeed, it is noteworthy that the towns granted both to the Gongylids and to the Demaratids were all in the Troad, in the part that, as we have just seen, was a dependency of the satrap of Hellespontine Phrygia. It is no less noteworthy that Coloniae, the town where Pausanias established himself after leaving Byzantium, is also located in the Troad: it was one of the three towns taken by Mania in the name of Pharnabazus II (*Hell.* III.1.13). It is hard to believe that this was coincidental. The Troad and its neighbors (Aeolis) constituted a region of the utmost importance: one of the main Persian naval bases was at Cyme of Aeolis, commanded by a specific hy-parch (Herodotus VII.194); this is where the Persian fleet was moored when it returned from Salamis. The region was also rich in timber, as Pharnabazus says (*Hell.* I.1.22). Herodotus's story of Xerxes' march from Sardis to the Hellespont is also rich in information. The caravan set out toward the valley of the Caicus and Mysia, passing successively by Atarnaeus, Thebe, Adramyttium, and Antandrus before arriving at the plain of Ilion on the banks of the Scamander (VII.42). It was in "the Pergamum of Priam" that the king sacrificed to Athena Ilias and that the *magi* poured libations in honor of the heroes ("Asiatic" heroes of the Trojan War).

After Cyrus, on the other hand, islands received land on the mainland. For example, around 545, Chios received the region of Atarnaeus in Mysia from Mazares (Herodotus I.161), a territory where the Chians retained interests throughout the fifth century and

where exiles sought refuge. Other incidents show that during the period of Athenian dominion the Persians could intervene in this way—directly or indirectly—in the island cities close to the coast. There is little doubt that the territories mentioned above were placed under the command of Artabazus, the new satrap of Dascylium. Perhaps it was at his initiative that someone named Arthmios, from Zeleia, was sent with money to the Peloponnesus to support some allies.

We must thus conclude that royal concessions were part of a strategic design to protect Achaemenid interests in a vitally important region. This colonization movement did not contradict the expansion of the imperial diaspora; on the contrary, it reinforced it. Persian colonies were founded in particularly large numbers in the valley of the Caiucus and its tributaries.

Themistocles at the Court of the Great King

Xerxes won a new Greek ally in the person of his opponent of the 480s, Themistocles. The victor of Salamis, banished from Athens, first sought refuge at Argos; then, pursued by the Athenians, he reached Macedonia. There he took ship at Pydna, made the crossing off Thasos (then under siege by the Athenians), and landed at Cyme in Aeolis (Plutarch, *Them.* 26.1). We may note in passing the reaction of the Greek inhabitants of Cyme, who tried to capture Themistocles, a man with a price placed on his head by Xerxes. Themistocles then fled to Aegae, a small town of Aeolis, where he made contact with his host, Nicogenes, “who had relations among the powerful (*dynatoi*) of the High Country,” which probably means that they were Persians of the court of Dascylium. This episode confirms the importance of Artabazus and his satrapy in the strategy developed by Xerxes after 479 in Asia Minor, and it was Artabazus who authorized Themistocles to meet the king in an official caravan (*Letter Them.* 30).
